When Buying a Piano
Think More "How Good" Than "How Cheap"

Pianos like everything else are priced according to their intrinsic worth.

When you buy a piano it is usually intended for a life time—then special care should be used in its selection.

It is to your interest to go to a reliable dealer, and when making your selection think more of how good a piano you can get than how cheap you can buy it.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, Player Music, etc.

WHO'S GROWING OLD?

I know a man of forty-five,
They call him Old Man Clover;
He isn't sure that he's alive,
Or that the war is over.
"When I was young," he lately said,
"I was a lively fellow,
But now I see the end ahead;
I'm in the sere and yellow."

When I encounter such a jay
I think of Annie Rainey,
Just one-and-eighty to a day,
Awake, alert and brainy;
Not over-strong of body, yet
She spends no time a-dreaming;
You couldn't fool her on a bet
With any sort of scheming.

The one reads hymns and epitaphs,
The other reads the papers;
The Old Man weeps, the other laughs
At little children's capers.
The one looks back, the other sees
Into the bright Tomorrow,
She's living day by day, while he's
Immersed in musty sorrow.

Young optimist, a health to you
Old Father Time is kidding;
Your course is straight ahead and true,
'Tis Old Man Clover's skidding..
Pay no attention to the jokes
The calendars print yearly;
They're meant for clock-observing folks,
Who measure Life most queerly.
—Charles B. Driscoll.

A FATHER AND HIS BOY

THIS is an account of a farm father who is trying to keep his boy on the farm. From present indications we believe he will succeed. Consequently, an account of the method he employs may hold helpful suggestion for other farm fathers who look forward with somewhat of dread to declining years and the day, when for lack of sons or sons-in-law who are interested in agriculture, they must rent the farm to strangers or to such as can do the physical work which it demands.

The father in question has put in the best years of his own life developing a farm of between 200 and 300 acres in a fertile and productive region of the Middle West. He has spent close to a quarter of a century establishing a herd of milking Shorthorns. There are three daughters and one son in the family. Building hopes on future sons-in-law is considerable of a venture, inasmuch as girls are quite as likely as boys to have a leaning toward city life. Consequently, this father has felt that the only sure way of keeping the farm in the family would be to create in the boy a love and a liking for the farm, a liking so deep that the lure and call of the city would make no permanent or lasting impression.

Off and on for a couple of years the writer had noticed an announcement in agricultural papers of this particular man's herd of milking Shorthorns. The advertising bore a name for which we will substitute that of "Smith." It is of more interest to note, however, that in connection with his own name the father coupled that of his son. Thus the firm name read, "R. W. Smith & Son." It is upon this fact that our story hangs

Recently, being within ten or a dozen miles of the farm we decided to pay it a brief visit. The elder Smith kindly responded to our suggestion made over the telephone and came after us with his automobile.

"My boy would have come but he is helping a neighbor thresh," he informed me as we rode along.

"Is your other son at home?" I ventured in order to make conversation, "the one associated with you in your Shorthorn business?"

"Oh, this is the one—the only son I have," he corrected.

"How old is he?"

"Well, he's getting to be quite a boy," the father replied with just a trace of pride. "He'll be finishing high school in a year or two."

We were beginning to get our bearings. The man at the steering wheel believed evidently in taking his son into the business instead of simply developing a business and presenting it to him by means of a last will and testament.

"I'll just leave you here," he said as we drew up at the farm, "while I run over with the car and take the boy's place on the stack. He'll be right back in the machine. I want him to show you the stock himself. This is his end of the business, you know."

Here certainly was something new—a father who would take his boy's place in a threshing crew in order that the former's sense of ownership might be deepened and gratified through the exhibition of the stock on the place to a total stranger.

In a few moments the auto returned with the junior Smith at the wheel. He was a "boy" sure enough; already, however, the "son"—from a purely business standpoint — was showing abundant signs of promise. We hadn't talked with him five minutes before we found that he had everything connected with the dairy end of the farm at his fingers' end. Furthermore, he appeared to have acquired the sense of ownership which was the aim of his father—also the pride which rightly accompanies an accomplishment that is worth while.

"See that cow over there," he pointed. "She's 12 years old but she's gone 6300 pounds of milk to the middle of August and her year won't be up until the twenty-first of November. She'll go better than 8000 pounds by that time—better than some of your Guernseys."

We passed from one point of interest to another about the place—the "boy" and "son" explaining meanwhile.

"Father's given me this end of the business to run," he volunteered. "I get along all right when there isn't any school but there's times when I have to have an extra man in the barn in order to keep up with my books. Still, I make all the tests and keep all the records. See! Isn't that a fine bunch of yearling bulls? I'll be selling some of them pretty soon."

We were beginning to think that already there was more of the "son" than there was of the "boy."

"How old are you?" we queried of the lad before us, trying not to be too much interested in his answer.

"Pretty near old enough to go up to Madison to the agricultural school," he replied with a grin.

Then we knew that this boy would stay on the farm.—Successful Farming.

THE NEW COOK

The lumber barge "Lucy" had been loading all morning at the Delat company's wharf. The sweet smelling smooth pine boards were piled high upon her deck, and in the little wharf office Captain Swanson sat in a swivel chair looking out at the stevedores, who bending beneath the long loads they carried on their shoulders, moved hither and thither before him, living symbols of labor.

As he gazed out of the window, a knock fell upon the door, and he shouted a gruff "Come in."

The man who entered was unkempt, short and red faced.

"I seen yer advertisement in th' paper," he said, "'bout yer wantin' a cook, an' come down t' see if you had one yit."

"Are you a cook?" the captain inquired.

"Yer bet I be; I'm about th' cookiest cook that ever trod a deck. Is th' job open?"

It was; indeed, the loss of his cook had seriously disturbed Captain Swanson. The stranger was engaged.

"Better git right down in the galley and git dinner," the captain said.

"Whattel I give 'em?" the stranger asked.

"Oh, give 'em rice; that's fillin'."

"All right; how many be they t' feed?"

"Twenty-five," he replied.

The stranger disappeared in the hold of the boat. He found a huge bag of rice and an old pair of scales. Filling a wash boiler with water, he set it on the fire. He weighed out 25 pounds of the rice and dumped it into the boiler. He discovered salt, and added that. And then he sat on a keg and waited "fer her t' bile."

Presently "she" began. Up, up, nearer the top of the boiler rose the rice. The cook seized a dipper and a pan and dipped out a quantity of the rice. Again it boiled up. He seized another pan. It was boiling over faster than he could dip. Every dish and pan in the galley was filled. He turned over the keg on which he sat and filled that. Still the miraculous boiler continued to boil over. At last in sheer despair and fright he rushed upon the deck, crying:

"Mate, mate! Fer th' love o' Heaven, don't take on enny more lumber; we gotta cargo o' rice."

And with that he was over the rail and speeding up the wharf. The next day another advertisement appeared in the Gazette, asking for a cook on the barge "Lucy."

MORE MEAT SUBSTITUTES

Beans and Rice

Two cups cooked kidney beans, two cups cooked rice, four cups tomato sauce.

To make the tomato sauce: Brown three tablespoons of flour in one-fourth cup of drippings or vegetable oil and mix with one quart of strained tomatoes and one tablespoon grated onion. Cook sauce five minutes; combine hot rice and beans; pour over them the hot sauce and serve.

Creamed Peas or Beans

One pint dry peas or beans, one-half cup milk, one teaspoon drippings, two teaspoons syrup, one teaspoon salt, pinch red pepper.

Soak beans in cold water over night or until hulls rub off easily; rub between hands until all skins are removed; boil slowly with just enough water to cover them until thoroughly done; pass through a ricer; add other ingredients; whip as for creamed potatoes; serve hot.

Fish Kedgeree

One and a half cups flaked cooked fish, one egg, four tablespoons rice, one teaspoon chopped onion, salt and pepper to taste, two tablespoons dripping.

Wash rice and drop slowly into fast boiling water, with a teaspoon of salt, and boil fast until tender (about twenty minutes). Drain well, and dry in a colander. Boil the egg hard, cool it in cold water, and chop it coarsely. Melt the fat in a saucepan, stir in the cooked rice, add the fish and seasoning. Make it very hot, then add the chopped egg, and serve at once.

If onion is liked, fry it lightly in the fat before putting in the rice.

DRIED POTATOES—EATABLE AND UNEATABLE

READERS of this page will recall request of subscriber for some method of cooking dried potatoes that would make them eatable. Here is another:

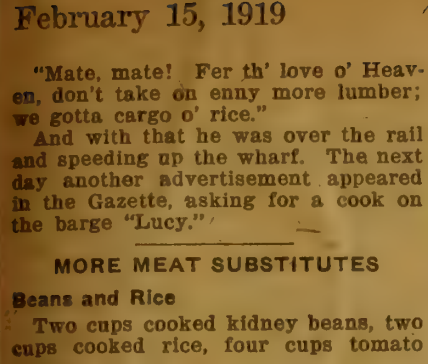
In your January issue advice was given how to cook dried potatoes, but after being soaked in water two days and cooked one day they are still as hard as pieces of leather.

How we dried them: First peeled and washed the potatoes, then sliced about one-fourth inch thick, then spread on trays and sulphured like peaches. They evaporated in the sun nicely and came out white and nice, but refused to be cooked. Where is the mistake? If you can give me the address of some person who really knows how to evaporate Irish potatoes I would be very thankful, and it would prove an economical blessing for us San Joaquin farmers, as we cannot keep fresh potatoes very long. Sometimes sacks of fine spuds must be thrown to the hogs after being dug a short time.

Of course if spuds must be cooked first before drying it would require factory facilities and would be out of the question for farmers.—Subscriber, Turlock.

This problem was presented to Prof. W. V. Cruess of the state university, who has been for years making study of methods of preserving foods, and he writes:

"At the time the university's publication appeared on the drying of potatoes, the sulphuring process was the only one in use. This process of treating potatoes before drying was used on a very large scale during the Klondike days. When the war broke out this method was used at first for preparing potatoes for army use and was the one recommended in bulletins appearing upon the subject of vegetable drying. However, it was soon found that potatoes dried after sulphuring were as tough as leather and could not be softened by any length of boiling. Experiments performed, however, by a number of experiment stations, including the University of California, showed that a very attractive and easily cooked product could be made if the potatoes were first subjected to a steaming or a boiling process before drying. This process, briefly outlined, is as follows:



"Peel the potatoes and slice them about three-sixteenths of an inch thick. Dip them in boiling water for three minutes. Stir them constantly while in the water. Remove them, spread on wire screen trays, and dry in an artificial evaporator at not above 150 degrees Fahrenheit until bone dry. If dried in the sun, potatoes will not have as pleasing a flavor as if artificially dried. We do not recommend sun drying for this reason. If you desire to turn out a first class product, the potatoes must be dried artificially.

"I have assisted in the drying of a good many tons of potatoes by this process and have personally used them on camping trips. We have soaked the potatoes during the night and fried them for breakfast with excellent results. The potatoes have a flavor and appearance equal to the fresh article. We have also used them for potato soup at home and have used them for mashing purposes after boiling. They will cook just as rapidly as fresh potatoes."

EPITAPHS IN THE CEMETERY OF FAILURE

He lacked tact.
Worry killed him.
He had no reserve.
He lacked stamina.
He couldn't decide.
He was too sensitive.
He couldn't say "No."
He was almost a success.
He did not find his place.
He clung to his prejudices.
A little success paralyzed him.
He was strangled by selfishness.
He failed to digest his education.
He was too proud to take advice.
He did not guard his weak point.
He did everything "just for now."
He lacked the fire that kindles power.
He did not fall in love with his work.

If you usually get number nine hose, better get nine's and a half from now on. The difference in size will not be noticed but the difference in darning will.

The heart of the home.

The heart of the home is the kitchen, and the enjoyment of the home life largely depends on the good things to eat that come out of the kitchen.

To own a Majestic is the ambition of every housewife who realizes what this supreme quality range would mean to her in better baking and lighter work.

To have a *Majestic Range in her kitchen* is the hope of every woman who knows how *beautiful* it is in design and appearance, and how sanitary it is in finish.

Majestic means economy in the kitchen, as well as better baking and less work. Food is saved, because the Majestic's perfectly built oven always bakes right. Fuel is saved, because the cold-riveted construction is absolutely heat-tight—*permanently* so. Repairs are saved, because the Majestic frame of malleable iron is unbreakable, and its body of charcoal iron by actual test resists rust 300% greater than steel.

The Majestic is made in only one quality—the best—but there are many styles and sizes. The price is standard, the same everywhere, freight considered.

The price of a Majestic is less in proportion to crop values than it was even a few years ago. See the Majestic soon. There is a Majestic dealer in every county of 42 States. If you don't know of one near you, write us. *Send for free illustrated booklet today.*

The Range with a Reputation

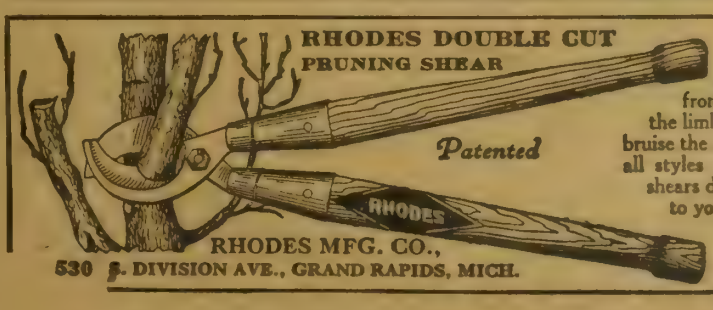
Grow Wheat in Western Canada
One Crop Often Pays for the Land

Western Canada offers the greatest advantages to home seekers. Large profits are assured. You can buy on easy payment terms,

Fertile Land at $15 to $30 per Acre—

land similar to that which through many years has averaged from 20 to 45 bushels of wheat to the acre. Hundreds of cases are on record where in Western Canada a single crop has paid the cost of land and production. The Governments of the Dominion and Provinces of Manitoba, Saskatchewan and Alberta want the farmer to prosper, and extend every possible encouragement and help to

Grain Growing and Stock Raising.



Though Western Canada offers land at such low figures, the high prices of grain, cattle, sheep and hogs will remain.

Loans for the purchase of stock may be had at low interest; there are good shipping facilities; best of markets; free schools; churches; splendid climate; low taxation (none on improvements).

For particulars as to location of lands for sale, maps, illustrated literature, reduced railway rates, etc., apply to Supt. of Immigration, Ottawa, Can., or

Sow Morse's Seeds

It is the right start for a vegetable garden that will produce to your satisfaction—a garden that in proper season will

Keep Your Table Loaded With Good Things To Eat

carrots, beans, peas, radishes, cucumbers, celery, corn, tomatoes, squash, melons

and other vegetables from your own garden will keep down the cost of living.

Plant a garden this year but be sure you use MORSE'S SEEDS—specially selected, re-cleaned, soil-tested, always true to name, and dependable.

Morse's vegetable and flower seeds in baskets are sold by dealers everywhere. For prices on quantity lots of any kind of seed write to the largest seed growers in the West,

MORSE'S SEED

100,000 SEED BED STOCK
50,000
Washington Navels, Valencia Late Oranges, Eureka and Lisbon Lemon and Marsh Seedless Grapefruit Trees

from carefully selected trees as to quality and production. The main consideration in buying citrus trees is to have them not only true to name, but true to the strain and type from which they are budded. The few cents more that you pay for our trees is money well spent and will be returned to you a thousandfold every year during the life of your grove.

POULTRY

Hens: heavy, 30@32; light, 30; colored, 32; broilers, 40@43; fryers, 35; roasters, 30; old cocks, 20.
Ducks, 30; ducklings, 32; geese, 28; turkeys, 34@35; squabs, 40-43; Belgian hares, 20.

LIVESTOCK

The outlook in the live stock situation as regards beef cattle is a puzzle to both producer and slaughterer. Producers are holding their good steers for a higher price than this market can stand to pay. The territorial limits of the outlet for the dressed product, keen competition from a large northern city to as far south as our suburban towns and the opportunity of this northern city to underbuy and under sell the Los Angeles killer due to the greater sources of supply and a better outlet have brought about this condition.

Live stock producers in Southern California who are keeping posted on the markets of Kansas City and Chicago are wondering why the Los Angeles market is not as strong or the prices as high as in those cities. The fact is this limited outlet for the dressed product, and when a certain price level is reached, local retailers are reluctant to pay more; hence the slaughterer is between two fires.

Prices paid for steers and cows are fully steady. Hogs are weak excepting for best grades. Lambs are steady. Mutton is weak.

Following are the live stock prices Tuesday in Los Angeles, f. o. b. packers' yards. Prices at country points are $1.00 to $1.50 per hundredweight less than those quoted:

Good steers, 13.50@14.50; Med. steers, 11.00@12.00; Common steers, 9.00@10.00; Good cows, 10.50@11.50; Med. cows, 8.50@9.50; Common cows, 6.50@7.50; Hogs No. 1, 175-225 pounds, 16.00@16.50; Hogs No. 2, 250-400 pounds, 15.00@15.25; Lambs No. 1, 16.00@16.50; Wethers No. 1, 11.00@12.00; Ewes, 8.50@10.50.

POTATOES

Wholesale selling prices:

Supplies heavy. Demand and movement draggy. Stockton, Burbanks, quality and condition good. Sacked per 100 pounds, fancy 2.35@2.40; choice 2.00@2.15; Idaho Russets, quality and condition fair 1.85@1.90; Oregon, seed stock, White Rose and Red Rose, sacked per 100 pounds 2.75@3.00. Homegrowns, White Rose, mostly 2.75@3.00; few fancy, 3.25. Sweets, best, lug, 90@1.00.

ONIONS

Wholesale selling price, cwt.

Demand and movement moderate, little change in prices. Stockton, sacked per 100 pounds: Browns, best 2.25; White Globes, 3.00@9.00; Lompocs, Browns, 2.25.

SEEDS

Flax .....8@8½
Millet .....5@5½
Rape .....2½@5

HAY

Under date of February 8, Scott, Magner & Miller says:

Receipts the past week 929 tons. Most of the hay arriving has been of very good quality and although it has been difficult to effect sales, yet some have been made at our quotations, but as a rule the market lags and concessions have had to be made to move consignments. The showers of the past few days have been beneficial to growing crops but have affected the northern part of the state mostly, very little having fallen in the San Joaquin Valley. The government was in the market during the week for quotations for about 1200 tons for their encampments but have not placed orders as yet. As the amount requested was small, considering the usual amounts asked for, the inquiry has not disturbed the market.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market — for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay (light 5-wire bale) .....24.00@26.00
No. 1 Wheat or Wheat and Oat hay .....22.00@24.00
No. 2 Wheat or Wheat and Oat hay .....16.00@20.00
Choice Tame Oat Hay.....21.00@23.50
Other Tame Oat hay .....16.00@19.00
Wild Oat Hay .....16.00@18.00
Barley Hay .....16.00@18.00
Alfalfa .....16.00@19.00
Stock hay (in order) .....14.00@17.00
No. 1 Barley straw, bale.....50@80
Damaged hay (all kinds), according to condition.

Citrus Fruit Market

Los Angeles, Cal., Feb. 12. 1919.

The orange market is materially strengthening, possibly to a degree due to the labor troubles in the picking districts which has materially lessened the total shipment. Water separators have been installed in many packing houses and injured fruit has been excluded. Marmalade plants are working day and night. It is now estimated that the total of Valencias for late shipment will not exceed 13,000 cars.

The lemon market is in fair condition with prices ranging from $4.00-5.00, the top price being received for only very fine stock.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 5482 cars, lemons 1863, total 7345. To same date last season; oranges 3535, lemons 840, total 4375. Central California this season; oranges 2928, lemons 330, total 3258. Last season to same date; oranges 1881, lemons 102, total 1983. Northern California; oranges 244, 2 lemons. Last year same date, 202.

AT THE AUCTION

February 5

New York: 16 oranges, 4 lem. Nav. 3.25-4.85, tang. halves 2.85-3.10, lem. 4.25-4.90.

Boston: 5 oranges, 2 lem. Nav. 3.80-5.35, lem. 4.50-4.95.

St. Louis: 2 oranges, 1 lem. Nav. 3.30-3.85, lem. 2.60-4.35.

February 6

New York: 15 oranges, 3 lem. Nav. 3.65-4.75, Navelencias 3.70-4.80, tang. halves 2.40-3.80, Blood halves, 2.15, lem. 4.55-5.05.

Boston: 6 oranges, 1 lem. Nav. 3.60-4.60, lem. 4.60-4.95.

Pittsburg: 2 oranges, 1 lem. Nav. 3.50-4.30, lem. 4.10.

February 10

New York: 26 oranges, 9 lem. Higher. Nav. 3.50-5.10, lem. 4.05-4.95.

Cleveland: 6 oranges, 1 lem. Nav. 2.35-4.15, lem. 4.00.

Boston: 11 oranges, 2 lem. Nav. 3.35-4.70, lem. 4.10-5.10.

St. Louis: 7 oranges, 1 lem. Nav. 3.10-4.05, lem. 2.85-3.90.

Pittsburg: 8 oranges, 1 lem. Nav. 2.15-4.45, lem. 3.05-4.60.

February 11

New York: 31 oranges, 6 lem. Nav. 3.45-5.10, tang. 3.56-3.70, lem. 4.35-4.80.

Boston: 8 oranges, 1 lem. Nav. 3.80-4.55, lem. 4.55-5.00.

Philadelphia: 5 oranges, 1 lem. Nav. 2.00-4.25, tang. 3.55, lem. 2.80-3.95.

MARKET NOTES

California Iceberg lettuce is now going forward in large quantity and is commanding as high as $5.50 per crate at Eastern markets. Imperial Valley is now sending out well up toward 20 cars per day. In one day recently she sent 11 cars to Chicago, 1 to Denver, 1 to Kansas City, 1 to Oakland, 1 to Portland, 3 to San Francisco.

Car lot shipments of mixed vegetables from California last Monday included one carload to Argentine. Other shipments same day aggregated 24 cars to the following points: Chicago, Demming, El Paso, El Centro, Fort Worth, Kansas City, Oakland, Reno, Seattle, San Francisco, Tucson, etc.

California ships about 5 carloads cabbage daily to Chicago.

Imperial Valley has shipped practically all of its spinach. For local delivery some California growers are delivering in the old time round bushel baskets which are commanding about $1.00 per basket.

The increase in the transient or tourist population in Los Angeles through the winter season gives a market which is somewhat different from that of any other section of the country. Especially so in the matter of meats. The market is continually long on low priced cuts while it is hard to secure sufficient choice cuts.

Producers of lamb use care that the lambs do not take on too great weight for the retailers will not buy heavy lambs as lambs but put them in the mutton class or at least yearling, forcing them to a lower price.

Massachusetts uses almost half the wool supply of the United States. During 1918 she used 267,897,312 pounds while the United States used only 605,158,021.

STORRS EGG LAYING CONTEST

Storrs, Conn., January 31, 1919—Report for the thirteenth week, ending January 30.

During the thirteenth week of the laying contest at Storrs, a pen of Rhode Island Whites, belonging to Harvey A. Drew, New Jersey, won first place among the 100 pens by laying 44 eggs. Two pens of White Leghorns belonging to S. G. McLean, Connecticut, and C. Rasmussen, New Jersey, tied for second place by laying 41 eggs. Two pens of R. I. Reds belonging to Homer P. Deming, Connecticut, and Natick Farm, Rhode Island, tied for third place by laying 40 eggs. The Connecticut pen of Leghorns belonging to S. G. McLean has been doing particularly creditable work during the past few weeks. In a relatively short time they have advanced from fourth place to first place among the White Leghorns.

The total production for all pens amounted to 2268 eggs, or 32.4 per cent. The total figure is 266 eggs greater than for the preceding week. It is exceedingly interesting to note that of this increase 242 eggs, or 91 per cent, were laid by White Leghorns. In other words, the Leghorns have begun a rapid climb in egg production, which may be expected to continue, barring unseasonable weather, for many weeks to come.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Jules F. Francis, 369; Samuel M. Monks, 338; Rock Rose Farm, 303.

White Wyandottes

Obed G. Knight, 457; Laurel Hill Farm, 395; Patrick F. Sullivan, 366.

Rhode Island Reds

Laurel Hill Farm, 377; Deer Brook Poultry Farm, 306; Natick Farm, 284.

White Leghorns

S. G. McLean, 380; D. Tancred, 370; L. E. Ingoldsby, 313.

Miscellaneous

H. A. Wilson (White Rocks) 221; Harvey A. Drew (R. I. Whites) 189; S. Bradford Allyn (White Rocks), 164.

REVERSING IT

A New England man was visiting a friend who owns a ranch in one of the arid regions of the West. As the guest was shown over the place, the owner recited the difficulties and obstacles he had overcome in making the desert bloom, and he also touched upon his plans for the future.

"You astonish me, Tom," said the New Englander. "Is it possible to make a living on such land as this, and in such a climate?"

"It surely is. I have made a great deal more out of it than a mere living."

"I am glad to hear that, for you must have laid by something for a rainy day."

"Better than that," said the owner. "With the help of an occasional rainy day I have managed to lay by something for the dry days."

BREAKING THE NEWS

The boss called his typist to his room.

"Miss Keytap, you are a very pretty young woman."

"Oh!" said Miss Keytap, blushing.

"You dress neatly and you have a well-modulated voice. I might add that your deportment is also above reproach."

"I only want to put in a cheerful frame of mind," said the boss, "before taking up the matter of your spelling and punctuation."

Garden Grove hopes to secure the operation of a large dehydrating plant for its vegetables during the coming season.

Olive Trees

such as these are grown only on our foot-hill locations. Note the good roots—for hardiness they have no equal.

We have a fine lot of Mission and Manzanillo trees, both on Picholine roots and grown from cuttings. We have had splendid success on all Olive plantings—a most important assurance to you.

Submit a list of your tree wants for special quotation. Do it right now.

We have also a complete assortment of Shipping Plums, Cherries, Prunes, Bartlett Pears, Fall Pears, Peaches, Almonds, Apricots, Walnuts, etc.

Our foot-hill grown trees are free from root diseases common to other localities. Our trees insure your future profits in fruit growing.

And remember—we will accept Liberty Bonds as full or part payment for trees. Write us today.

An Incubation Catechism

Written for California Cultivator By Jean A. Koethen

HINTS on Hatching for Amateurs and Beginners.

1. What is the best time for hatching?

February and March are the best months in California. Some hatcheries begin getting chicks out in January, but in most the first hatches come off about the first of February.

2. What is the best hatcher, hen or incubator?

That depends entirely upon what you want and who you are. If you are mechanically inclined and want several hundred chicks, or if you want early chicks and have no sitters, use an incubator. If you don't like tinkering with a machine, or don't want very many chicks, or haven't much time, trust the old hen.

3. Is there any difference in the hatching efficiency of different hens?

Heaps of difference. Avoid hatching with pullets, if possible. They are skittish, hard to break to the nest, and flighty mothers. Not always, but often. Some old hens are too energetic to be good mothers. They may be good sitters but are too anxious to scratch to hover their brood properly. Select a quiet hen. If you can set two at once let the quieter one mother all the chicks while the other hatches another clutch of eggs.

4. How many times in a season may a hen be allowed to sit?

Not more than twice, as a rule. She may hatch a brood early in spring, and another late, if she goes broody again, or she may hatch two clutches of eggs in succession if she is given good care.

5. How soon after they are laid should eggs be set?

The sooner the better. Every day they are kept lessens their hatchability slightly. Don't keep them over a week if you can help it, and do not hold longer than ten days under any circumstances.

6. At what temperature should hatching eggs be kept?

From 50 to 60 degrees is best. If they are much warmer than this incubation may be started; if much colder there is a chance of chilling the germ.

Hatching and Brooding Coop
From Mrs. Koethen's "Poultry for Profit."

7. Why is it important that a hen be dusted well before she is set?

If there are lice on her, she becomes restless and may leave the nest too often or even quit her job altogether. If she is lousy when the chicks hatch, they are almost certain to suffer.

8. What is the best way to break a sitter to her new nest?

Leave her on the nest she has been accustomed to for two days after she goes broody. Then remove her at night to the new nest, put the eggs under her, and cover her up for two days more. Once a hen gets used to feeling a nestfull of warm eggs under her breast, she does not willingly leave them.

9. What is the best feed for a sitter?

Whole corn. If this is not available, cracked corn, milo or kafir or wheat, will answer, but she needs the feed that will best maintain her bodily heat, and this is whole corn.

10. How often should she be allowed or required to leave the nest?

Once a day, preferably towards noon, when the sun is warm. If a hen does not get off herself, it is best to take her off, and see that she eats and then returns to her nest. If she is inclined to get off more than once a day, except in very hot weather, there is something wrong. Either she is annoyed by vermin or she is too restless to be a good sitter and should be replaced by a better one.

11. What is the period of incubation for various kinds of eggs?

Hens, 21 days; ducks and turkeys, 28; geese, 30; Muscovy ducks, 33 to 35 days.

12. What is the object of testing eggs that have commenced to incubate?

There are three reasons for this: (1) To save infertiles while they are still fit for food. (2) To give the fertile eggs more room. (3) To find out, if the eggs have been purchased, how many are infertile. Responsible breeders replace infertile eggs if they are returned.

13. When should eggs be tested?

Generally speaking, on the seventh day and again on the fourteenth day. The beginner will often find it better, especially if the eggs have dark shells, to defer the first testing till the eighth or ninth day, when the live germ is more readily distinguished than on the seventh.

14. Why should there be two testings?

The first testing removes the clear or infertile eggs, but sometimes there are doubtful eggs, which must be left for the later testing. The second testing is intended especially to remove germs which have died after the first testing. If these are left in the nest they rot and poison the air, which should be as fresh as possible for the hatching chicks.

15. How are eggs tested?

An egg tester should be procured. It may be bought for a trifle at any poultry supply store, and is part of the equipment of every incubator. Testing is best done at night. We use an electric globe on the end of a cord. The globe is inserted in the tester, and each egg held before the side opening. If a globe is not available, a small lamp will answer.

16. How are live germs, infertile eggs and dead germs detected?

By the seventh day a live germ looks more like a large spider than anything else. An infertile egg is perfectly clear. A dead germ is usually marked by a red ring, called a blood ring. If an egg looks cloudy, though the germ cannot be plainly seen, it is better to return it to the nest. The germ may be merely slow in developing.

17. At what temperature does a sitting hen keep the eggs?

The temperature of the hen's body is around 106 degrees, but the eggs she covers are not kept at this heat. Those next her breast are considerably warmer than those at the outer edge of the nest. This is the reason a hen moves the eggs so frequently with her beak. Probably the average heat of the eggs is around 103 degrees, though it must often be less when a hen has to cover 15 eggs.

18. At what temperature should an incubator be run?

The first week the temperature should stand at 102 degrees, the second and third weeks at 103 degrees. A little rise in temperature is permitted at hatching time, but if it goes

Dependability Makes Horseless Farming Possible

Splendid evidence of the "Caterpillar" Tractor's dependability is offered by the fact that so many ranchers place entire reliance upon this tractor for ALL their power needs. Doing away with horses completely, placing entire reliance upon the tractor, is possible only when that tractor can be depended upon to give the same steady service, day after day, month after month.

The "Caterpillar" Tractor not only possesses the dependability that makes unnecessary the keeping of horses for emergency use, but it also possesses the all-around usefulness—the versatility—that adapts it to a wide variety of work.

This dependability and versatility have been achieved by correct design, proper choice of materials and highest grade workmanship. Let us tell you more about the "Caterpillar" Tractor and what it can do to reduce your costs and increase your profits. Send for Folder No. 393.

"Caterpillar" 75 and 45 Tractors for Immediate Delivery

"I HAVEN'T an animal on the place," said F. B. Nims of Stockton, recently, in telling a visitor how he handles his work on his ranch in the Sacramento Valley.

"I used to have forty horses and all kinds of trouble keeping drivers for them. Finally I decided to try gas engine power. I bought a 75-horsepower 'Caterpillar' Tractor, a motor cultivator and a 3-ton motor truck, and now my troubles are over. I never want to see a horse again."

The F. B. Nims ranch is irrigated, protected from inundation by dykes. Beans and barley are grown alternately on 500-acre tracts. In the early spring, water is let on to the land from the river until it is entirely covered. Immense gas engine-driven pumps then pump it out until the level has been reduced to a foot or so below the surface of the soil.

In a few days the surface has dried sufficiently for plowing and the big "Caterpillar" 75 Tractor goes to work and keeps at it twenty-two hours a day until the plowing is all done. Then it pulls the seeders for the barley, while the beans are planted by the motor cultivator. Water again is let into the proper level. After the beans are up they are cultivated with the motor cultivator.

At harvest time the tractor pulls a 26-foot cut harvester and bean harvester. The harvesters thresh and sack at the same time and drop the sacks in bunches of ten. These are picked up by the motor trucks and carried to market. The whole cycle of operations is performed by gasoline power.

over 104 some of the chicks may be cripples.

19. What is the best method of hatching with incubators?

The one given in your instruction book. Follow it absolutely. The manufacturer of your machine knows better than anyone else what his machine will do. After you have acquired considerable experience, you may depart from the printed directions, but be very slow in leaving them.

20. When should eggs begin to pip?

If the eggs contain vigorous germs, and temperature has been even and sufficiently high, some chicks will pip the shell on the 19th day. By the 20th day hatching should be at its height. By the morning of the 21st day, every chick that is strong enough to live should be out of the shell. If the temperature has been too low, or the chicks are Asiatics, pipping may not begin until the 21st day, and still there will be a good hatch. Mediterraneans pip the shell a little earlier than the American breeds, and Asiatics are slower still.

21. Why do chicks die in the shell?

Nobody knows exactly. There are many contributing causes which may be responsible. More often than not, lack of vigor in the breeding stock and consequently in the germ, is the chief cause. Sometimes, when incubators are used, lack of moisture is blamed. A sudden drop in temperature might have such a result.

22. If a hen leaves her nest and stays off over night, will the eggs hatch?

They may. If the germ is vigorous and the eggs have incubated two weeks or longer, it is not easy to kill the chick. The earlier in incubation chilling takes place, the greater likelihood is there of loss. If chilling occurs before the 14th day, testing will usually show how much harm has been done. If after the 14th day, put under another hen and give them a chance.

23. Should chicks be helped out of the shell?

Not until they have been given every chance to get out without help. At the best hatcheries no chick is helped. If it is not strong enough to get itself out, it is considered worthless. Sometimes, when the eggs are under a hen, and the weather is warm, it is worth while to partly remove the dried membrane and give the chick a chance for its life. I have seen such chicks live and thrive.

24. Where is the best place to run an incubator?

No place is quite so good as a cellar. The best hatcheries are built partly underground, so that the temperature may be practically even.

25. Why is ventilation vitally important to a good hatch?

Because, during the process of incubation the egg gives off carbon dioxide and takes up oxygen. In order to carry off the carbon dioxide good circulation of air is necessary. When eggs are hatched under a hen she frequently exposes them to the air, and a good deal comes through her feathers at all times. For all that, it is necessary for the welfare of the growing chicks within their shells, as well as for her own, that she leave the nest for a little time each day.

Circular 99 of the college of agriculture at Berkeley gives explicit directions for hatching both with hens and incubators. Send for it.

INCUBATION—AND INCUBATORS

One man says there is practically no difference in incubators—but there is. There is just the same difference in incubators that there is in pianos, in automobiles, in tractors, or in any number of things that could be mentioned. True, incubators are all made for the same purpose—to hatch chicks—and they do it when the attendant does his or her part of the work, but people have notions about the things they buy. Even if the inside parts of all incubators were alike, and only the outside of the machines different, one person would buy one because it was painted red and another person would buy another because it was painted yellow. Then, some people want to pay a high price while others want to pay a low price for what they buy. There are so many people to be served that there must be a variety of things, incubators included, in order for everyone to be satisfied. In buying an incubator, the thing to do is to select the one that suits your notion and your pocket book, and then get it. The incubator catalogs, aside from containing descriptions of the machines, give a lot of good poultry information. Do not delay sending for the catalogs because baby chick time will soon be here again.

Multiplexing the Telephone

Marvel has followed marvel since Alexander Graham Bell invented his first simple telephone, the forerunner of the millions in use today.

In these last four decades thousands of Bell engineers have developed a system of telephonic communication, so highly perfected that the same crude instrument which at the beginning could hardly carry speech from one room to another can now actually be heard across the continent. This is because of the many inventions and discoveries which have been applied to intervening switchboard, circuits and other transmitting mechanism.

The vision of the engineers has foreseen requirements for increased communication, and step by step the structure of the art has been advanced—each advance utilizing all previous accomplishments.

No one step in advance, since the original invention, is of greater importance, perhaps, than that which has provided the multiplex system, by which five telephone conversations are carried on today simultaneously over one toll line circuit, or by which forty telegraphic messages can be sent over the one pair of wires. As in a composite photograph the pictures are combined, so the several voice waves mingle on the circuit to be again separated for their various destinations.

By this wonderful development the Bell System obtains for the public a multiplied usefulness from its long distance plant and can more speedily and completely meet the needs of a nation of telephone users.

Husband and Wife Sign Deed

When brothers and sisters inherit real estate in California does the law require the signatures of their respective husbands and wives to a deed in case of the sale of the property in order to give clear title?—Subscriber, February.

The law of the state specifically states that such signature is not necessary in the respect to the conveyance of the separate property, such as the above is, but private title companies, out of an excess of care do usually require such signature before they will issue a clear certificate.

Community Property

What is community property? Can the husband dispose of real estate without the wife's signature or knowledge? Can a wife have individual property if she earns it herself?—Subscriber, Orcutt.

Community property is all property acquired after marriage by either husband or wife, or both, including real property situated in this state and personal property wherever situated, acquired while domiciled elsewhere which would not have been the separate property of either if acquired while domiciled in this state; there is the exception that property acquired after marriage by either spouse through gift, devise, bequest or descent with the rents, issues and profits thereof is the separate property of the spouse so acquiring it. There is one other exception in that the earnings and accumulations of the wife and her minor children living with her, while she is living separate from her husband, are her separate property. The husband has the control of the community property, but under a late statute the wife must join with him in executing any instrument whereby such community real property is sold, conveyed or encumbered; there is a saving provision in this statute, however, providing that in case of such sale or encumbrance without the wife's signature to a party ignorant of the existence of the marriage relation any action to set aside the instrument on the part of the wife is barred after one year from the date of recording the instrument.

Fence Troubles

Two neighbors having respectively hogs and chickens and calves quarrel as to the building of a fence between them, particularly as to when each shall start and whether hog wire shall be put on or not. So neither starts to build and the animals respectively roam and cause destruction. What can be done?—Subscriber, Dorris.

The Civil Code requires that adjoining owners are mutually bound to maintain the fences between them, unless one chooses to let his land lie without fencing, in which case, if he afterwards encloses he must refund to the other a just proportion of the value, at that time, of any division fence made by the latter. Under that law the one who desires the hog tight fence is entitled to go ahead and fence the division line, when the other fences his property the former can recover from the latter one-half the value of the fence at that time. In the meantime the "estray act" is available for the service of each neighbor, that is either of them finding an estray domestic animal of the other upon his premises has a lien thereon for his expenses and costs as keeping him, as heretofore in these columns explained at length.

Avoiding Probate

Husband and wife own real estate. How can it be arranged so that upon the death of either the property will go to the other without probate proceedings? There are no heirs to receive any share. — Subscriber, Thermal.

The simplest, best and least expensive method is to file a joint declaration of homestead upon the property; then by law upon the death of either the real property descends to the other. There is the method of joint tenant deed under which the property must be deeded to a third party, who then deeds it back as joint tenants with right of survivorship. In either method, upon the death of one of the spouses, a proceeding to determine the fact of death of record is necessary to complete the chain of title; this is, however, generally less expensive than the probate proceedings.

Fence Laws

Are the fence laws the same in all the counties of California? Must one fence his place to keep stock off?—Subscriber, Newhall.

Answering the first question as it is put, the fence laws are by no means the same in all of the counties; in fact they are in a sad state of confusion; many statutes relative to particular counties date as far back as 1850, although not carried forward into the recent publications of the laws, and consequently very difficult to ascertain with precision. Some of the particular laws have been expressly repealed, others have been expressly kept in force by a mere reference, others have been let alone, but subsequent statutes may or may not be held to have effected a repeal; others although not repealed, have doubtless, with change of customs and manner of living, fallen into disuse, but actually remain active, like a snag in a river. Generally speaking, however, one must fence in order to keep stock off, the remedy of the unfenced land owner being to take up the stock under the "estray act," but in that case he has no lien or action for damage caused but merely costs of keeping and sale.

Closing Gate on Public Road

Can A compel B to close a gate newly constructed upon a road that has been traveled by the public for more than 50 years although not a county road? A's place is not fenced excepting at the gate.—Subscriber, Newhall.

Taking the question as it is asked, the answer would be that A could not compel the closing of the gate. But, as frequently heretofore stated, these right of way of the public questions depend so much upon a detailed history of the facts relating to the original alleged acquisition of the right, the manner of its exercise, the attitude of the owners of the land in respect to it and many other particulars that an aswer for which one would wish to be held responsible cannot be given in these columns.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.
Unsigned communications receive no attention.

Scabby Pigs

Am writing to know what is wrong with my pigs. Have quite a number and they seem to get scabby, have stiff necks, hold their heads to one side and have sore eyes. They have very good appetite and when they start to the feed fall down and are just as apt to finish at the opposite

side of the pen. What it it? — Subscriber, El Centro.

There must be a mite that is causing the scabby skin and sore eyes. Scrub them all over with soap and warm water and then wet them with a ten per cent solution of some sheep dip that you can buy at almost any drug store. This better be repeated every few days for the next two or three weeks. Also clean up the pen and white wash it with lime. The fact of their stumbling and falling may be due to rheumatic conditions. Give them each a teaspoon of baking soda in the feed once a day for a week. Changing the feed and getting them into the sunshine may help also.

Poll Evil

Have a horse with the poll evil. What would you advise giving him to cleanse his blood?—Subscriber, San Fernando.

Poll evil is an abscess caused by a bruise and must be treated as such. One ounce of the tincture of iron mixed with the feed and given once a day for a week or ten days is a good blood tonic and may help in the healing.

Chorea (St. Vitus Dance)

I have a Percheron gelding six years old that has had peculiar symptoms for the last three weeks. His whole body seems to jerk at intervals of a minute, more or less. Lately it seems to center around his left leg or shoulder and will sometimes jerk his left foot from the ground. Otherwise he is perfectly healthy and will lead the whole bunch of horses in a half mile run just for fun, then as soon as he stands the jerking begins again.—Subscriber, Victorville.

Can not guess what it may be unless it is St. Vitus dance. That is caused by pressure on a nerve. This may be due to a partial dislocation of the spine and because it affects one shoulder the trouble must be just above or in front of the shoulder. A sudden jerk may put it back in place and he be all right again. May be you can help it by grasping the top of the withers with both hands and pulling it sideways or by twisting the head way around to one side or the other. Do not think that medicine would do any good.

Barrenness

Kindly advise what to do for cows that will not get with calf. They come in season regularly every three or four weeks. Have heard that there is a cure for the disease called abortion. Can you give us the remedy? — Subscriber, Atwater.

There are so many reasons for cows not getting with calf that it is hard to decide what is the reason in your case from so short a description. If they have been aborting then call in the nearest veterinarian and have them treated for contagious abortion. The trouble may be with the bull. If he is getting old change for a younger one. Give the cows exercise to warm them up just before breeding. The time of giving a dose of medicine for every ill is past. General conditions must be regulated also and nature must be assisted in every practical way. Cows that are fed high to force a large flow of milk and given little exercise are apt to be poor breeders.

Fails to Breed

I have a Jersey cow that is nice and fat and giving five gallons of milk daily. She was fresh October 15 and since that time has not shown signs to be bred. Please advise what to do. —Subscriber, Palms.

Cows that are nice and fat and get little exercise are apt to do just as yours is doing. Drive her several miles until she gets well warmed up. Repeat this once a week until she comes in heat and again just before breeding her. Also give her these powders; they may help some. Six ounces of powdered nux vomica, three ounces of the sulphate of iron and four ounces of good corn meal. Mix and divide into 20 powders and give one powder every day in a little feed. If she refuses to eat the feed with the medicine in it then put a powder in a bottle, add a cup of water, shake it up and give it as a drench.

Get Your *Irrigated* Farm From the Canadian Pacific

IN a climate not excelled by any agricultural area in America you can own a fine, rich farm of your own. The Canadian Pacific Railway offers you this opportunity to achieve independence and grow rich—in Western Canada. The lands offered are in the largest and most substantial irrigation undertaking in the Continent. The price is only $50 an acre—some for less.

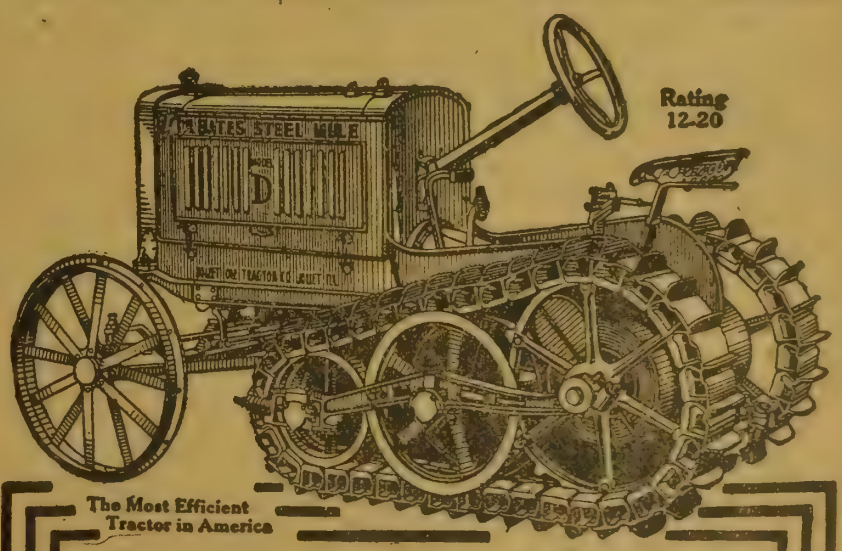
Twenty Years to Pay
You pay down 10% and have 20 years in which to pay the remainder. The first crop is often worth more than the total cost of the lands.

$2,000 Loaned to Farmer
Loans of $2,000 in improvements are made to approved settlers on irrigated farms with no security except the land itself. You can take 20 years to repay this loan at 6% interest.

Irrigation, Crop Insurance
This land is not arid but production can be greatly increased by irrigation. There is an unfailing supply of water which is administered under the direction of the Canadian Government. The provinces have no control over it and there is no conflict of law or authority over its use. The water is free, the only charge being a fee of from 50c to $1.25 per acre for the maintenance of the system and the delivery of the water. Irrigation here is *not* an experiment.

Why an *Irrigated* Farm?
Because irrigation in Southern Alberta
—insures crops every year
—increases crops every year
—makes you practically independent of weather conditions
—produces great quantities of coarse grains, pasture, alfalfa, roots, thus developing the live stock industry which is safer and ultimately more profitable than wheat farming
—tends toward close settlement, well cultivated farms, good neighbors, good roads, schools, churches, telephones, mail delivery, co-operative marketing, and a high standard of community life.

The Opportunity for You
The Canadian Pacific Railway knows that its prosperity depends on the prosperity of the settlers along its lines. Because it wants good settlers it is willing to sell its lands at these remarkable prices and terms.



Send for special railway rates and special booklet fully describing all lands and giving all details.

The Most Efficient Tractor in America

TURNS IN 7½ Ft. RADIUS

The Bates Steel Mule turns in less than its length—on soft ground or hard. The front wheels are supplemented by independent compensating brakes on either side of the differential gear. These allow the driver to slow down one crawler while the other travels around it.

The durably-built, long-life crawlers, that double the usefulness of the tractor, the dust-proof construction of working parts, the flexibility and the drawbar pull are also features you should know.

Come in any time and ask us about this greatest of all light tractors. You'll want one. They sell fast—so hurry, early.

THE ONLY CRAWLER TRACTOR ADAPTED TO BEET CULTIVATION WITHOUT MAKING CHANGES

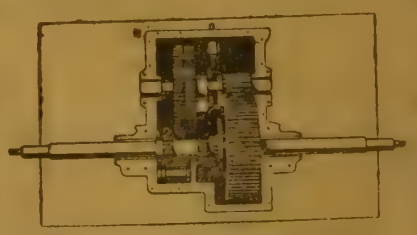
The Trundaar is rated at 20 horsepower on the drawbar and 35 horsepower on the belt



Every link and grouser plate is instantly detachable

The three-point suspension protects the engine against all shocks

The severest test of a tractor

ROUGH, uneven and hilly farms are the final and most severe test of a tractor. The tractor that pays in the long run is the one that makes good where the going is difficult. The Trundaar Tractor is making good on some of the most difficult farms of the West and Northwest because it has been designed particularly for that kind of farm land.

The massive Trundaar transmission requires no differential

The special Trundaar Tread supplies positive traction on the most difficult grades. This tread, built on the log-chain principle, is of the endless belt type. It requires no lubrication. If a link or grouser plate does get broken, it can be replaced in fifteen minutes by the removal of four bolts. The double three-point suspension allows this tread to give positive traction on the roughest ground. This suspension also protects the engine against the jars and shocks of rough work.

C. R. Coe & Son, Sawtelle, California, write:

"We know that our tractor is doing the work of fifteen horses and is not overloaded. We are working on side hills as steep as forty-five per-cent and pulling a six-ton Stockton gang plow."

An engine with excess power

The Special Buckeye Engine is designed particularly to stand the exacting work of heavy going. No ordinary internal combustion engine has to stand what the tractor engine does. It runs at full speed most of the time. It is bumped, shaken, subjected to clouds of dust, and run on low-grade fuel. The Special Buckeye Engine is designed expressly to meet these conditions. It is built big, powerful and strong to give continued, dependable service.

Special gear ratio

The massive Trundaar Transmission is built with a 5½" face on the main driving gear and is designed to have a 20% factor of safety. A special low gear ratio is furnished where the country is hilly, to give excess driving power for the grades.

A tractor that has the power and stamina to make good on rough going would be a profit-maker on your farm whether it is hilly or flat.

If you are farming 200 or more acres, write today for records of results and more complete information about the fourteen special mechanical features of the Trundaar.

Los Angeles — An Illustrated Weekly for the Rural Home and Ranch — San Francisco

Vol. LII — February 22, 1919 — No. 8

THE more I am acquainted with agricultural affairs the better I am pleased with them; insomuch, that I can no where find so great satisfaction as in those innocent and useful pursuits. In indulging these feelings I am led to reflect how much more delightful to an undebauched mind is the task of making improvements on the earth than all the vain glory which can be acquired from ravaging it, by the most uninterrupted career."—George Washington.

It has been maintained that Washington was the first scientific farmer of this country. He grew alfalfa in 1760; he was the first American to raise mules in this country; made his implements and much of machinery with his own hands and was a pioneer in improving breeds of stock. At his death he was the richest citizen of the Republic with 60,000 acres of farming land.

Overland

The New Friend

Overland cars have the reputation of making close friends. In fact, Overland cars are conspicuous everywhere there are up-to-date farms with modern equipment. What stronger recommendation could be asked for, than the fact that more than 115,000 owners vouch for the complete satisfaction of Overland Model 90 cars? The steadily growing public appreciation of Overland is evidenced in the demand of this season. See the Willys-Overland dealer now.

Pruning the Lemon

By Robert W. Hodgson

THE subject of pruning citrus trees, and particularly the lemon, is one upon which growers have but rarely been able to agree. For 20 years and more this subject has been argued and discussed at various meetings of fruit growers and a large number of so-called systems of pruning have been advocated and used for a time, only to be discarded or changed as experience has revealed their merits or demerits. Indeed, the fact that some growers who have not pruned at all have obtained fairly satisfactory crops has even raised the question in the minds of many citrus men as to whether citrus trees require pruning.

Nature's Way
Top of lemon tree allowed to grow to sucker, or non-bearing wood.

Why Prune Lemon Trees?

It is quite true that in California orange and lemon trees if left unpruned will bear fruit and will oftentimes bear large quantities of it. This quality, however, is nothing more than a gift of nature. Almost any fruit tree if left alone will bear in California. Many sorts will literally bear themselves to death if thinning of the fruits is not done. According to the most exhaustive investigations on the subect, the most important factors influencing the fruiting habit in trees are low atmospheric humidity, high summer temperatures, and intense solar radiation. These attributes are precisely those which characterize our long California growing season. Therefore it is at once obvious that we do not prune primarily for fruit in California. We prune for reasons of convenience in gathering our crops, for convenience in fumigating our trees, and for the development and maintenance of long lived trees. We hear a great deal these days about our trees going back and the necessity of renewing them and this necessity is largely ascribed to the old age of the trees. The writer ventures to make the assertion that properly pruned and cared for otherwise, we need not expect any deterioration in our citrus trees for many years yet. On the authority of Dr. H. J. Webber, dean of the citrus experiment station at Riverside, there are citrus trees in other citrus districts of the world hundreds of years old and more, and still bearing.

There are a number of reasons why lemon trees should be pruned. One is that on account of their vigorous growth habit the trees become too large and unwieldy if not pruned, which considerably increases the cost of picking the fruit and fumigating the trees. Another is that if unpruned, they become so dense as to exclude the light from the interior of the tree with the result that all the fruit is borne on the outer limbs where it is exposed to sunburn, wind inury and other adverse climatic conditions. It is quite possible by pruning the tree so as to encourage the production of inside fruit to carry more and better fruit on a small tree than on a large unpruned tree. The third and most important reason for pruning lemon trees is that if left alone many lemon trees grow up to a wood which is undesirable in that it fruits sparsely and deteriorates early.

Three Kinds of Growth
Mr. Englehart has his hands on sucker growth. Behind the netting is fruiting wood and "white wood", of much less vigorous growth. The three kinds of wood are budded on same tree.

Principles Underlying Pruning Lemon Trees

Polymorphism — Lemon trees, together with certain other tropical plants, possess the remarkable property called polymorphism; that is, they produce different kinds of growth on the same tree. This is inot a matter of bud sporting in the ordinary sense of the word. It is quite true that citrus trees are very prone to give rise to bud sports or mutations, but no two bud sports are alike, whereas there are several very distinct classes of growth regularly produced on lemon and orange trees.

A rational system of lemon pruning should be based on a knowledge of what kinds of growth one can expect in a lemon tree, what can be expected from these different kinds and a judicious selection to the most desirable sort. One of the first men to recognize the fact that lemon trees are polymorphic was J. P. Englehart of Glendora, who has pruned and lived with lemon trees for more than 25 years. Mr. Englehart, who comes from a famil of horticulturists and nurserymen, early recognized that there are different kinds of wood in lemon trees and the very satisfactory results which he has achieved as a pruner have largely been due to his keen powers of observation as to what kinds of wood are best.

Not Nature's Way
Same tree pruned back to desirable growth. Note mass of prunings on ground.

Kinds of Growth

For convenience we may divide the kinds of growth into three classes, on one extreme the true fruit wood, on the other the sucker wood, and in between an intermediate class. This latter class really contains several kinds of growth which are intermediate in nature between the fruit wood and sucker growth. Nearly every grower recognized fruit wood as that slow growing, pendant, small leaved, fine stemmed type of growth which fruits early and bears the best quality of fruit. Similarly, most growers know sucker growth as that vigorous, fast growing, upright, large leaved, coarse grained type of growth which bears fruit only on the end and sooner or later loses its fruiting habit. The intermediate class gives the most trouble. In this class Mr. Englehart recognizes two kinds, "white wood" and "wood growth," both of which are intermediate in nature, being more upright, vigorous and cross grained than the fruit wood.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Perhaps the title, "Father of His Country," was given to George Washington because of his services to his country in being a farmer and a good one. While he paid no income tax he kept accurate account of every farthing expended and every farthing received, and at all times was aware of the true situation from the business side of the farm. As to farming methods here is a sentence from a letter to a friend which sounds somewhat like modern day preachments:

"The aim of the farmers in this country (if they can be called farmers) is, not to make the most they can from the land, which is or has been cheap, but the most of labour, which is dear; the consequence of which has been, much ground has been scratched over and none cultivated or improved as it ought to have been: whereas a farmer in England, where land is dear, and labour cheap, finds it his interest to improve and cultivate highly, that he may reap large crops from a small quantity of ground."

DAIRIES TO EUROPE

The movement of American bred dairy cattle to Europe has begun. The first shipment was of 100 head of high bred Holsteins ordered by the French commission. The dairy division of the United States department of agriculture chose the animals. It is thought this shipment will be a forerunner of many.

It is time for cow testing associations to do more and better work than ever, for tested animals should have the advantage when individuals are being picked for this market.

KILL THEM OFF

This is a good time to dispose of the non-productive old hens. We realize that the beginning of the molting season is the usual time, but with prices of eggs on the toboggan and feeds refusing to slide to any material extent it does not pay to continue supporting hens of indifferent quality. A year ago there was a federal ruling prohibiting disposal of laying hens. That ruling does not obtain this year and the poultryman should satisfy himself as to the worth of every individual.

GRAFT NOW

The land owner who has California native black walnut trees and contemplates using them for quick production of nuts should cease his contemplation and get busy at once grafting. A few practical suggestions are given by Mr. Neff on fifth page of this issue. We have seen some wonderfully productive trees made over from these wild trees of chance planting. The next ten days should see the work of grafting completed.

LEAGUE OF NATIONS

The Pacific Coast is this week given the inspiration and honor of hearing ex-President Taft and many others of the nation's clearest thinkers in the discussion of the plans for a league of nations. Fortunately, however, before the holding of the Pacific Coast meetings the Peace Conference at Paris has almost brought into being such a league. At least it has proceeded so far as to draft the constitution or foundation of such a great organization of nations.

This league proposes to outlaw war and every nation subscribing to it agrees to submit its difficulties to an arbitration board. However, it does not propose to bring into being an organization so loose-jointed as to lack power to enforce its own mandates. If a contracting nation refuses to carry out an arbitration decision the executive council shall take steps to give it effect. All contracting parties agree to submit all disputes to the executive council, and the league takes to itself all supervision of trade in arms and ammunitions in every country in which such control is necessary in the common interest.

The San Francisco meeting is one of nine held the country over with the idea of supporting such a movement but, as now develops, the Peace Conference has already acted, and the effort in these meetings will now be to inform the American people of the provisions of this great document and the necessity for its approval by the congress of the United States.

GEORGE WASHINGTON THRIFTOGRAMS

The 187th anniversary of George Washington's birthday is being celebrated today. Washington, the successful builder of a nation, gave voice to rules for personal and national success which are as applicable in this 1919 year of necessary Thrift as in his day. Here are some of his words on the use of money and resources that might have been written for the present situation in America:

I am no more disposed to squander than to stint.

Economy makes happy homes and sound nations. Instill it deep.

It is not the lowest priced goods that are always the cheapest.

I cannot enjoin too strongly upon you a due observance of economy and frugality.

Keep an account book and enter therein every farthing of your receipts and expenditures.

Promote frugality and industry by example, encourage manufactures, and avoid dissipation.

Reason, too late perhaps, may convince you of the folly of misspending time.

There is no proverb in the whole catalogue of them more true than a penny saved is a penny got.

Nothing but harmony, honesty, industry, and frugality are necessary to make us a great and happy nation.

These statements by George Washington as to wise personal economy might be paraphrased today in the injunction of the National Thrift Campaign—spend wisely, save intelligently, avoid waste—and invest safely; buy War Savings Stamps and Thrift Stamps.

THE ORANGE SHOW

San Bernardino is having some beautiful weather this week and pulling off one big show. The ideal weather has resulted in liberal attendance, and as these words are written arrangements are being made for a citrus institute which will bring a representative attendance of citrus growers from all portions of the Southwest. The features are much as usual, but quality of the fruit is even better than anticipated, and it is remarked that the showing of fine fruit is proof of the slight damage from the season's cold. The show is to close next Sunday night.

WHEELER TO RETIRE

Because of having reached the age of retiring and, in addition, having served for an even score of years, President Benjamin Ide Wheeler of the University of California has tendered his resignation to take effect next July. In tendering his resignation he writes the regents: "I have honestly done my best. I am sure therefore that I shall not be esteemed to be quitting my task, if I ask you to give me your blessing, and let me go. This is my resignation of the presidency to take effect on the above-named date."

CLEANER FARMS

We recently saw the statement that the origin of practically all the typhoid of cities was in rural districts and introduced into the city through water supplies, milk supplies or the transporting of garden products. It is generally accepted as true that the sanitation of the largest cities is far superior to that of rural districts. This is so because it is necessary that greatest care be given where there are large aggregations of human beings, and while this care is not so essential in rural districts, vastly more attention should be given to sanitation there than ever has been. The first duty of the state is to make for healthful living conditions.

IMPORTING MEATS

This country imported over 100,000,000 pounds of meats during 1918. This came principally from Argentine and Canada. Of course there have been vast exports to Europe, but there is no reason why this country may may not produce all its own meats in addition to necessary exports.

GROW A CHRISTMAS TREE

With the forest service making more stringent regulation is the matter of removal of young trees for Christmas tree uses the question which presents itself is: "Why not grow our own Christmas trees and save this annual denuding of the mountain sides?" Besides, Oregon has seemed to secure almost a monopoly of the Christmas tree trade. Let Californians get busy and plant some of their less productive land to firs which will make our own Christmas trees.

ANALYZE FEEDS

The department of agriculture makes examination of many shipments of cottonseed meal and reports that a proportion of these shipments have been found to be deficient in protein. While this deficiency is only slight it means a loss of $100 per car. These feeds should not be accepted unless properly tagged with a guarantee of correctness of report on the tag.

FARM BUREAUS

The Smith-Lever act which provided for the extension of the work of the department of agriculture through cooperation with the state universities and various county governments started machinery which proved a wonderful blessing to agriculture in this country under the stress of war. The act had provided for the initial expenditure of some five million of dollars or more, which sum was to be increased for a period of five years until it reached a total of about nine millions annually. This was to be supplemented by state and county support. The demands of war made necessary more complete organization and greater expenditure of funds, and as a special war measure congress made appropriations totaling, with the regular fund, nearly 17 millions for this work during the past 12 months.

This excess appropriation will end on the first of July, necessitating a material reduction in the activities of the farm bureaus. Congress is considering increasing the appropriation, and we believe should consider it most favorably, though there are some who feel that these particular activities have not resulted in every case in wise expenditure of the funds. To accomplish great results with least money it will be necessary to have a slower growth than was the forced war growth of this movement during the past few years. But notwithstanding mistakes, its value to the country has been very great.

PLANT A TREE

It has been suggested that everybody may well plant a tree as a memorial to the boys who have made the great sacrifice. No finer suggestion could be made. In California let it be a sequoia, a eucalyptus or some large growing tree. In any case, plant a tree. Those of us who have been here a score or more of years can appreciate the magnificent memorial which a tiny seed grows into in that time.

The estimated value of the crops in Arizona last year as reported by the federal reserve bank at San Francisco was $42,267,000 as against $31,193,000 in 1917. Total value of all minerals produced in the state for 1918 was $204,500,000.

Methods of Grafting Walnut Trees

By J. B. Neff

THE grafting of walnut trees which have proven unprofitable either because of light production or an undesirable quality of walnuts can be done successfully if sufficient care is taken in the placing of scions and the necessary attention given afterwards to the young growth.

Scions can be made to grow on stubs of any size but the best results are obtained where those stubs which are three inches or less in diameter are grafted. These will completely heal over in a few years while the larger stubs will have too much uncovered wood, and if special care is not given for a long series of years there is much danger of losing the tree from decay of the heart wood. The working over of old trees can be accomplished by going out farther on the branches to make the cuts and inserting more scions.

Native black walnut trees can sometimes be worked over and production secured from otherwise worthless trees and unproductive land. These native trees are often in the form of a clump of bushes coming from a single root system. In this case two or more of the best can be grafted and a further selection made by taking out all but the best after a year's growth is made. If there is no suitable growth in which to place the scions it will be well to cut off the old wood close to the ground and wait a year until new and vigorous wood is grown in which to place scions.

In selecting this new wood always take that which starts well down on the roots so that it may be able to form its own independent trunk and then take away all the old trunk that can be removed without injury to the new tree. Do not undertake to grow too many trees on an acre.

These old trees are likely growing under adverse conditions, so give the new tree a chance by having nothing closer than 60 feet.

Scions of any convenient diameter can be used but those that are from one-quarter to one-half inch in diameter are the easiest to handle.

The requirement in scions is that they shall be of mature wood, fairly straight, small pith, with two good buds, not shorter than three inches nor longer than six inches. These may be cut at any time after the leaves fall and until the bark begins to slip in the spring. They can be kept 60 days in damp, but not wet, sawdust in a cool place, or can be used the same day they are cut. The success of walnut grafting depends on a few rules which must be scrupulously observed. The white wood of the scion must make an airtight joint the full length of the tongue or wedge that is inserted in the stock. The cambium layer—the line showing between the bark and the wood—on the scion must correspond with the cambium of the stock as far as possible or at least they must cross each other several times, and all the cuts must be covered with wax so as to be airtight.

If the stubs are two or more inches in diameter it will not be necessary to tie the scion but if smaller, and on nursery stock, all should be tied tightly with stout soft twine. In preparing a tree for top grafting it is best to mark the branches in which the scions are to be placed and cut off all others close to the body of the tree, but if the branches are heavy a first cut should be made two or more feet from the trunk so there will be no splitting down on the trunk. This care must also be observed when cutting to place scions.

When the cutting has been finished use a heavy butcher knife to make the clefts for the scions, placing it in such position that a chip about one-half inch thick would be split from the stub, but instead of splitting a full width chip hold the knife so as to split from one side only and with a mallet drive the knife down about two inches. Then use a smooth steel wedge to open the cleft on the deep side and with a sharp knife make the cleft smooth. Cut the scion to fit, put it in place, remove the wedge and cover all the cuts with hot wax applied with a brush at once. Care should be taken to have the hot wax fill the cleft.

The same principles apply in grafting nursery stock, but since the stocks are smaller a tongue graft is most commonly used. The soil is removed from the nursery row until the roots begin to show. The stocks are cut off with a sharp saw about two inches above the roots, or wherever may be high enough to allow the tongue to be made in hard wood. The scion is placed and tied with strong soft twine. All cuts are waxed at once with hot wax. The soil is then moved back to the nursery row and heaped so as to cover the scions. Frequent examinations should be made of the grafting above ground to see that the wax does not crack and expose the cuts. When twine is used above ground it must be loosened after the growth begins but not removed until the scion has firmly united with the stock. After the scions have made a foot or more growth they will need supports to train them in the proper direction.

If there is an excessive flow of sap in old trees it can be controlled by boring small holes in the trunk near the ground, as explained in the Cultivator of February 8, page 172. Any wax that will retain its pliability in cool weather and not run too readily in warm weather can be used provided it does not have any free oils in it, as any oil which will not combine with the other materials will penetrate and destroy the cambium and the work will be in vain.

Grafting Wax

Five pounds resin, one pound wax, one-half teacup raw flaxseed oil. Melt and use hot.

It Takes Nerve but It Pays

When the walnut begins to be crowded it gets lazy and refuses to bear as it should. Then the grower needs his nerve and a sharp mattock. Overcrowded orchards never pay. Take out alternate trees then plant the next orchard 60 feet apart.

Made Over and More Profitable

Here is a walnut tree that did not come up to the standard. It showed blight more than it should; it failed to produce highest grade nuts; it was not allowed to board or to live off the products of the other trees. The four arrows marked "A" indicate where it was grafted. The tree is now producing far more and far better fruit. Arrow "B" points to a former attack of melaxuma which was treated with Bordeaux paste and later with asphaltum. The tree is now perfectly healthy.

Irrigation Engineer Professor G. E. P. Smith of the University of Arizona estimates that 60 per cent of the water served to the farmers this past season from the Roosevelt reservoir had been in storage since 1915 and that without the reservoir not more than one-half of the 205,000 acres irrigated could have been supplied with water, and the yield of crops on even this limited area would have been far less than it was. Reasoning from this analogy, it would not be far fetched to say that the crops produced this season as made possible by the reservoir would considerably more than pay for the entire project.

A large acreage near Dixon, Solano County, is now being planted to rice.

Agricultural News Notes of the Pacific Coast

Northern California

The state tractor school opens at Chico, Butte County, March 17.

One Glenn County sheep grower claims a loss of $700 from dogs.

State tractor school is now being conducted in Gridley, Butte County.

The state motor vehicle department has 374,721 automobiles registered.

The leading cow in the Sacramento cow test made her record on a feed of carrots.

The Hayward Pigeon Club, Alameda County, is planning for a show sometime in June or July.

Machinery is now on the ground for the erection of a cotton gin at Durham in Butte County.

A state highway will connect Suisun and Rio Vista. It will be 24 miles long and cost approximately $350,000.

An irrigation project for Dixon, Solano County, is again being agitated. It is proposed to use the waste waters of Putah Creek.

The city marshal of Woodland refuses to enforce the flu mask law, or rather declares he is too busy with his other duties.

Tehama County farm bureau meetings: Richfield, February 17; Corning, 19; Bend, 21; Los Molinos, 24. Special demonstrations have been made this week.

Napa County is talking up the project of building a concrete highway from Napa to Calistoga, later to be connected with the Sonoma County highway at Healdsburg.

The California Tractor and Implement Association is planning for a big tractor meet and demonstration at Sacramento May 5-10. President Gardner says he expects an attendance of 100,000.

The convention of the California Cattlemen's Association, originally scheduled for February 9-16, has been postponed until some time in April on account of cancelling of dates of the live stock show. Delegates from 49 counties will attend the convention.

Grain farmers who expect to market their grain in sacks next season are being urged by the farm agents to order for their requirements now as the control of the war industries board over jute products will end by May 1 and it is feared prices will be advanced.

The next meeting of the California Cattlemen's Association will be held some time in April. This meeting was to be held at the time of the International Live Stock Show which is now postponed till fall. A report of the marketing committee will be made at this meeting.

General Manager Plummer of the Pacific International Live Stock Commission at Portland pays high tribute to Prof. Gordon H. True of the University of California, calling attention to the wonderful work he did when he was head of the live stock department of the University of Nevada.

A mass meeting of grape growers and wine makers of Sonoma County was held on Sunday, February 9, in Cloverdale. Effort will be made through Theodore Bell to carry the bone dry provision to the federal courts and allow the harvesting of the 1919 wine grape crop. Similar meetings were held at Santa Rosa, Healdsburg and other towns in the wine grape growing section.

Central California

Turlock is now receiving great quantities of cantaloupe seed.

More silos is the slogan in almost every dairy section of the valley.

Kern County proposes to have better distribution and conservation of irrigation water.

Fresno County is discussing county maintenance of parks in different sections of the county.

Tulare Cannery is now contracting for 1919 tomatoes. Price to be paid is not yet determined.

The University of California announces the distribution of tested wheat and barley seeds.

San Jose Grange Patrons of Husbandry recently held memorial services for Theodore Roosevelt.

Horticultural Commissioner Rutherford is warning Stanislaus County potato growers to plant better seed.

County Commissioner Howard of Kings County is giving specific instruction to fruit growers in spraying.

A writer in the Modesto Morning Herald is raising the question of the success of the Milk Producers' Association.

Prof. Whitten of the University of California has been giving pruning demonstrations to orchardists of Santa Clara Valley.

Grain growers of the valley who have not arranged for bulk handling of grain are urged to place orders at once for sacks.

Stanislaus County has 200 acres in spinach practically ready for shipment. The yield runs around 5000 pounds per acre.

Madera County's annual farm bureau meeting was held at Madera last week and the livest subject was that of better markets.

Tulare County board of trade is publishing a road book for that county which deals particularly with mountain resorts and roads leading into them.

Cotton growers of the San Joaquin Valley have generally settled on Pima as the most profitable variety of cotton for that section and the best adapted.

A whaler working out from Monterey recently captured a 62 footer which yielded 90 barrels of oil and two tons of fertilizer, all valued at over $7000.

A bill has been introduced into the state legislature providing for establishment of a state nursery for growing trees for ornamenting the highways. Why?

A proposition for road building has been announced by the board of supervisors of Madera County, a road running west from Chowchilla being the principal part of the plan.

Fresno is urging the immediate completion of the Kings River Canyon road. The scenery of that great canyon is declared to be practically as fine as that of the Yosemite Valley.

Pajaro Valley is making a record this year in the movement of apples. The final clean-up will come much earlier than usual. Less than 100 cars now remain in the packing houses.

Senator Brown is making an effort to secure the passage of an enactment which will permit of state markets open to all, producers and consumers. This is a continuation of his effort begun years ago.

Southern California

Brawley, Imperial County, sends out a dozen cars of lettuce daily.

Imperial Valley poultry show is being held in Brawley this week.

The National Orange Show is in full swing at San Bernardino this week.

Banning, Riverside County, is packing prunes at the rate of 12 tons daily.

Imperial Valley is now shipping its cotton by the way of Los Angeles harbor.

Covina Citrus Association has paid to its growers over half a million dollars.

The slogan of swine raisers of the Imperial Valley is "Eradicate hog cholera."

The course in tractor operation begins at Riverside next Monday. February 24.

The state highway commissioner has recently made inspection of the Brawley-Inyo highway.

Los Angeles County observed last Saturday as Los Angeles day at the National Orange Show.

Elsinore, Riverside County, is advertising itself as a producer of earliest and sweetest of oranges.

San Bernardino County has shipped more than four times the citrus fruit it had this date last year.

Food is coming down. Elsinore, Riverside County, has reduced its rate on water by 25 cents monthly.

Riverside County irrigationists are discussing greater water supplies and more perfect conservation of the supply already in hand.

Representatives of the department of agriculture are making investigation as to sugar beet production in Southern California.

A Corona factory for the handling of citrus by-products held its annual meeting yesterday and made a report which shows that it is a successful institution.

The citrus institute under the direction of Dr. Webber of the citrus experiment station, will convene at San Bernardino, Thursday morning, February 20.

A bean broker has begun suit against a Ventura County Lima bean grower for non-delivery of beans which the broker alleges had been contracted. The suit is to recover $30,000.

The farm center at Garden Grove has been taking up the matter of more profitable poultry culture. Addresses have been delivered by Prof. E. J. Hauser of the University of California.

Victor Valley in San Bernardino County plans general extension of irrigation work. This is one of the richest sections of California and should conserve every ounce of its water.

"True harbinger of spring is creamy bloom of almond tree" is used by the Riverside Press in its invitation to a "True Carnival of Spring" as its trees are coming in bloom in San Jacinto foothills and San Gorgonio Pass and other well kept orchard sections.

Citrus districts, especially those about Covina, have had experience with Bolshevik agitators during this season. A bunch of Russians, together with some I. W. W.'s, have picketed orchards, urged Mexican pickers to throw up their jobs, and it is asserted have made threats of burning packing houses.

The Coast and General

Parcel post packages may again be mailed to Belgium.

The Snohomish gas engine school will be held at Arlington April 5 to 12, inclusive.

Carl Vrooman, assistant secretary of agriculture, has resigned his office because of ill health.

The Walla Walla Gardeners' Association has decided to affiliate with the Northwestern Fruit Exchange.

A part of the new concrete highway between Phoenix and Tempe has been completed and is open to the public.

The administration now estimates that it will be necessary to appropriate $1,250,000,000 to the wheat grower.

Eighteen farmers of Cowlitz Prairie, Washington, have formed an association to purchase hay and alfalfa in Idaho.

The annual convention of the Farmers Union of Washington and northern Idaho was held last week at Spokane.

The new county engineer of Maricopa County, Arizona, is doing considerable work improving the dirt roads of the county.

Hawaiian pineapple canners packed during 1918 approximately 4,000,000 cases of pineapples. The largest previous pack was 2,618,768 cases in 1915.

In addition to carload lots of lettuce, Glendale producers are shipping a considerable quantity of both lettuce and spinach by express to the mining towns of Arizona.

Secretary McClure of the National Wool Growers' Association, recently returned to Salt Lake City from Washington, says growers may expect 40 to 50 cents for the spring wool crop.

Wool growers of Klamath County, Oregon, are organizing. The immediate occasion for the organization was to present opposition to proposed legislation restricting and regulating sheep grazing.

Within the past two years Apache and Navajo Counties of Arizona have changed from bean buying sections to bean producing and shipping sections, while the consumption has increased several times.

The new railroad from Holbrook, Arizona, on the main line of the Santa Fe running south to the pine forests, is nearly completed. Track laying has been finished within five miles of Cooley, the terminus of the road.

Six or seven bunches of mountain sheep which have been protected are now to be found among the rugged and isolated parts of northern Arizona. There are comparatively few of these animals now to be found in the United States.

February 7 was Arbor Day in the following counties of Arizona: Cochise, Gila, Graham, Greenlee, Maripoca, Pima, Pinal, Santa Cruz and Yuma. The fourth day of April will be Arbor Day in the northern counties —Apache, Coconino, Mohave and Yavapai.

Over five inches of rain fell in the mountains above the Roosevelt Dam, assuring a plentiful supply of water for the coming season and also helping materially the range conditions in that part of the country. In the northern part of the state there was a heavy snowfall.

Citrus Culture---Beginners' Hints

Written for California Cultivator By Ernest Braunton

IN OUR last article full directions were given for planting, but no mention was made as to time. The proper time to plant any evergreen tree is when it is ready to grow. Deciduous trees are planted while dormant but there is no period of complete dormancy in evergreens, and they should not be disturbed until ready for planting nor planted until ready to grow. As citrous trees are native to the tropics they will not grow while the soil is cold. The best period for general planting is the second quarter of the year, March, April and May. Some exceptions will later be noted. Trees planted when soil is cold will lie dormant until warmer weather. If the season be cold and wet and the dormancy therefore prolonged, the finer and more tender roots may decay and also decay set in at the cut ends of larger roots. The result is that such trees start more slowly and somewhat feebly, for they have first to make a new set of feeding roots. In light soils planting may be done earlier than in heavy soils.

In the hot interior sections and the great valleys spring comes more suddenly than in coastal regions; the summer commences earlier and the cloudless hot weather makes a shorter planting season or a more risky one. So that while one should wait until the soil is warmer, planting should not be longer delayed, and when commenced should be finished in the shortest time possible. In coastal sections where cooler summer weather prevails planting may continue all summer, although the aim should be to complete the work in June so that the young trees may have a long season in which to get that vigorous growth impossible to trees planted later. Trees planted in July and August cannot make as vigorous growth but will make enough to become firmly established and in good working order for the following spring's awakening. But more care and caution is required for late plantings. Trees must be protected from rapid drying, moved quickly and copiously irrigated immediately after planting.

Heading and Protection

Young trees should have a clear stem of about two feet from soil to lower branch and it is not a good tree where all branches start from the same level, as is the case with the ribs in an umbrella. This makes a weak tree, or weak "crotch," as the tree men call it. It is better to let them head out over a range of six inches or more up the stem. If trees are headed three or more feet when you receive them it is best to head them again by cutting off top at not more than 30 inches from the ground. A citrous tree should be sturdy and compact and at the end of the third year its lower branches should droop to the ground. High headed trees but lengthen the handle of the umbrella and make it farther out of reach and more unwieldy and in great danger in times of stormy weather. Such heads also expose the stem to more serious sunburn.

Thousands of acres are each year set out without protection of stems, but protection should be given for a number of reasons, all good ones. In some sections it is necessary to guard against injury by animals, but such cases are not common. Protection is given, primarily, to prevent sunburn, and is necessary in all sections. Aside from the manifest mechanical injury the sap flow is interfered with, growth retarded and the young tree stunted. Thousands of experiments have proven that stem protected trees make far better growth the first and second year and of course they do to a lesser extent in after years. After the second year the top should sufficiently shade the stem. Stem protectors also prevent the growth of "suckers," and sometimes prevent injury from careless cultivators or irrigators with machines, shovels or hoes. Some wrap with burlap in strips or other closely clinging material. Such do not afford the best protection, except to insects and other pests they harbor, and sometimes retard growth by being too tightly fastened. Close wrapping excludes light and air and makes a tender bark so that if it falls or is taken away the stem is quickly and seriously injured by the sun. The yucca protectors best protect from any and all dangers, allow a free circulation of air around the stem and are far more efficacious in preventing sucker growth than burlap, for buds will push their shoots out through burlap wraps unless thick and tight. Protection pays.

The Pruning Puzzle

How to prune the orange tree is a subject much discussed, but as to the lemon tree all are fairly well agreed. The natural growth of the lemon is to make strong upright shoots of considerable length, on the tips of which young lemons appear in goodly number. I can see such a tree in my garden as I write. Shoots scarcely an inch thick run up six or more feet, branch near the ends and on each shoot are little lemons no larger than a common garden bean. This growth must be cut down to less than a foot high. From these stubs many laterals will spring, each of which will bear fruits. The lemon tree should be pruned each year from the very first year after planting. The tree should be built up of short sturdy branches. All long branches should be cut back to make a symmetrical head of strength, yet this head must not be allowed to become dense, as sunlight and air are necessary to good fruit. Lemon trees must be kept low to reduce the cost of picking and throw the vigor into a smaller area, making a prolific crop of excellent fruits. Some growers establish an arbitrary height, to which all growth is reduced twice or more each year. This height in bearing trees may first be but six feet and as the tree grows it is allowed to gain a few inches each year until it finally reaches a height never greater than ten feet. Some growers keep pruners in the lemon orchards the year around and keep trees clean of all weakly or dead twigs, while thinning and reducing the height as well. No namby-pamby treatment of the lemon will suffice, the pruning must be vigorous—real surgical operations on all strong growths.

With the orange no real pruning is needed for the first five years. One may go over the trees and cut out dead and weakly twigs, but this is mere snipping, not pruning. There may be an occasional strong growth or water shoot to be headed back or entirely removed in order to preserve the symmetry of the tree, but young oranges, well cared for, are quiet, sensible growers and few suckers appear. Unlike the lemon, the orange tree

With the Return of
Peace and Prosperity
Plant
Teague Quality
Citrus Trees

With the present demand for food stuffs, the return of peace and normal economic conditions there will be a growing demand for all orchard crops and a corresponding larger demand for nursery trees. Already this return is finding expression in an increased demand for Teague Quality Citrus trees, which leads us to advise intending planters to book their orders early, as the available supply of really good, bud-selected (pedigreed) trees is rather limited. For this reason we invite correspondence. Prices cheerfully furnished.

The R. M. Teague Citrus Nurseries
San Dimas, California

The Bolsheviki—I. W. W. strike in the citrus groves has ended.

droops rather than shoots upward. In shaping the tree strong growths out at the ends often are forked, one branch growing above the other. Always remove the under one, never the upper, for the latter only will make a strong branch that will not split away, but it is the one of the twain that bears the fruit. Do not thin out the orange to admit light and air, so the branches show. The outside of an orange tree should present a solid mass of obscuring foliage. If light and air must be admitted it should be from the top, down a central shaft. This part of the tree bears the least fruit and this fruit is most difficult to pick. Therefore the central part may be kept thinned out, but not open. When trees become of good size there is no system of pruning that will prove so profitable as that advocated by J. B. Neff in our issue of December 21, 1918. This is the best method for all old trees, no matter of what kind, as it presents the greatest possible area to the outside. The form suggested is that of a deeply corrugated column. The deep corrugations allow the air and light to reach the interior of the tree and greatly add to the area of the outer or exposed surface. Above all avoid pruning away the lower branches and so thrust the bearing surface or top higher up each year. Some old orchards never bear an orange that can be gathered while standing on the ground. Such orchards have been spoiled by improper pruning. Head down rather than head up. The pomelo or grapefruit needs the same care in pruning as the orange.

CONTRACT SUSTAINED

Cooperative organizations have tried various methods of securing a firm foundation or dependable method of handling the business of their members. Simple membership with a determination to depend only on the honor of the member has been tried. Imposing of fines and penalties has also been tried. But we think as a rule today a strict contract between each individual member and the corporate body which handles the business has been found the best.

Up-to-date Packing House

Hollow tile and concrete citrus packing house of the Anaheim Fruit Growers' Association is being equipped with the most modern up-to-date graders and packing house machinery.

Some of California's cooperative organizations handle a business which requires the placing of orders for supplies, the arranging for labor, the construction of packing houses, involving sometimes hundreds of thousands of dollars. No sane director of any such institution will consent to take any such responsibility unless there are back of him dependable contracts which will give him control of the goods he is supposed to handle. These contracts have been sustained in several cases. The latest one is that of the Prune and Apricot Growers, Inc. A general statement of this case is given as follows:

"In the case of California Prune and Apricot Growers, Inc., vs. A. L. Drown in the superior court of Ventura, the association won its first suit against a non-delivering grower. This is the first instance where the contract has become part of a court action, and consequently of considerable importance since this contract is one of an identical series on which all members are signed. During the course of the case the various terms of the contract and fulfillment by both parties were brought out in detail and the result completely sustains the contract in its entirety.

"The corporation was represented by its attorneys, Sapiro, Neylan and Ehrlich of San Francisco. During the course of two days occupied in the hearing of evidence and argument of counsel, every pertinent detail of the contract, from the time it was entered into by defendant and the corporation up to breach on the part of the defendant, was elaborately discussed. Many cooperative contracts have in the past failed to develop the substantial features necessary to the success of organized efforts; but in this case the California Prune and Apricot Growers are assured the greater respect of the trade, the producers and other interested parties. Their contract—the foundation of any cooperative organization—has been on trial and not found wanting."

KILL THE FREAK

Here is the latest in legislation:

"Section 1. It shall be unlawful for any person, firm, corporation, their agents, servants or employees, to operate any machine used for the spraying of any paints or material that contain any poisonous ingredients consisting of lead, arsenic, salts of mercury, benzol, wood alcohol, aniline, paris green, Scheele's green, barytes or other poisons injurious to the health of workmen either by absorption or inhalation.

"Section 2. It shall be unlawful for any firm, person, corporation, their agents, servants or employees, to operate any spray machine for the painting of any ship, building or structure which contains any kind of poisonous ingredients or materials dangerous by absorption or inhalation to the

How Mohawks Ride on Clay Roads

Mohawk, Keaton or Non-Skid treads are excellent clay road tires.

Their big sturdy projections have the faculty of digging down into the slipperiest kind of a road, holding the car safe.

Right from the beginning we have built Mohawk tires, both the treads that show and the parts underneath that don't show, so that they will give the right sort of service, on clay roads, rocky roads, paved roads, or any other kind of roads, and give a lot of it.

We don't believe that Mohawk users want to pick their roads or spend any great amount of time babying their tires.

We have held to the idea that to give Mohawk users the kind of service they want, we must build a tire that is so extra strong it will always give good big mileage and mighty little trouble no matter where the user may choose to drive.

There is nothing mysterious about the way we accomplish it—just the sensible method of using the finest grade of rubber and fabric in the world, building a reasonable quantity of tires so that we can watch each one carefully, allowing the builders plenty of time to do their work right.

We have kept our company on a very efficient basis—haven't a dollar's worth of watered stock or bonded indebtedness and we are satisfied with a reasonable profit. In this way, we have been able to use these expensive materials—more of them than the average tire maker seems to think he can, and have still been able to sell Mohawks at competitive prices.

That's all there is to it.

As far as we know, almost any maker could have done the same thing if he had been organized the same way we have—had the same ideals and had been able to keep away from the temptation of making bigger profits by using cheaper materials and methods.

The point is that most of them haven't done so.

And that is why Mohawks have stood out from among the great variety of tires on the market and have gained such a reputation for consistent high quality.

The best proof of this is that our records prove that 85% of car owners who buy their first Mohawk tires become permanent Mohawk users.

MOHAWK RUBBER COMPANY
AKRON, OHIO

Branches at:
New York Boston Chicago Atlanta Kansas City San Francisco

MOHAWK "Qualify" TIRES

Mohawk Tires—either Mohawk, Keaton or Non-Skid treads—hold a car safe on clay roads. But there are altogether too many of these bad roads in this country. It is estimated that 20 per cent of our roads carry from 80 to 90 per cent of our traffic. In other words, while we have over 2,000,000 miles of roads, if 400,000 miles were permanently and properly constructed in the right place, they would practically complete our necessary highways.

OUTLOOK FOR BEANS IS BETTER

G. A. Turner, president California Bean Growers' Association now in New York wires with the approval of Food Administration Grain Corporation and has the following to say in respect to the American bean situation: "While investigation not completed and present results preliminary the attitude of grain corporation sympathetic particularly in feeling that management of bean business has not been as free from personal bias as it should have been and has led naturally and justifiably to some distrust on part of trade. This condition will be remedied. Disposition of Grain Corporation will be to assist in improving present situation of bean producers and dealers. Exports now freely allowed and foreign governments are abandoning official buying permitting trade to seek ordinary channels. This will tend to help. Grain Corporation considering possibility of making direct purchases under some equitable system of allotment to different localities. This possibility depends on requirements abroad. Cabling Mr. Hoover about whole matter. Expecting another meeting here next week of California and Michigan dealers and others for consideration of possibilities and hope then to determine some definite policy which can be announced and which will restore confidence in future."—G. A. Turner, February 16.

health of the workmen operating such spray machine.

"Section 5. Provides that every violation of the act shall be deemed a separate offense, and upon conviction shall be punished by a fine of not less than $25, nor more than $500, and imprisonment for not more than six months, or both such fine and imprisonment."

In other words, when the poultryman wishes to kill off the mites and other pests in his hen house he must not use a spray pump. The whitewashing of barns or of storehouses may also be interfered with unless it be done with an old broom or by the still slower method of using a paint brush.

These are the days of labor saving, except where labor unionism has run riot and is demanding the very slowest method of doing work.

Every farmer and warehouseman in the state should rouse up and see that this bill is killed.

KILLING WOOLLY APHIS ON ROOTS

Carbon disulphid, in solution at the rate of one-half ounce to four gallons of water and applied at the rate of three-fourths gallon per square foot of soil, will control the root form of the woolly apple aphis and without injury to the trees under suitable conditions, says the United States department of agriculture, in Bulletin 730, recently published. The solution is prepared by pouring the carbon disulphid into the water and agitating the mixture vigorously. When applied on the soil around a tree the liquid penetrates into the ground and the poison gas given off by the chemical kills the pest. Every square foot of infested soil should be subjected to the action of the solution in order to insure complete control. This may be accomplished by pouring the liquid in a shallow basin in the soil around the tree.

In orchard practice where many trees are to be treated the solution is best applied by using a power spraying outfit and two auxiliary tanks. The advantages of this method, according to the bulletin, are, the even diffusion of the liquid and complete aphid mortality in the soil area treated and the safety with which the disulphid can be used. The disadvantages of the method are: the huge amounts of water required, with consequent high cost of labor; the difficulty on any but level ground of preparing basins with level floors, thus insuring the proper distribution of the liquid over the area to be treated; and the wide area of infested roots on older trees, every square foot of which must be treated with the liquid. This last condition precludes the use of carbon disulphid except on small trees with restricted root areas.

Sodium cyanid, kerosene emulsion and deep planting of trees were other measures of control investigated, but they are not recommended by the department.

Lettuce Production of Imperial County

By R. G. Risser, Bureau of Crop Estimates

ONE of the two important counties in California in the extensive culture and commercial shipping of lettuce is Imperial. On account of the shorter shipping season of Imperial County, however, it is not yet equal to Los Angeles County in its acreage or in yearly carlot shipments. Yet the daily shipments of Imperial County while the bulk of the crop is rolling exceed the daily shipments of Los Angeles County, with its older growing districts, and Imperial County is considered a real factor in the lettuce production of the United States.

The rise of Imperial County into prominence in the lettuce business was rapid. The crop now going to Eastern markets is but the fourth commercial crop to be noticed in the Imperial Valley. In 1915-16 27 cars were shipped. In 1916-17 there were 413. 1917-18 was an unsatisfactory season, but 982 cars were rolled. The acreage planted to lettuce for the 1916-17 crop was 960, for the 1917-18 crop 2500, and for the 1918-19 crop 2650.

The crop is being grown in widely separated parts of the valley. Standing in the order named, in the relative size of their acreage, the shipping points are as follows: Brawley, Heber-Poppy, Imperial and Meloland. Sixteen shippers are handling the crop.

Movement of the Crop

In connection with the question which is so often asked regarding the period of heaviest shipments, the records of the past two seasons are of value. The following data indicate the percentage of the season's total shipments which rolled each month during the past two seasons:

1916-17—December, 0; January, 1; February, 21; March, 43; April 35.

1917-18—December, 1; January, 10; February, 38; March, 49; April, 2.

Outstanding facts revealed by this table are that March has been the month of heaviest shipments both seasons, practically half of the shipments rolling during that month last year; that February has also been an important month both years, and that over a third of the crop moved in April during the year 1916-17. The season of 1918-19 started out differently from either of these two previous seasons, being earlier than 1916-17 and later than 1917-18. But it is likely to resemble them both in a general way.

The Variety

The variety of lettuce grown in Imperial Valley as in other winter lettuce districts of California, belongs to the crisp head type. Some confusion is caused by the fact that the produce trade in the East knows it as "Iceberg" lettuce while the variety generally offered by seedmen as "Iceberg" is distinctly different, although of the same general type. The variety generally grown in California is known to seedmen as the "Los Angeles Market" or the "New York Market," and sometimes as "Wonderful," and does not have the russet tinted leaves which are characteristic of true "Iceberg." There are two more or less distinct strains of the "Los Angeles Market," both of which are grown. One of them runs largely to heads of the flat type, while the other produces heads which are more pointed or conical. Lettuce in the Imperial Valley, particulary during the early stages of growth, makes foliage of a darker green than lettuce grown on the coast. This is not due to a difference in variety, but to environment. It is presumed that the sunshine is the primary cause of the difference.

How It Is Grown

The land is thrown up into beds after plowing, which run the length of the field and are divided by furrows. These beds are generally made about a foot high and two rows of lettuce are usually planted with a drill on each. Plants are thinned to 10 or 12 inches apart. Planting usually starts about October 1 and most of it is finished by November 30. Irrigation is practiced frequently in the furrows between each alternate row. Single row planting is not widely practiced. In cutting the crop the grower usually goes over his field three different times at intervals of a few days, selecting the best heads each time, throwing them in piles and putting them in field crates for delivery at the packing shed.

How It Is Packed

The stock arrives from the field in crates on flat top wagons. It is aimed to have the product on its way East from 12 to 18 hours from the time it is cut. Trimmers cut off the stump squarely, pick off discolored leaves or dead tips and throw it onto a bench for packing. Packers place it in crates lined with paper, the top of the heads all being packed downward side by side in rows with pulverized ice between the layers. The standard crate contains from three to eight dozen head, according to size and looseness of pack. Four and a half to five dozen heads are perhaps the most common pack. Cars are loaded with from 300 to 350 crates.

PAID IN FULL

In April, 1917 you went into a partnership with James Yeager, American.

You wanted protection for your family, your income and the privileges you deemed necessary to proper living.

Several thousand miles away an army of arrogant, outlaw millions had begun a campaign for ruthless world conquest accompanied by crimes against women, children and property. This horror was striding toward your home.

Yeager agreed to receive training, brave the submarines and fight this menace which had taken on forms more terrible than history recorded. As your part of this partnership you were to remain at home, do your part in financing Yeager's crusade, see that his family had financial assistance and pay him $30 a month. You felt that you had a good bargain.

On October 12 1918, near Verdun, Yeager while performing his duties under the terms of the contract was cut off with a few companions in an exposed position under heavy machine gun and artillery fire. He stood off the foe with his automatic rifle until severely wounded.

After lying seven hours with a companion, reinforcements arrived and two stretcher bearers came with only one stretcher. Your partner Yeager demanded that the other man be taken first. When they returned for Yeager he had been released from your contract—he was dead.

Next April just two years after the signing of that agreement you will be asked to carry out the final part of your stipulation by subscribing to the Victory Liberty Loan. Will you meet that obligation cheerfully or begrudgingly?

YEP!

"It's just as wrong to gamble when you win as when you lose." "Yassuh," asserted Mr. Erastus Pinkley. "De immorality is jes' as great, but de inconvenience aint."—Washington Star.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sulphur on the Soil

Your article, "Sulphur and Crop Yield," appearing in the California Cultivator, has been reprinted in our local papers. Our farmers are much interested in the results obtained and expect to make some tests this year. Will you kindly advise me when and just how this sulphur is applied to the soil?—Subscriber, Grand Junction, Colorado.

This question is answered by F. H. Mason, the writer of the article referred to. He says:

The sulphur is sown on the soil, either by hand or machinery, in the same way that grain is sown. It is then plowed or harrowed into the soil, preferably plowed. To insure success it is essential that the sulphur should be very finely ground, or, better still, be in the form of flowers of sulphur, which is a precipitated sublimate. While sulphur seems to have exerted a beneficial influence on all soils, the best and most remarkable results have been obtained from moist, alkaline soils, heavily charged with humus. A soil moisture ranging from 13 to 18 per cent has given the best results, hence more wonderful effects have been obtained in Oregon and Washington where the natural precipitation is greater than in Southern California. Still, if the soil can be kept reasonably moist by irrigation equally good results may be expected in more arid regions. In the case of crops grown from seed, the sulphur should be applied before sowing, with fruit crops before growth starts.

Killing Rodents

Can you tell me if there is a law compelling farmers to kill gophers and squirrels in Monterey County? If so what steps can I take to see that it is done in this neighborhood?—Subscriber, Marina.

Yes. See your county horticultural commissioner.

Paint for Gum Disease

I am pruning an old lemon orchard which has had gum disease and am using linseed oil and a little green point mixed, to cover up cuts and the trunks where I have scraped the dead bark off. I have been told the linseed oil will burn the bark and injure the tree very much. Kindly let me know if this will burn the bark and what is best to use.—Subscriber, Santa Barbara.

Use extreme care in painting with an oily paint over the living bark of orange or lemon tree. It may be used where the bark has all been removed or on the ends of large branches which have been cut off. The best treatment of gum diseased surface is painting with Bordeaux paste: Bluestone, one pound; fresh burned lime, two pounds. Dissolve the bluestone in one gallon water, using wooden or earthen vessel, by hanging it in a sack near the top of the water; slake the lime in about one-half gallon of water. Stir together when cool, making a mixture about the consistency of whitewash. Apply with a brush. May be applied to healthy bark as a preventive. Mix fresh each day or two.

Topping Oranges

What is the proper height to head orange and lemon trees? Would it injure them if headed too high to cut back to just a stub when setting them out?—Subscriber, Fallbrook.

If the nurseryman has not properly topped the trees of course it will be best to do so at planting time but we presume you will find trees when delivered will have been topped at about three or three and one-half feet and are already supplied with some of the laterals which will make the foundation of the tree. If, however, the tree has been allowed to shoot up several feet then it will be necessary to top back and force the laterals to come out where desired.

Sweet Potatoes

Will sweet potatoes mix if they are planted together in the same patch or alternating rows? How would it be possible for them to mix when they have no blossom with pollen to be scattered by bees or insects?—Subscriber, Phoenix.

Such mixing will in no way affect the quality or the use of these potatoes for seed. Of course if the potatoes of the two varieties are similar in appearance it will be understood that care must be taken in digging to keep perfect separation. In the case of the Irish potato where the "seed ball" end is to be used for the purpose of creating a new variety then the matter of pollination enters.

Real Estate Commission

A Santa Ana subscriber sends unsigned letter with request for information as to real estate commission, but the statement is so hopelessly confused that it is impossible to determine what he wants to know. And here is one more reason why it is useless to waste three cents in sending unsigned letters.

Cutting Off Frozen Oranges

As a rule after the severe freez of 1913 in orchards where the fruit was so badly injured as to be unmarketable the fruit was clipped off and plowed under. The theory is that there may be sufficient life in the orange to draw some nourishment from the tree. The fact that it does this is one reason why Valencia growers will permit the fruit to remain on the tree where the frost has not been too severe in the hope that new cells will be formed and the fruit again fill with juice. Presumably your fruit has not been entirely destroyed. In such case at time of picking the sound fruit we would remove that which has been injured and drop to the ground. We would not, however, think the injury severe enough to call for rushing to work at once.

Red Spider

Will you kindly let me know all about the red spider, its habits and the best way to keep it under control? I have an almond and peach orchard which was affected with red spider last year.—Subscriber, Madera.

Such a question calls for altogether too long an answer to give in these columns, for there have been books

Why There Is a Scarcity of Hudson Super-Sixes

No Open Cars to Be Built for Months—Hudson Closed Car Demand Exceeds Production

No automobiles were to have been built after January 1st.

Then, all of a sudden, the ban was lifted.

It produced a confusion the trade had never experienced. For months all makers had been turning out all the cars they could, regardless of the immediate market for them. By spring it was believed automobiles would be so scarce that buyers would accept less wanted makes if they could not get the car of their choice.

Then cars that had not sold freely during the summer and fall would have a ready market when the more desirable makes were out of the way. For one thing—

There Would Be No Hudsons Then

That was one of the expected conditions. Super-Six sales all season, just as they have for three years, absorbed the factory output. Hudson dealers were not able to get cars for future needs. It looked as though they either would have to close up shop or take on one of the less wanted lines.

But withdrawal of manufacturing restrictions assured a limited quantity of Hudsons. Less wanted cars after all, would have to meet Super-Six competition.

Hudson production is now concentrated on closed models, for which there is an excess demand. Some dealers have a limited number of open models—though not enough to meet early spring requirements.

You either must take one of the open cars they now have or wait until late spring if you get a Super-Six Phaeton.

Note Why Hudson Is so Popular

For three years the Super-Six has held undisputed leadership among fine cars.

Remember how it first established itself on the speedway and in countless endurance tests. Rivals refused to admit Hudson had developed a new type motor with greater power and endurance.

Yet those amazing records were made commonplace by later Super-Sixes. Thousands of owners made just as wonderful demonstrations with their own cars, when you consider the conditions, as were those under official test. Every car made converts to the Super-Six. Today 60,000 are in service.

It Created Styles that Others Followed

Hudson created the Sedan and the Touring Limousine. Now more expensive cars have followed and cheaper cars, too, are effecting models of Hudson type.

The seven- and the four-passenger Phaetons are pattern cars for so many other makes, that if it were not that the Super-Six is always a year or more in advance of others, one might be confused in recognizing the true arbiter. Two new types are now ready—the Coupe—a four-passenger—and the Cabriolet for three.

Why Delivery Is Possible Just Now

The Super-Sixes now available in *open car types* are all that can be had for several months. It will be June before full factory production can be resumed.

With the first promise of spring open cars become the favorite type. If you delay, and an open Super-Six is your choice, you will probably find all have been sold. Then you may have to wait until late spring.

The demand for all closed model Super-Sixes is so great that you must speak promptly to assure delivery. With some models this may mean quite a while.

Hudson Motor Car Company

Detroit, Michigan

Its White Triangle and Price are Two of Motordom's Most Distinctive Marks of Value. The Seven-Passenger Phaeton sells at $2200

(1003)

"This Is the Stuff"

"*Now* I can get those trees planted in jig time. The last time that I planted—two years ago—I tried *Dynamite* to blast the holes instead of digging them. You should see those trees now! They're nearly twice the size of my neighbor's, planted at the same time in the old fashioned way. They'll be making good money for me before his are even in blossom."

HERCULES DYNAMITE

"It's certainly great stuff! When you've once used it you'll wonder how you ever got along without it. My advice to you is to send to the Hercules Powder Co. for a copy of their book 'Progressive Cultivation.' This book will tell you all about the uses of dynamite on the farm and in the orchard. And they send it to you free! You just sign the coupon at the bottom of their advertisement and mail it to them. Better send for one of these books today—so you can use dynamite to help you plant *your* orchard this spring."

DiscHarrows

We have nine distinct styles of Disc Harrows. A Harrow for every use. 3 feet to 12 feet in width of cut. 14 to 20 inch discs, solid or cutaway. No assortment so complete. Call and see them or write for catalogue. We are headquarters.

ARNOTT & CO., Inc., 112-18 S. Los Angeles St., Los Angeles

published on the question. Would suggest where one wants to know all about the red spider to write Agricultural Experiment Station, University of California, Berkeley, California, and ask for Bulletins 145 and 234, both on the red spider of the citrus fruits. In addition ask for Bulletin 297, "The Almond in California." On page 56 and following pages formulas and methods of handling the pests are given. In a word lime-sulphur, commercial solution, one gallon to ten gallons of water, applied before buds open in the spring. Then during growing season dry sulphur is dusted into the tree with blowers, or lime-sulphur, commercial, referred to before, may be used after leafing out at the rate of 35 gallons of water to one gallon of the commercial mixture. The control of red spider is also discussed at considerable length in the monthly bulletin of the State Commission of Horticulture, Volume VII No. 3, Page 112.

White Wyandottes

Have been thinking about raising White Wyandotte chickens this spring. Are they good layers? What color and what size eggs do they lay? Does the meat retain its flavor after the fowls grow old?—Subscriber, Encinitas.

White Wyandottes are amongst the finest of our general purpose fowl. They are good layers, laying eggs in color from cream to very light brown, medium sized, and the meat is of the finest even with the older birds. The commercial egg fowl of the Pacific Coast is the Leghorn, but where just enough eggs to supply the home are wanted there is nothing better than the American breeds.

Borer

Please tell me how to prevent disease and borers in young fruit trees, especially in plum and peach, which always are on the southwest side of the tree. How can I prevent apples from getting wormy on the tree?—Subscriber, Merced.

For the borers which infest the trees on the southwest side the best protection is a system of pruning which so shades the trunk that it never sunburns and makes for conditions attractive to the borers. However the peach tree borer has no need for conditions being bettered for he proceeds to attack healthy tree trunks. Where these are already infesting the trees it is well to either use sharp knife or chisel and cut out the pest, or, better, use wire and insert it into an opening which may be made into the channel and force it to follow until the worms are killed. Then band a strip around the tree, running well below the soil, at least eight inches wide, using asphaltum, or if preferred here is what is known as the California whitewash: Quick lime 30 pounds, tallow 4 pounds, salt 5 pounds, enough water to make mixture flow freely.

Garden Tractor

A letter without address makes request for information as to $100 "garden tractor". We believe there is no such machine put out. There is a garden tractor but its cost is more than double the amount suggested. We hope that the $100 garden implement will yet come.

PRUNING THE LEMON

Continued from Page 237

What to Expect From Different Kinds of Growth

Sucker Wood—If a tree is allowed to grow to sucker wood it may be expected to grow fast and rank. Trees of this kind of wood make large trees in a short time. They do not bear early but look fine and make an excellent advertisement for the real estate agent. As such trees age they may be expected to bear satisfactory crops for a time but the tree soon becomes unwieldly and shows a poor habit

of growth. The fruit is borne on the end of fishpole-like canes which bend over with the weight of the fruit and then grow more fishpoles on top, which in turn bear fruit at the end and bend down. The fruit is whipped about by the wind and is wind scarred. Moreover, trees from this kind of growth deteriorate relatively early and there is some evidence to show that the fruit they bear is of poorer quality than that from fruit wood. This kind of growth is undesirable and should be vigorously excluded.

Fruit Wood—Trees made up of fruit wood grow slowly and do not make the fine looking trees that are produced from sucker wood but they are precocious and bear early. They bear the best quality of fruit, large amounts of it, and we have no knowledge of how long they may be expected to bear satisfactory crops. Our experience has been too short. Many full bearing trees of this kind of wood are still bearing excellent crops with no signs of deterioration. Moreover, the trees are compact and easy to handle. This kind of growth is desirable and should be retained in the tree.

Intermediate Wood—Trees allowed to grow to intermediate types of wood are in the main of the same general nature as those formed from sucker wood but are somewhat more variable. Some trees of this kind are much better than sucker wood trees and some are apparently worse. Mr. Englehart believes that "white wood" is the worst kind of all. Suffice it to say that all kinds of intermediate wood are undesirable and should be avoided when possible.

When all three kinds are permitted to grow in the same tree there is a certain amount of competition between them, the sucker wood always getting the best of the bargain. Fundamentally, all sucker growth is parasitic and slowly but surely starves the rest of the tree.

Changing Sucker Wood to Fruit Wood

Sucker wood can be induced to fruit in a number of ways. There are three factors which can act to cause this change, of which the most important is light. When suckers reach the light they branch out and fruit. If the tree is kept open enough to allow light to filter in, suckers will branch and fruit. Another factor is horizontal position. As long as a sucker is upright it does not tend to branch but when it is bent over either by the weight of the fruit on the end or by other means it will branch out and fruit. Checking the rapidity of sap flow seems to bear a relation to inducing sucker wood to bear. By repeated severe pruning suckers can be caused to branch and bear fruit. The sap flow is cut down and the vigorous growth tendency checked.

Advantage has been taken of this fact that sucker growth can be curbed and induced to fruit by many lemon growers to use this kind of growth to form the main framework of the tree and then select to the best wood which is produced on these limbs. In this way the grower can exercise some control over the framework formation of his trees whereas if he rigorously prunes out everything but the best fruit wood, framework formation is largely fortuitous. Also by thus being able to form the scaffold branches a somewhat stronger tree can on the average be obtained than by any other system.

Bud Selection—It can readily be seen that since there are different kinds of growth on the same tree there is a lack of possibility of getting different kinds of buds from the same tree. A lack of recognition of this fact has worked untold injury to our lemon industry. Buds from these different kinds of wood behave differently. Buds from the best fruit wood tend to produce trees of that kind and the same is true of buds from sucker and intermediate growth. Until comparatively recently buds have been selected indiscriminately from all kinds of growth, the preponderance being from sucker and intermediate kinds of wood, and our orchards are now conglomerate mixtures of good, fair, poor and worthless trees.

Wood Selection—But bud selection does not go far enough. Even the best strains from fruit wood give rise to sucker and intermediate types of growth and these must be excluded. Trees grown from poor buds require constant pruning to keep out the most undesirable classes of wood. In other words, after bud selection must come wood selection and the latter is by no means the unimportant half. From these remarks one can readily see why one tree may require little or no pruning while the next in the row may need vigorous pruning several times a year. One is from a good bud; the other from a poor bud. The writer has seen young orchards propagated from very fine fruit wood buds where the pruning shear has never been used. Sooner or later, however, some undesirable growth will appear when it must be cut out.

In brief, a rational system for lemon pruning would seem to be the first to insist on having trees propagated from the best type of fruit wood only; second, rigorously exclude all other types of growth except where necessary to build the frame work; and third, keep the tree open enough to induce the bearing of heavy crops on the inside.

Unfortunately, most growers do not have the supervision of their trees from the beginning, but must take them either already grown from the nursery or planted out in the orchard. Working back old trees is quite a different matter from training young trees. But that is another story.

Let's Have a "Humane Society" for Tractors

By C. L. Butler

THE man who neglects his horses can be disciplined by the law. The man who neglects his tractor will be disciplined by the cost. Neither ignorance of the law nor of the tractor will serve as an excuse.

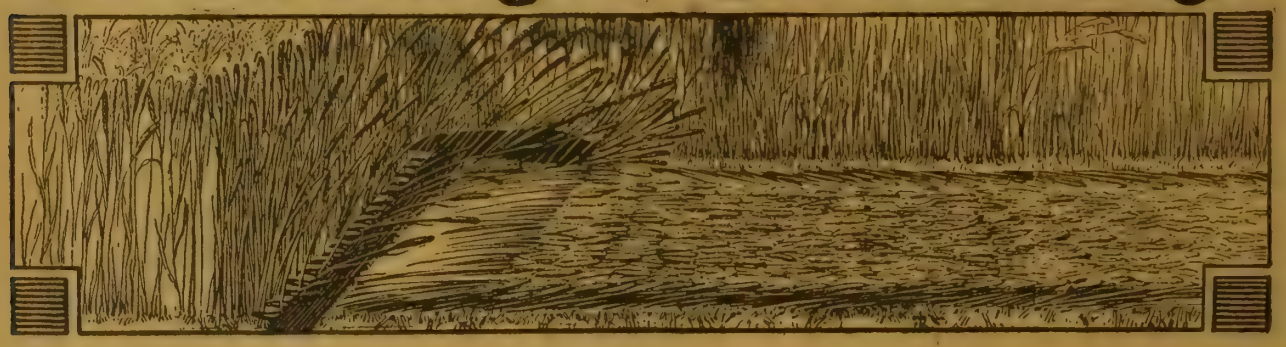
Before the tractor achieves the success that both the farmer and manufacturer anticipate, it will be known and cared for. The farmers must be made to appreciate the tremendous amount of work done by a tractor—and particularly its motor—every season. He cannot continue to measure the life of a tractor in years. Things happen too quick. The crank shaft revolves too many times—65,000,000 times an average season. Before long he will respect the tractor for its worth, for the amount of work it does both in acres covered and in work done under the hood. As soon as the farmer expects less he will get more from his tractor.

To the man who knows them gasoline motors are simple. There is nothing mysterious about carburetors, magnetos, water pumps, connecting rods, clutches, gears and the like. It takes time, but not excessive time to make repairs. The good mechanic undertakes his work with his mind at ease. He knows that haste makes waste with a gasoline motor, absolutely and always. He knows, too, that a stitch in time saves nine, both in time and money.

It is not work, nor the dislike of it, that bothers the farmer in the care of his tractor. It is uncertainty, doubt. He is not sure what is wrong. Nor will he be until he and the tractor get acquainted. The first tractor a farmer gets will cost him more than his second—it did with automobiles—I guess it did with horses.

You've probably had your brother's boy come from the city to visit you. Wanted to give him a good time so you loaned him a horse for a ride. He was used to speed, so he galloped right along. Some city lads are ornery, but your brother's boy is not, just lots of enthusiasm. He wanted speed and got it. Before he knew it your horse was in a frothy sweat. So the lad stopped at the river to give him a nice long drink. If it weren't for the chickens it would have been a total loss. It sure happened quick—and the lad meant well. It cost $200 to replace that horse.

Now get this! Ignorance about tractors—and horses—costs money. Here is an example. It is about four in the afternoon and two miles to the house. You forgot to put oil in the motor when you came out in the morning. You didn't realize it then. The tractor seemed to be heating more than usual as you pulled up the long back slope. At first you thought it was on low water. The water sure was hot, but there was plenty of it. It was a mighty hot day at that, perhaps that was the reason. So away you go on up to the turn and around the corner on the down slope. About this time you remember that you forgot to fill with oil when you left in the morning. A look shows that the level is low, all right, but the gauge on the dash still shows oil. You figure to yourself, "That tractor agent told me not to run without oil, but I guess she's got enough. I sure don't want to foot it back to the house and I can't quit this time of the afternoon. Oh, well, a couple of rounds won't hurt it. Besides, she seems to be doing better on the down pull." The tractor cooled off enough before you reached the lower turn for you to just about forget it. Around you swing and up the slope. Pretty soon she seems to lug a little. "It doesn't look like a hard pull; the plows seem to be coming along mighty nice, but it sure is needing more throttle. By gosh! What's the matter? Is this cheap heap goin' to lay down on a pull like this? Thunder! the oil gauge isn't running. Well, if the darn machine ain't stalled! Lordy, boy, she sure is hot. Smell 'er, won't you! Don't look like she'll finish out the day. Too hot to do anything now. Guess I'll lay off and bring out the oil in the morning." But it's all over, the damage done. In the morning you find that she won't turn over. Can't crank her on a bet. Naturally not! Oil so low that the up pitch dropped the level below the rods and the oil pump. Hot when you rounded the corner, the motor froze tight as a drum in a few minutes on the up grade. Too little oil and the pistons and cylinders are melted right together. If you are lucky a reboring job and new oversized pistons will save something. Otherwise it's a new motor. A trip back to the house would have taken a good hour, but it would have saved a couple of hundred dollars and lots of time.



Neglect costs money. Too much water killed the horse; not enough oil ruined the motor. A little in each would have saved both.

You wouldn't beat your horse through a hard pull. Then why beat your tractor? The slow lugging strain of an overload is a terrible beating to a motor. It will stand a lot of work if it is given a chance, but it will quit in a few minutes of abuse. Remember this, that your tractor motor does more work in a season than your automobile does in all its life. Respect it for the wonderful work it does and care for it accordingly.

If a horse goes lame he gets a rest or a veterinarian. If a tractor goes lame—a missing cylinder, say—it gets more work. Often times the operator does not even recognize the difference, except maybe the job seems short of power. Or if he does he figures he can get by till quitting time. He can, but not for nothing; it will cost money to run a sick tractor as it does to run a sick horse. Some day the farmer will be as sensitive to the abuse of a tractor as he is to the abuse of a horse. His senses will warn him before the damage is done. In the meantime it will cost him more to operate his tractor. Education of any kind costs, both effort and money, but it is worth it.

Manufacturers will eventually organize a "Society for the Prevention of Cruelty to Tractors," possibly under another name. But the work to be done is the same, a more concerted effort to get the information to the farmer and see that he uses it. It will sell more tractors and keep them sold.

$4.00 to $10.00 More Per Ton for Your Hay

THERE is frequently a difference of from $4 to $10 per ton between choice hay and hay that grades No. 3. It is to your interest to raise the best grade of hay possible. You can do this by applying the Dain System of air-curing hay. This requires only the use of the Dain System Rake.

When the mower passes over the field the heads of the hay fall back, as shown in the illustration above. You can follow the mower closely with the Dain System Rake—turn the hay while the leaves are still active, delivering it in medium-size windrows on clean, dried-out stubble. Raking against the heads places the bulk of the leaves on the inside where they cannot sun-scorch, and the stems on the outside, insuring thorough evaporation of moisture.

By adjusting the angle of the teeth the density of the windrow is controlled, allowing free circulation of air. *And the Dain System Rake has the widest range of tooth adjustment.*

It is an easy rake to operate. You can put machine in and out of gear, change the angle of the teeth and raise or lower the raking head with levers that are accessible from the seat.

The Dain System Rake has unusual capacity. This is made possible by the high steel arch and an exclusive feature—*the inclined frame,* which is highest at the point where the windrow is largest.

The Dain System Rake is enabling thousands of farmers to make hay that grades high. Get this extra profit out of your hay land by employing the Dain System of air-curing hay.

WORLD POSITION FOR AMERICAN FARMING

There is no cause for alarm as to the future ability of the United States to hold its due place in the trade of the world and especially as to the ability of American agriculture to maintain its position in the world readjustment that must follow the ending of the war. This is the judgment of the United States department of agriculture.

A detailed survey of the agricultural situation shows the impossibility of forecasting the conditions that will obtain when the 1919 crops are matured, but it is pointed out that the markets of the world are opening up for American products and that a considerable demand from European countries for food stuffs is almost assured for a year or more.

The signing of the armistice found the United States with fairly large stocks of foods but with smaller than usual stocks of feeds. In response to increased needs for food, many farmers plowed up permanent pastures and other grass lands needed for live stock and planted them to grain crops while others broke their rotation systems and planted the same land to grain several years in succession, thus reducing the fertility.

Would Increase Live Stock

Now that farming is to be restored to a peace time basis, many of the lands suitable for meadow or pasture should be reseeded to grass, that regular and satisfactory rotations of crops should be established, and that live stock should find a place on a larger number of farms. These readjustments appear to be necessary in order to meet the still urgent demand for meats and fats, as well as to restore sound farm practice.

A wise live stock program, the department concludes after reviewing all conditions, will involve maintaining the number of horses and mules without material increase, a normal increase in the number of dairy cows and dairy products, a normal increase in the number of beef cattle, a con-

servative policy with respect to increasing the number of swine until the relative shortage and high price of feeds is overcome, an increase in sheep consistent with facilities for feeding and pasturage and the farmer's skill in handling them, and an increase in farm flocks of poultry where a minimum of purchased feed is required.

Many Factors Affect Wheat

The indicated plant program is not quite so definite. The proper policy as to wheat depends upon a complicated set of conditions, but it seems certain that the farmers of the United States will be justified in maintaining their acreage of corn, oats and barley, large productions of which are necessary to maintain normal live stock production.

It appears desirable to increase the production of hay by about 25 per cent. The cotton situation depends largely upon the ability of the European countries to buy in average prewar quantities, but the practice recommended is for the individual farmer to adjust his cotton acreage so as to have sufficient land available to produce enough food and feed for his family and live stock. An average acreage of potatoes is justified. Peanut production, abnormally stimulated by the demand for oil during the war, should be readjusted as a part of the crop economy in the territory to which it is adapted. The department urges those who intend to maintain home gardens to plan to meet the needs of the family rather than to produce crops for market.

BEET SUGAR CROP, 1918

The production of beet sugar in the United States from the beet harvest of 1918 is estimated at 740,100 short tons. This estimate is based upon reports made before the close of the season and is subject to revision. The production in 1917 was 765,207 short tons. The area harvested in 1918 is estimated at 592,100 acres, or 72,697 acres less than in 1917. The area planted was 689,700 acres in 1918, and 806,600 acres in 1917. In 1918 there was 14 per cent of the planted acreage abandoned, and in 1917 25 per cent, which was the highest on record.

The beets worked in factories in 1918 are estimated at 5,822,600 short tons and were purchased at an average price to growers of $10.02 per ton, as compared with $7.39 in 1917.

The principal sugar producing states, with their output for 1918, are: Colorado, 182,700 short tons; Utah, 118,000; Michigan, 117,600; California, 109,300; Ohio, 43,100; Wisconsin, 14,300; and all other states, 111,000 short tons.

The acreage harvested in these states was: Colorado, 126,500; Michigan, 108,200; California, 102,40; Utah, 83,600; Ohio, 33,300; Idaho, 32,600; Wisconsin, 12,600; and all other states, 92,900 acres.

The beets worked in these states were: Colorado, 1,412,200 short tons; Utah, 1,012,900; Michigan, 873,700; California, 843,700; Idaho, 336,600; Ohio, 328,900; Wisconsin, 110,400; and all other states, 904,200 short tons.

KILL THE SQUIRREL

The unanimity with which the whole country went to work planning for the prosecution of the war has inspired us along other lines and today from one end of California to the other the cry is heard "Kill the squirrel." The grain grower, live stock feeder, fruit grower, in fact every producing activity has awakened to the awful loss which has been visited upon us by the ground squirrel. Here is a circular being distributed by the Sperry Flour Company. The Sperry people will pay higher prices for wheat than will the squirrels.

* * *

KILL THE SQUIRRELS

Now is the time to go after the squirrels!

Do the job up thoroughly.

If your wheat fields are infested with squirrels get rid of them without delay. It will cost only a few cents an acre, but you can afford to spend a dollar an acre if necessary.

Last year on the Sperry Experimental Farm two hills of squirrel holes were somehow overlooked, and in consequence an acre of grain surrounding each set of holes was destroyed. The average for the field was 12 sacks of wheat. At, say, $4.50 a sack this amounted to $50 an acre. This is too costly for any farmer to tolerate.

Get either carbon bi-sulphide or "kilmol," which can be purchased through the county horticultural commissioner in the court house, at $5.50 and $6.00 respectively, per five gallon can. One can is enough for at least 300 holes. Soak the waste balls (which can be bought through the same source at $1.50 for 400) with the poison and roll down the hole. Drop a lighted match into the hole and close the hole at once, tamping it tight. Be sure and keep the can away from the explosion.

Important! Get your neighbors to do the same.

Do this work now and do it thoroughly.

AMERICAN EGG LAYING CONTEST

By T. E. Quisenberry, Leavenworth, Kansas

Practically every pen has now started to lay. The White Leghorn made the best averages for December. One pen, No. 6, from Missouri, laid 120 eggs, which was the best December record we have ever had. A Buff Orpington pullet laid 29 eggs during the month. A Silver Wyandotte leads for the two months with 44 eggs. A White Wyandotte pen from Canada stands next to the White Leghorns with 131 eggs to their credit. As a whole, the breeders should be pleased with their December records.

The averages made by the different varieties for the month of December were as follows:

Variety	Leader Eggs	Best pen for Dec. Eggs	Av. Pullet 2 M'ths Eggs	Pul. Layer 2 M'ths Eggs	High Pen 2 M'ths Eggs
Brown Leghorn	22	54	7.0	29	62
White Leghorn	27	120	22.1	43	170
Buff Leghorn	23	74	12.8	36	104
Anconas	14	58	13.8	30	78
Buff Minorcas	25	57	15.4	40	88
White Plymouth Rock	16	48	6.3	17	52
Buff Rocks	21	53	7.6	21	53
B. Rocks	25	73	11.6	42	102
S. C. Reds	21	47	5.8	30	48
R. C. Reds	16	34	9.2	30	63
W. Wyn.	24	84	14.5	38	131
Silver Wyn.	28	51	7.1	44	85
W. Orpingtons	25	73	14.1	38	89
Buff Orpington	29	59	9.5	42	72

DISINFECT SEED POTATOES BEFORE PLANTING

The same disinfectant as applied to wheat last fall to control smut can be used to control the common scab on Irish potatoes. This disease, as well as several other potato diseases, is carried on the seed. All these diseases can be largely controlled, where potatoes are planted on new land each year, by disinfecting the seed before planting. There are several ways of doing this, but the method recommended by the University of Missouri college of agriculture for the average grower is to use formalin. Use it at the same strength as for wheat, one pint of the 40 per cent formalin solution, costing about 50 cents, to 30 gallons of water. Ordinarily the seed are put into a sack and immersed in

You Can Plow Deep In Wet Land with a

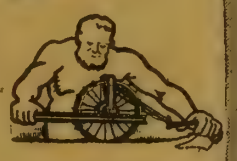
Nilson

the Tractor with the Famous Lever Hitch

THE first duty of a tractor is **traction.** It may have the strongest motor in the world but if the wheels slip, the tractor is useless.

There are two ways to obtain traction—by weight and by the lever and fulcrum principle.

It was Archimedes who said, "Give me a fulcrum on which to place my lever and with these hands will I lift the world."



This is the principle of the famous **lever hitch.** Instead of employing a straight line drag from the engine to the plows, the lever hitch carries the pull **up over** the drive wheels and then **down** to the plows. The Nilson Patented Lever Hitch gives the drive wheel grip without excess weight. It increases traction when it is most needed. It saves fuel, it prevents slippage. It does not pack the ground.

The lever hitch is patented.

It is found only in the Nilson—the tractor with the famous Waukesha Motor, Hyatt Roller Bearings, Nilson Perfex Radiator, K-W Ignition with impulse starter and Bennett Air Cleaner.

The Nilson comes in two styles, the Junior and the Senior. The Senior pulls four and five plows, the Junior three and four. The Nilson is the recognized five wheel tractor devoting the entire width of the tractor to surface contact. It has proven its efficiency by more than four years successful work.

You cannot afford to make a mistake in the choice of your tractor this year. You need a light, powerful tractor that will work in any sort of soil or weather. You will find it when you have examined the Nilson.

The lever hitch carries the pull of the plows up over the drive wheel. The harder the pull, the harder the wheel grips the ground.

Top Dressing Talks

When should ARCADIAN Sulphate of Ammonia be applied to citrus crops?

For Oranges. On lighter types of soil, the application of from 400 to 600 pounds of ARCADIAN Sulphate of Ammonia per acre is advised, where it is the only source of nitrogen used, and on heavier types of soil about half as much. The total amount should be made in several instalments rather than one: first, early in March; the second when the fruit begins to "set"; a third about the middle of June and a fourth some time in September. The last application is to help "size" the fruit as well as aid wood and bud growth for the next season.

For Lemons. As they are in continuous bearing, it is advisable to increase the number of applications to six consisting of from ¾ to 1½ pounds per tree.

For Grapefruit. It is necessary that they size up well. The bulk of the Sulphate should be applied during the latter half of the growing season, the application being generally a third larger than for oranges on a similar soil.

Arcadian Sulphate of Ammonia

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in U.S.A.

Heavy Duty Orchard Cultivator No. 3

Killefer Quality

Killefer Efficiency

The Heavy Duty Orchard Cultivator Number 3 is built to meet the demand of the owners of the small size tractors for an extra strong cultivator that can be handled by the tractor driver. It is made on the same lines and of the same high-grade steel as our well known Monarch Cultivator, but without the levers and rear wheel, and with a hand wheel screw lift, making it a perfect one-man, all-steel tool.

Specifications: Frame, ⅜ x 2½ inches angle iron, Standards ⅝ x 2 inches special high-grade steel, Axles 1½ inches, Wheels 22 inches high, 3½ inch tire. Made in 5, 6, 7 and 8 foot sizes. This tool will be at the Tractor Demonstration at Sacramento, May 5 to 10.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Los Angeles, Cal.

More Economical Handling of Grain

Safe against fire, weather, rats, and thieves, grain stored in these two Calco Metal Grain Bins on the Crocker-Hoffman Ranch at Merced is an asset instead of a liability. The 11,000 bushels these two bins hold can be handled quickly and inexpensively from thresher to bin and tank wagons, and a small portable tubular steel elevator. A simple conveyor system, operating in a tunnel, built under the foundations, brings the stored grain out as needed. These two Calco bins form the first of a battery of twelve or fifteen, the conveyor system, etc., having been planned so it may be extended.

this solution for one and a half to two hours. It has been found that the treatment can be reduced to 15 minutes if the solution is heated to 122 degrees Fahrenheit. Besides saving time, the treatment is probably more effective when the solution is warmed. The formalin solution can be used over and over until it is gone. The seed must be treated before cutting and it is better if they can be spread out to dry after being treated.

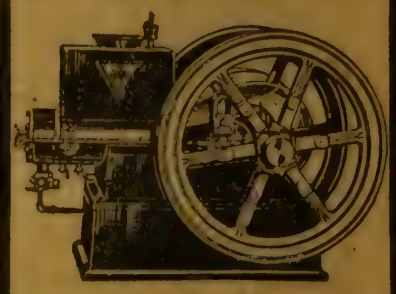
The sweet potato is also attacked by several diseases carried on the seed tubers. For this reason they should be disinfected before bedding, where the diseases have caused loss in previous years. The material used is corrosive sublimate, one part to 1000 of water, or one ounce to eight gallons of water if a crude form is used. The powder should be dissolved in a little warm water, then made up to the right volume. The seed tubers are soaked in this for ten minutes, just before bedding them in the hotbed.

TRACTOR SHORT COURSE AT THE CITRUS EXPERIMENT STATION

One of the special features of the gas tractor short course to be given by the University of California at the citrus experiment station February 24 to March 1, will be the meetings to be held Monday and Thursday evenings, in the Polytechnic High School. Several educational films illustrating the manufacturing of tractors and their operation will be shown.

Dean Thomas F. Hunt of the college of agriculture, Berkeley, who spent several months in England and France as a member of the agricultural commission sent by the United States department of agriculture to study the agricultural problems of the war stricken zone, will give the lecture at the meeting Monday evening taking as his subject, 'The Problems of Reconstruction and Agricultural Needs of France and England." This will be illustrated by lantern slides picturing the agriculture of these countries and showing some of the devastated areas in France.

Lectures for the meeting Thursday evening will be given by Dr. H. J. Webber, director citrus experiment station; J. B. Davidson, professor of agricultural engineering, University of California, and J. A. Prizer, superintendent of cultivation, citrus experiment station.



The course as arranged will consist of two one hour lectures each day to be given by Professor J. B. Davidson, who is to be in charge of the course. A certain portion of the student's time will be given to the operation of the various tractors while class room work will cover the following subjects: Bearings—babbitting, scraping and adjusting; soldering, radiator repair, valve grinding, and piston ring fitting; tractor operation and inspection; tractor overhauling; carburetor construction and adjustment; magnetos. Various cross section models, accessories and parts will be used in the classroom work.

The following makes of tractors will be used during the course: Best, Bean, Cleveland, Fordson, Holt, International, Moline, Samson, Sandusky and Yuba.

Board and lodging will have to be procured in town (three miles from the citrus experiment station).

Registration fee of $1.00 constitutes the only charge for the course. Anyone may register, applications accompanied by the registration fee should be sent to the Dean, Citrus Experiment Station, Riverside.

ALPHA

Pumping Engines

A superior line of engines built up to one standard of quality—the highest—from the 1¾ H. P. to 18 H. P. size.

Compare the ALPHA with any other engine. It is much more carefully made — you can see that at once. Alpha Quality means—longer life, better satisfaction, lowest operating cost, no troubles, better results. The easiest starting, most perfectly balanced engine made.

10 Searching Questions About the Maxwell and 10 Frank Answers; Read Them, for They May Decide Your Choice of a Car

Q.—Reduced to one point what is the single greatest thing you can say about the Maxwell?

A.—It is reliable.

Q.—What makes it reliable?

A.—The chassis was designed five years ago to be extremely simple. Then we kept on making and making Maxwells all alike on this chassis year after year until now we have made 300,000 of them. Our policy is to do one thing well and thus obtain perfection.

Q.—Have you changed the original design any?

A.—Not in any single fundamental. We have added an improvement here and there from time to time—but no changes from our original program.

Q.—Have there been any great chassis improvements in the last 5 years?

A.—We believe not. There have been multi-cylinder cars and multi-valve cars; but in a car under $1000 we do not believe them to be practical.

Q.—How much of the Maxwell car do you build?

A.—We believe that we manufacture more of the parts that go into our car than any other manufacturer.

Q.—Why do you do this—can you not buy parts from others cheaper than you can build them?

A.—In some cases yes; but not so good as we can build them. In other cases no, for we operate 8 great plants, have an investment that runs into many millions of dollars, carry a tremendous inventory, have a rapid "turnover" and a large one. Besides, we make parts for cars other than our own including some that cost in excess of $4000.

Q.—Has the Maxwell every modern equipment?

A.—Yes, even including the carrying of the gas tank in the rear.

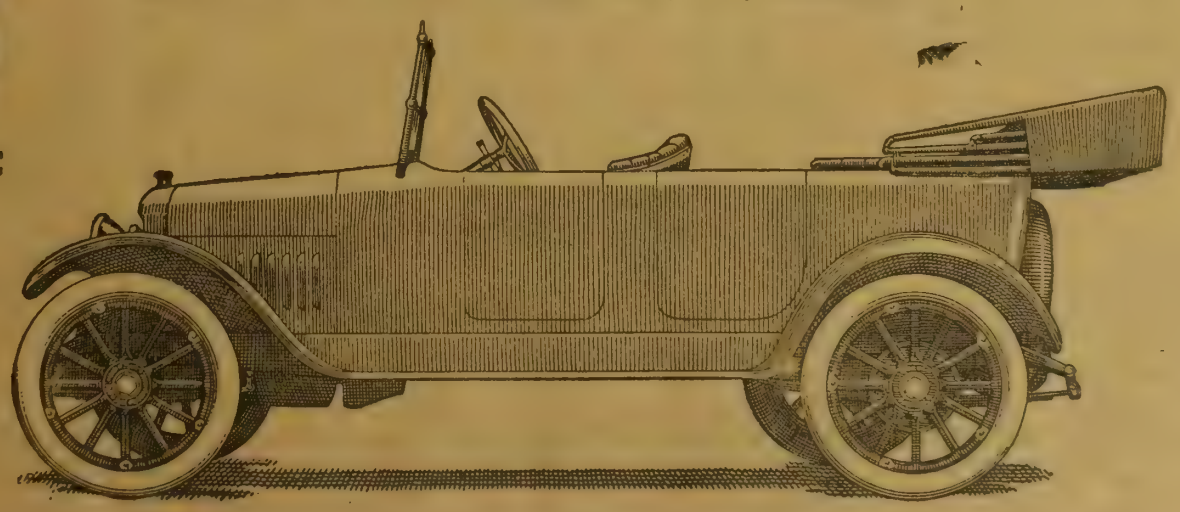
Q.—Have you improved the appearance of the Maxwell any?

A.—Yes. We have made a vast improvement in the last few months—so much so that many persons thought we produced a new model. Note the illustration. This is drawn from a photograph without the slightest exaggeration.

Q.—How about parts?

A.—There are $5,000,000 in parts carried by 2500 Maxwell dealers all over the United States.

Q.—Will you reduce the present price if I buy a Maxwell now?



A.—No. The present price is guaranteed until July

California Cattlemen Complete Organization

In a recent letter mailed to the members of the California Cattlemen's Association, President L. A. Nares and Secretary D. J. Stollery announce that the plan of organization launched at the meeting of cattlemen at the University Farm, Davis, last year has become a fact and that to date the association has a membership of 800 cattlemen who control about 400,000 cattle, or nearly one-fourth of all the stock cattle owned in this state.

The plan of organization as originally conceived by President Nares was as follows:

The state was divived into five zones. In each zone, county or local organizations were formed. Five delegates from each county were appointed to attend the zone convention. At this convention, five zone directors were elected to the central board of the state association. From among the directors of each zone a president was named, and he automatically becomes a vice president of the central board. The 25 zone directors then met and elected the president and other officers.

The plan as outlined met with instant success and so effective has it been that the executive committee of the American National Live Stock Association has asked for the complete plan with a view of urging that all associations affiliated with the American National adopt the same plan.

Apparently the officers of the California Cattlemen's Association are determined to make it a real working organization. An active membership campaign is being waged and an effort will be made to enroll at least 60 per cent of the cattlemen in this state.

The association proposes to concern itself with every problem affecting the cattle industry. As outlined in its articles, it proposes:

"To procure the enactment of legislation beneficial to the cattle industry.

"To prevent the theft of cattle, to aid in prosecution therefor, and to offer rewards for the apprehension of criminals.

"To procure the best possible market for cattle products, and to this end prevent combinations and monopolies.

"To act as a bureau for the collection and distribution of information concerning prices, sales, shipments, supply and demand of cattle, and other matters of interest.

"To enlarge the market for cattle products.

"To promulgate sound and correct principles of breeding, fitting and marketing cattle.

"To make beneficial traffic agreements."

Following is a complete list of officers and directors:

Officers—L. A. Nares, president; M. D. Lack, first vice president; S. C. Dorn, second vice president; Howard V. Jack, third vice president; J. W. Guiberson, fourth vice president; O. B. Fuller, fifth vice president; Merchants National Bank of San Francisco, treasurer; Geo. A. Clough, attorney; David J. Stollery, secretary.

Directors—Zone I: M. D. Lack, Redding, president; J. B. Parker, Callahan, vice president; N. V. Wemple, Milford; J. H. Boyce, Weaverville; P. S. Dorris, Alturas.

Zone II: S. C. Dorn, Oroville, president; Frank Gordon, Suisun, vice president; T. H. Ramsay, Red Bluff; J. D. Granlees, Slough House; Will Russ, Eureka.

Zone III: Howard V. Jack, Cholame, president; E. G. Rodolph, San Francisco, vice president; John Bryan, Hollister; J. McGlinchey, Livermore; C. Z. Hebert, Salinas.

Zone IV: J. W. Guiberson, Corcoran, president; Stephen M. Pate, Le Grand, vice president; A. S. Goode, Bakersfield; Louis Frankenheimer, Stockton; L. A. Nares, Fresno

Zone V: O. B. Fuller, Los Angeles, president; Fred H. Bixby, Long Beach, vice president; James Sloan, Lompoc; Frank Butler, Bishop; Harry Jones, Brawley.

The office of the association is 320 Sharon Building, San Francisco.

Holsteins | Holsteins

What is Your Best Family?

AS YOU look over the herd of registered Holsteins that you have built up through years of breeding thought and effort, isn't there a family in your herd that stands out as the one of all others that you consider your BEST? Haven't you in your herd a cow that is such a great dairy producer and reproducer that you have often said "I wish I had a string like her?"

Great breeding herds and great fortunes in the breeding business have often been built upon a single great cow, and many times upon a great family. The great difficulty has been to purchase these outstanding individuals from the owners in whose hands they have proved their worth.

The Holstein Breeders' Guaranty Sale will be composed of great individual members of proven families. A Committee of Selection composed of four members, Frank L. Morris, Harry V. Bridgford, James W. McAlister, Jr., and C. L. Hughes, visited many of the best Pacific Coast herds and picked for this sale animals that are among the very best the breeders own, in fact in a number of instances the highest record, best bred, and best individual animals in the whole herd have been chosen. It has at times taken a mighty lot of persuasion to secure the entry of members of the breeder's very best and most highly prized family, and he has yielded only to the call of duty in advancing the best interests of the breed through giving other men an opportunity to found herds with the highest class animals obtainable.

As a result of this broad spirited response from leading breeders, we claim positively and without a single qualification that there has been assembled for this sale the greatest group of registered Holsteins ever offered in a one day sale in the world. We have never overstated the entries in a sale, and we are confident that you will agree that we have not overstated in this instance when you see the great animals and their wonderful pedigrees.

THE GUARANTY SALE

Thursday, March 27, 1919
State Fair Grounds, Sacramento, California

will be the time and place of this wonderful offering, which will consist of approximately 65 head of registered Holstein cows, heifers, and bulls. A description of every attractive animal in the sale would mean a recital of the entire catalog, but here are some of the good ones:

SOME WONDERFUL COWS AND HEIFERS BRED TO THE $106,000.00 BULL, CARNATION KING SYLVIA!
THE GREATEST COMBINATION OF KING SEGIS-PONTIAC KORNDYKE BLOOD EVER OFFERED IN A SINGLE CONSIGNMENT IN THE WEST. THE FEMALES ALL BY BETTER THAN 30-POUND SIRES AND MOSTLY OUT OF BETTER THAN 30 POUND DAMS, BRED TO JUDGE SEGIS!
BEAUTIFUL DAUGHTERS AND SONS OF "IT" OUT OF 29 TO 35 POUND DAUGHTERS OF KING SEGIS PONTIAC AND KING OF THE PONTIACS!
DAUGHTERS OF PRINCE GELSCHE WALKER, OUT OF 31 AND 32 POUND DAMS, BRED TO THE 34 POUND BULL, SIR AAGGIE MEAD DE KOL, THE ONLY BULL IN THE WORLD WHOSE SEVEN NEAREST DAMS AVERAGE OVER 1000 POUNDS BUTTER IN ONE YEAR!
THE GREAT 37 POUND COW BOWEDA, THE HIGHEST RECORD COW EVER SOLD ON THE PACIFIC COAST!

CONTROLLING CATTLE SCAB

Small insect-like parasites, commonly known as mites, are responsible for cattle scab, a contagious skin disease affecting cattle of all ages and conditions. There are several forms of the disease known by such names as "scab," "mange," and "itch." Though the disease itself may not cause death directly it is responsible for serious losses by causing a shrinkage in the weight of animals, failure of young stock to thrive and gain weight normally, and by increasing the death rate of poorly nourished animals of poor vitality, especially range cattle exposed to inclement weather. Cattle scab can be eradicated by dipping or spraying, dipping being the most reliable method, and lime-sulphur, nicotin, and crude petroleum dips can all be used with success.

WOOL CONSUMED

Seven hundred and forty million pounds of wool, grease equivalent, were used by manufacturers in the United States during 1918. Much of this wool went into clothes for soldiers, while the old clothes man called in vain for the shiny and patched garments worn by civilians at home.

Military needs kept the monthly consumption of wool to an average of 65,500,000 pounds, grease equivalent, for the first ten months of 1918, but in November it fell to 47,000,000 and in December to 38,300,000 pounds, as announced by the bureau of markets, United States department of agriculture.

Massachusetts mills used more wool in 1918 than any other four states combined. During May mills used 74,600,000 pounds of wool, the largest monthly consumption reported, while March and April each showed more than 70,000,000 pounds used by manufacturers.

THE VALUE OF PURE BRED RANGE STOCK

"The value of pure bred stock is strikingly brought out by the experiences of two grazing permittees," says Forest Supervisor D. N. Rogers in his Annual Grazing Report to the district forester at San Francisco. "One man, owning pure bred Hereford cattle, sold coming two year old steers averaging 1000 pounds in weight for an average price of $80 per

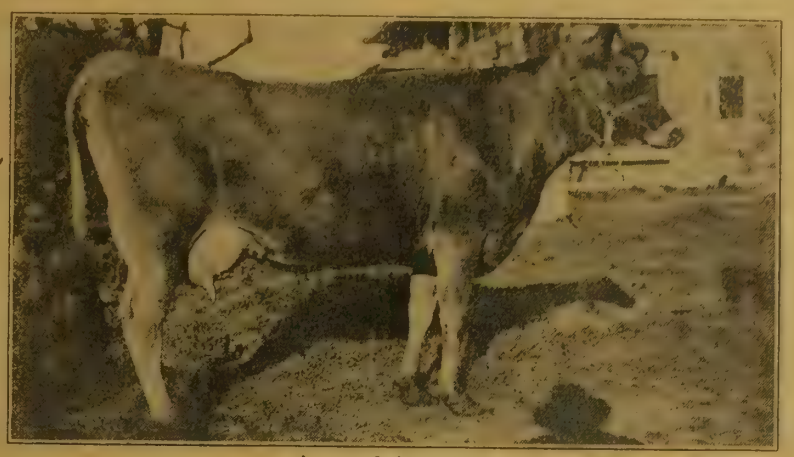
head. A second man, owning scrub stock, sold two and three year old steers averaging 900 pounds in weight for an average price of $80 per head."

But the feeding of a properly balanced ration during the winter also has its value, particularly when applied to well bred stock, as is further shown by Forest Supervisor Roger's grazing report. The following instance is cited:

W. J. Clinch, a rancher in American Valley, sold a carload of beef, the average weight per steer being 1372 pounds, and the average price per head being $160. This beef dressed out 63 per cent. The cattle were two year old Hereford and Shorthorn crosses. They were fed six pounds of grain each for five months during the winter, in addition to hay. They were kept entirely upon the Clinch ranch. They had been fed hay for seven or eight days, in addition to pasturage, before weighing.

FOUR SOURCES OF DIRTY MILK

Which end of the bottle do you observe in judging the quality of the milk you buy? Look at the bottom of the bottle now and then and make sure the milk is free from visible dirt. The depth of the cream column in a bottle of milk should be considered only after the bottom of the bottle has been examined for sediment. Sediment in the bottom of a milk bottle indicates carelessness in the production, care and handling of the milk.



The sources of dirt in milk, as stated by W. B. Combs of the University of Missouri college of agriculture, are: Dirty cows, dirty utensils and bottles, a dirty dairyman, and dirty surroundings.

The dairymen of Mesa, Arizona, recently organized with A. S. Haymoor as chairman and Grant Laymen as secretary.

LORA OF VENADERA—YEAR TEST

Guy H. Miller, Modesto, reports the yearly Register of Merit test of the junior three year old heifer Lora of Venadera, finished February 7. For the year she gave 10,705 pounds of milk which contained 504 pounds of butter fat. She was milked but twice daily and ran with the rest of the herd throughout the year.

Lora of Venadera made a Register of Merit test of 386 pounds of fat in a year as a two year old. She won the five day butter fat contest at the state fair in the heifer class as a two year old and won the California Jersey futurity stake. She is a daughter of our well known herd sire, Altama Interest, and her dam is Lorna of Venadera, who has a Register of Merit test of 588 pounds of fat and was a well known prize winner in the show ring a few years ago.

Lora of Venadera

Register of Merit test 10,705 pounds milk, 504 pounds butter fat in a year. Sire, Altama Interest; dam, Lorna of Venadera. Bred, owned and tested in Guy Miller's Venadera herd.

USE ROUGHNESS TO SUPPLEMENT EXPENSIVE FEED

The judicious use of roughness for live stock on the farm throughout the winter is one means of increasing profits that is sometimes overlooked. Oat straw, and even wheat straw to some extent, corn stover and pasture can be utilized. Animals being fattened for market and animals during the first year of their growth should not be expected to consume large quantities of cheap roughness, but horses, mules, cattle and some classes of sheep that are being carried through the winter can be fed rations carrying appreciable quantities of cheaper roughness, provided they are properly supplemented with nitrogenous feeds of the right sort such as leguminous hays or linseed or cotton seed meal.

If oat straw can be substituted for hay, it is a saving of at least 50 per cent, and experimental work has demonstrated that through the winter, work horses, mules and cattle can use oat straw instead of timothy or mixed hay to good advantage, provided proper supplements are fed.

Economy should not be carried to the point where it endangers the lives of animals, says E. A. Trowbridge of the University of Missouri College of Agriculture, but careful consideration of winter rations should be given on every farm.

PREVENT PARALYSIS IN EWES

Every lambing season reports come to the University of California experiment station of the loss of fat ewes a few days before lambing. Those carrying more than one lamb are most frequently affected. This disease is known as "preparturient paralysis" and manifests itself by listlessness, aimless movements, tremors, distorted vision and paralysis, followed by death in five to eight days. It has been found to follow the feeding of highly nutritious and especially dry feed and the lack of exercise.

Prevention of this condition has been highly successful, while treatment is usually of no avail. Prevention consists in avoiding circumstances that made for excessive deposition of fat. This can be done by limiting dry feed to ewes in the last month of pregnancy and by making them rustle for their food. Grazing in pastures containing green feed for one or two hours a day will have the effect of giving them succulent food and exercise at the time.

"Preparturient Paralysis", a leaflet by J. Traum, describes more in detail the cause, treatment and prevention of the disease and is free to the residents of this state on application to Director, Agricultural Experiment Station, Berkeley.

A REAL DAIRY BULL
From a 900 Pound Dam

Do you know that it takes a real cow to produce 900 pounds butter in a year? And do you know what a real bull from a producing sire and such a dam would be worth to your herd?
We can offer just such a bull and at a price within the reach of any progressive dairyman.
His dam is about to complete a year right around 900 pounds with second calf and in addition to this she has the type that you would like to breed into your herd, a show cow with beautiful level udder and large well placed teats.
For seven days she has a 26 pound record, but you will be more interested in what she did the other 358 days.
His sire has produced five two year olds (first tested) that average 753 pounds in a year.
His dam and sire's dam average 990 pounds butter in one year and over 29 pounds butter in seven days.
In addition to this he will suit you as an individual, light in color and past eleven months old. Price $300.00.

A. W. Morris & Sons Corporation
Woodland, Cal.

The Proof of the Pudding

KING KORNDYKE PONTIAC 20TH as a calf looked like the real bull to head our herd, adding to his great individuality the backing of a pedigree with an unbroken line of great producing dams and type of the highest character. The price of $6500.00 which we paid for him was really a minor consideration. Now that his calves are coming on we know that we made a fortunate choice, for they are certainly beauties. His oldest son in our herd was sold at 40 days of age to become the future head of a newly established Stanislaus County herd.

And the last six calves by King have all been heifers, mostly white in color, beautiful individuals, and every one of them has large well placed teats, just what we expect from the great uddered cows in his ancestry.

Better get in touch with us for one of his young sons for YOUR herd. We already have requests for reservations of unborn calves if they are bulls. Satisfaction of the buyer is our first consideration, and our prices are reasonable.

Our Entire Herd is Tuberculin Tested

Live Stock News Notes

Worthy Granddaughter of Tilly Alcartra

Princess Roma Alcarta, owned by the J. S. Gibson Co., Williams, previously reported as having passed the 30 pound mark, has now increased her record to 31.53 pounds butter from 576.1 pounds milk, beginning exactly one month after calving. This heifer also has just completed a 30 day record of 125.55 pounds butter and 2493.1 pounds milk. "Princess Roma" is a daughter of Prince Alcartra Korndyke and granddaughter of Tilly Alcartra. She is a senior four year old and made her records at second calving, being three and a half years old when she freshened the first time, making at that time 22.55 pounds butter in seven days. This heifer had no preparation for the test and barely went dry from the first freshening.

From Durocs to Shropshire Sheep

Dr. L. J. Belknap of San Jose, whose herds of Jersey cattle and Duroc-Jersey hogs are quite well known, finds that it is no longer practical to maintain his herd of hogs and accordingly he will disperse his entire herd on Tuesday, March 18.

The sale will be held at the Garden City Sanitarium, which is within the city limits of San Jose.

About 30 head will be sold and will include three aged sows, one two year old boar, six fall boars and nine fall gilts. Two of the sows, Lucy Orion and Mabel D., are litter mates, being sired by Orion Model and out of Lulu Wonder. They were bred by Elmer Lamb and will be two years old March 4. They are sows of exceptional size.

The herd boar Orion Model Jr., by Orion Model and out of Queen of Stanislaus, is quite a good boar and will doubtless be appreciated. The young stuff, mostly of fall farrow, has been well grown out and for the most part are the offering of the sows and boar mentioned above.

Dr. Belknap is planning to establish a high class flock of Shropshire sheep and has recently commissioned Professor Coffey, the well known sheep expert of the University of Illinois, to select and purchase for him 25 thoroughly first class ewes and a ram of similar class.

Junior Two Year Old on Test

A junior two year old daughter of King Korndyke Pontiac recently made over 21 pounds butter in seven days on official test. She is owned by Fred W. Kiesel, Jane Garden Farm, Sacramento.

Thirty-one Pounds and Still Going

Roma Princess Alcartra, who is by Prince Alcartra Korndyke, son of Tilly Alcartra, has increased her seven day butter record to well over 31 pounds in seven days and is still on test. She is a senior four year old granddaughter of Tilly Alcartra and is owned by the J. S. Gibson Company, Williams.

Aralia De Kol Duchess

Aralia De Kol Duchess, a junior four year old daughter of Aralia De Kol Pontiac Segis, now on test in the A. W. Morris & Sons herd at Woodland, has 27.75 pounds butter to her credit the first seven days on test. She is the first daughter of Aralia De Kol Pontiac Segis to complete yearly records. As a senior two year old she made 17,152.4 pounds milk and 764.88 pounds butter in one year, indicating that this son of Aralia De Kol is transmitting the production of his famous dam.

Highest Record on Pacific Coast

The previously reported record of 37 pounds butter in seven days for Adirondac Wietske Dairy Maid, owned by Bridgford Company, Knightsen, was just a starter, it seems. This great cow now has over 831 pounds milk and 41.03 pounds butter to her credit and is still on test. This is the highest record ever made on the Pacific Coast.

California Record for Butter In One Year

Aralia De Kol Mead 2nd, a junior two year old daughter of Segis Pontiac De Kol Burke and Aralia De Kol Mead, recently completed a yearly record of 18,785.6 pounds milk and 851.01 pounds butter in the A. W. Morris & Sons herd, Woodland. This gives her the California state record for butter in one year in the junior two year old class, and is another splendid performance in the Aralia De Kol family.

Yearly Record for Tulare County

Wayne of Rock, at Tulare Holstein Farm, owned by W. J. Higdon, Tulare, recently finished a year's test with 17,707.6 pounds milk and 802.63 pounds butter, the highest yearly Holstein record yet completed in Tulare County. Some of the good short time records recently completed in the Higdon herd are: Pauline Soldene De Kol 3d, 30.84 pounds butter from 576.1 pounds milk in seven days; Mona Fobes, a senior four year old daughter of Mutual Fobes Longfield De Kol, 26.61 pounds butter from 523.8 pounds milk in seven days; Troutbrook Pontiac Starin, 25.51 pounds butter from 571 pounds milk in seven days.

Another 40 Pounder

The latest record of 40 pounds butter in seven days reported by Superintendent Malcolm H. Gardner of the Holstein-Friesian Advanced Registry is for the senior three year old heifer Matador Hengerveld Bess, who is credited with 600 pounds milk and 40.25 pounds butter in seven days and still on test. Her sire, Matador Segis Walker, is the senior herd sire at Carnation Stock Farm, Seattle, Washington, and some splendid females bred to him will be sold in the Holstein Breeders' Guaranty Sale at Sacramento on March 27.

Fair Oaks Reports Sales

Fair Oaks Ranch at Willits reports Shorthorn sales as follows: Bull to B. Mitchell, Spyrock; bull to G. Schwend, Sherwood; bull calf to Mr. Brayton, Cloverdale; bull calf to Dowling Brothers, Ukiah; three heifers and two bulls to Wm. Muir, Willits; 14 cows and bull to D. Wimmer, Willits; four heifers to R. P. Cornell, Galt; two bulls to Jones & Price, Lakeport; three heifers to Sydney G. Clark, Napa County. Berkshire sales as follows: Boar to Mr. Tuttle, Garterville; boar to Clifford Bishop, Fort Bragg; boar to Chas. Tuck, Willits; boar to Mr. Ramsey, Spyrock; three sows to Smith & Miller, Ukiah.

Army Horses Average $230

The highest price paid at a recent sale of surplus army horses in Great Britian was $408, 50 horses averaged $230, 20 mules were sold and made up to $117. At another sale, where 95 horses and ten mules were offered, the prices ranged from $276 down, the average being $146.

Jerseys Sold

W. J. Hackett of Ceres reports the sale of two more of his pure bred Jerseys, one to Mr. Herndon, Ceres, and one to Mr. Cornwell, Modesto.

The Redwoods Ayrshire Farm at La Honda, San Mateo County, reports the sale of their Robin Hood Ayrshire triplet heifers to E. B. McFarland, of Steybrae Farm, San Mateo. These calves were sired by Mr. McFarland's great typey bull, Willowmoor Robin Hood 32d. Robin Hood 32d recently died but during his day was known among Ayrshire breeders as a great bull to mark his offspring like himself. The Redwoods Ayrshire Farm at La Honda have increased their herd by the purchase of four registered cows from McFarland's Steybrae herd. "The Redwoods" are creating a herd of Ayrshires for the production of butterfat and do not plan to show any stock. They selected the Ayrshire cattle for their mountain farm on account of their hardiness, large production of rich milk and also for the fact that they produce a quality of meat similar to the Durham in color and finish. These people do not believe in selling every male calf as a bull as they recognize that there are scrubs among pure breds as well as among grade cattle.

Orland Jersey Club Thriving

A. J. Morey, treasurer of the Orland Jersey Cattle Club, reports that the affairs of Jersey breeders in Glenn County are in very prosperous condition. Practically all members are keeping all of the female increase and have only a few bull calves for sale from time to time.

The registered hog business is a valuable adjunct to this Jersey business. Mr. Morey is now establishing a Berkshire herd, having secured two young sows from John Cornwall of Orland.

A Brother to Champions in Spring Shorthorn Sale

According to David J. Stollery, secretary of the California Shorthorn Breeders' Association, there is every reason to expect that the sale to be held at the University Farm, Davis, Tuesday, April 8, will touch the high mark for California Shorthorn sales.

Most of the 55 head to be offered were originally selected to sell in the sale that was scheduled to be held in connection with the San Francisco show, and represent some of the best productions of the leading California herds.

The offering will consist of 30 bulls and 25 females, and among the lot will be included cattle that are of sufficient class to enter the best herds.

One of the chief attractions will be the young bull California Model, that is being consigned by the University of California. The young bull, a senior calf last year, is probably one of the most attractively bred bulls ever offered in California, and would be an attraction in any sale.

He is a very flashy roan sired by Sultan Mayflower, the university herd bull, a son of Sultan Stamp, who in turn was one of the greatest sons of the mighty Whitehall Sultan. The dam of California Model is Glenbrook's Marvel, a granddaughter of Whitehall Sultan. Such breeding is rare enough, but when it is known that the dam, produced the celebrated cross-bred steer, California Favorite, grand champion at the 1916 International, and when bred to Sultan Mayflower produced the steer California Marvel, grand champion at the 1917 Pacific International Live Stock Show at Portland, and champion Shorthorn steer at the 1918 International, the value of the breeding back of California Model can be appreciated.

It is axiomatic that a great bull must have a great sire and dam, and if this be true, California Model may confidently be expected to prove a sire of exceptional worth.

Besides the above bull, there will be many other choice young bulls and females, of which we will have more to say later.

Making a Profit From Ditch Banks

Writing in a recent issue of the National Woolgrower E. F. Rinehart, extension animal husbandry expert, says that Idaho ranchers have found that pasturing ditch banks with sheep is a profitable operation, and cites the following instances:

C. S. Phillips of Rupert has an 80-acre farm through which there is a lateral 1364 feet in length, having a width of ten feet. Two years ago this bank produced a heavy growth of blue grass, white clover, sweet clover, some alfalfa, willows and weeds. This bank was fenced off, enclosing 4.33 acres.

This pasture kept a total of 129 head of registered Hampshire ewes and lambs grazed by alternate two-week periods. This grazing is equivalent to 64 ewes and lambs grazed continuously on 4.33 acres, or an average of 14 head to the acre.

A ditch bank of 37 acres owned by C. W. Brannon of Ruper, was enclosed by a temporary fence and pastured by forty-three "bum" lambs for fifteen days. It was found that in consuming one acre of this pasture the 43 lambs gained 264.5 pounds or 6.13 pounds a head. At 14 cents a pound this amounted to return of $37.03 an acre.

No more labor was required in building the temporary fence than would be necessary to cut the weeds and willows. In addition to the profits secured, the lambs cleaned up the ditch banks in excellent shape.

Buttermaking

Buttermaking begins with the production of the milk. Good butter can be made only from good, clean flavored cream. To obtain practically all the cream from the milk and have it in the best condition requires the use of a cream separator.

The thorough cleaning and sterilizing of all dairy utensils is essential to the production of butter of good flavor.

Cream for buttermaking should contain about 30 per cent butter fat. A gallon of such cream will yield about three pounds of butter.

Cream should be kept as cold as possible until time for ripening, when it should be warmed to from 65 to 75 degrees Fahrenheit and held at that temperature until a mild acid flavor is developed.

A thermometer should always be used in order to know that proper temperatures have been obtained.

Cream that is overripe (too sour) makes poor butter.

The churning temperature should be such that (1) the churning will require from 30 to 40 minutes, and (2) the butter granules will be firm without being hard—usually from 52 degrees to 60 degrees Fahrenheit in summer and from 58 degrees to 66 degrees Fahrenheit in winter.

All churning utensils should be cleaned, scalded and cooled before they are used.

The churn should be stopped when the butter granules are the size of grains of wheat.

The butter, in the granular condition, should be washed twice with pure water at about the same temperature as the buttermilk.

Buttermilk must be washed out, not worked out.

Salt should be added at the rate of about three-quarters of an ounce to the pound of butter.

Butter should be carefully worked until the salt is evenly distributed and a solid, smooth body is formed. The best butter has a waxy body, a bright appearance, and, when a slab is broken, a grain like broken steel.

Overworked butter has a sticky, salvy body, a dull, greasy appearance, and a gummy grain. Its keeping properties are not so good as in properly worked butter.

Mottled butter is caused by the uneven distribution of salt.

Butter for market should be in prints, wrapped in parchment paper and inclosed in paraffined cartons.

SOME REASONS FOR HIGH PRICES

Under date of November 22 a New York butter house wrote to a western creamery as follows:

"We enclose herewith account sales for your shipment of butter received yesterday. Market very firm at 66 cents and we look for continued high prices for some time to come owing to the scarcity and light receipts of fancy butter. We congratulate you on securing the highest price ever known."

To this the secretary of the creamery replied as follows:

"We accept your congratulations in the friendly spirit in which they are tendered, but I am not sure whether the dairyman is to be congratulated or pitied. With hay $30 a ton, grain up to $50 a ton, cows from $100 up to most any price, competent dairy hands $75 a month, the balance sheet at the end of the month looks mighty interesting; in fact many are abandoning the business."

So there are two sides to the question but one would naturally infer that with butter selling around 65 cents at wholesale the farmers should be making money out of the business.—New York Produce Review.

Secretary Chas. W. Paine of the Stallion Registration Board writes: "The California Stallion Registration Board has issued, during the month of January, one hundred more licenses than for the same month last year, which shows that the people are beginning to realize the scarcity of horses and the demand there will be for them in the very near future."

Four 18 x 40 Indianas,
Milbrae Dairy, San Francisco.

18 x 30 Indiana—
George Simon, Turlock, California.

Two 20 x 40 Indianas—
Sanitary Dairy, El Centro, California.

From Orland to El Centro
—From Santa Clara to Owens Valley

Like almost every other state of the Union, California has put Indiana Silos to the test—and found them right. They lead in numbers, because they lead in service.

Cheaper feed is the vital issue with California dairymen and stockmen now, and will continue to be for a long time to come. Hay and mill feed are too high priced to yield profits. Nothing will do so much to lower feeding costs as an Indiana Silo.

This "Wizard of the Live Stock World" takes otherwise worthless crops in its great wooden belly, and turns them into rich, succulent, money-saving feed. Corn stalks, weedy alfalfa, hay and grain crops that the rain would spoil—sun flowers—all these are being used by owners of the Indiana Silo in California. Even Yucca and Russian thistles—the pestilents—have been made usable for silage.

INDIANA SILO

From Maine to California, Indiana Silo has proved itself supreme as a producer of cheap feed. In the great live stock centers of California, Indiana Silos lead all others. And in the dairy industry, Indianas are being erected in sets of two to four silos to a ranch. This page shows pictures of Indiana Silos used by leading Dairymen.

Unsigned communications receive no attention.

Warts on Teat

I have a good Jersey cow that has very large warts on one of her teats which are bothersome when milking her. Is there anything that can be used on them to get rid of them or any other way of having them removed? When is the best time to treat them; when she is dry or when she is milking?—Subscriber, Porterville.

Warts are an abnormal growth of the papilla of the outer skin. If the warts have a small base tie a strong cord tight around the base and let them drop off or clip them off and touch the spot with the end of a wire that is red hot. If the warts are flat and have a large base the process is slower. Oil them every day with castor oil. That sometimes takes them away quickly. Nitric acid is good to remove warts but must be handled carefully. Apply a little to the top of the wart about twice a week; each time rubbing off what the acid has killed. The acid should be handled with care as it is very caustic and will burn your flesh or clothing and leave a hole. When the wart is all killed keep the place well softened with fresh butter or mutton tallow and it will heal quickly.

Wart on Ear

My two year old colt has a lump on her ear about the size of a baseball. It looks like a wart and has a slight discharge at all times. The veterinarian said it was a wart and cut it off but it has been growing larger since then. Please advise me what to do for it.—Subscriber, Corte Madera.

The fact that there is a slight discharge indicates that there is a sack somewhere under the wart that constantly secretes the discharge. The veterinarian should trace the canal from which the discharge comes to the very bottom and dissect it all out, then by removing the enlargement it will heal up all right. It may be one of those dental tumors that has a small, irregular shaped tooth located near the ear. Call your vet. back and make him do it right. In a growth of that kind there are usually some very large blood vessels but he can control the hemorrhage.

Correction of Error

By some mistake in copying or in setting up the work for printing, an error was made in the article on "Fails to Breed" at the bottom of page 233 of the Cultivator of February 15.

The tonic suggested should read: Six ounces of powdered gentian, three ounces of powdered nux vomica, three ounces of the sulphate of iron and four ounces of good corn meal.

The error in the article would make the dose of nux vomica too large but still not serious. Those who would make use of the formula please note the change.

Blind Staggers; Pigs Again

If the articles on diseases of pigs, the one under the heading "Pigs Dying" on page 116 of the Cultivator of January 25 and the other under the heading "Scabby Pigs" on page 232 of the Cultivator of February 15, were to be compared one would find a similarity of symptoms and be led to believe the trouble is the same in both instances. Since publishing these articles a subscriber friend writes of his experience with similar trouble with his pigs. He held post mortem and found nothing unusual, but in relating the incident to a neighbor he attributed the trouble to the clogging of the large pores in the legs and said he had cured them by rubbing the legs vigorously with a corn cob or curry comb. He named the disease "Blind Staggers" and gave the direct cause as due to mud and dirt. In that case our advice for scabby pigs would be all right. The corn cob treatment is all right, but the addition of a good bath with plenty of warm water and soap would help also. Cleaning up and whitewashing the pen should also not be neglected.

We wish to thank the subscriber for writing us of his experience and the information he gained from the neighbor. The object of this column is to give advice that is practical and can be followed by stock owners in general. Frequently we would like to advise the use of the most modern remedies but should we do so you could not get the medicine nor administer it if you had it. This may seem strange but is true nevertheless. The up to date remedies are only offered to the profession and are not found in the drug stores because there is so little call for them the druggist can not afford to keep them. We always try to prescribe something that any druggist can supply and almost anybody can administer. This we believe does the most good.

Torn Womb

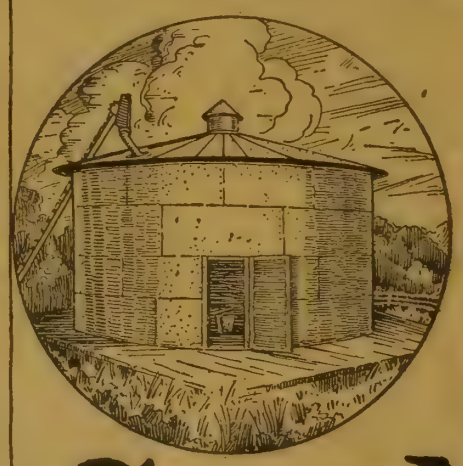
We have a cow that gave birth to her second calf about a week ago and since that time she has bloody mucus discharges. I have examined the womb and believe it is badly torn. For the last two days have douched the womb with a creolin solution twice daily and also given her a dose of linseed oil. This discharge seems to be decreasing and she appears some easier. Will the torn parts heal without being attended to?—Subscriber, Chalfant.

You are doing about all that can be done for the cow. Probably by the time you read this you will not need the douche any more. Once a day for two or three days is usually enough. You can overdo it. Keep her clean on the outside, for there is where the infection starts if at all. Very little can be done for the torn parts now. At the time she was fresh it might have been stitched but usually those tears heal as well or better without stitching. When giving linseed oil always be sure it is the raw and not the boiled oil. It is always good also to add two ounces of turpentine to the oil as it is a good internal antiseptic and goes through the whole system.

Walla Walla, Washington, reports raising 3000 tons of sugar beets in that vicinity this past season.

How big is a leak?

THERE'S ONE THING SURE ABOUT A LEAK—IT NEVER GETS SMALLER. It leaks more—never less.



One big milling concern in California has found that it has to resack about 15% of grain shipped to it in sacks—because of bad leaks.

On shipments of 100 tons of sacked grain, at this rate, a leak is 15 tons big.

In your own fields the leaks in sacks costs more than you think. Every rat—a leak maker—costs you $1.50 a year. Rain causes leaks in sacks. Weak sacks—many are *weak*—leak quickly. Bad sewing causes leaks.

Stop Losing Grain with Leaky Sacks

Handle your grain in bulk. Calco Metal Grain Bins do not leak—they save costs of sacks, rat-feed, loss by rain, stop the thief and keep away the fire.

Calco Grain Bins cost just once—when you buy. They pay for themselves quickly and then—cost nothing.

Mills and railroads prefer to handle grain in bulk. They are equipped for it now. It costs less—saves more.

Write for the booklet "Calco Grain Bins." Read about the comparative costs of handling grain in sacks and in bulk. The booklet is free—write for it NOW.

BUNTING'S MISSION—HEREFORDS

Two years ago last fall John A. Bunting of Mission San Jose purchased his first Hereford cow, today he has a herd of 26 head. Of course, the present herd does not represent the normal increase from the original cow—most of the herd has been purchased—but it does represent John Bunting's faith in the pure bred cattle business—especially the Hereford—and the quality of the cattle to be found in the Mission herd indicates that he is determined to build one of the first herds of California.

When Bunting decided to enter the Hereford business he recognized two points, first, that owing to his limited capital (he will frankly tell you that he borrowed the money to make his first purchase) he must needs start modestly; and second, that if he reached a high place he would have to breed good cattle, and good cattle are not bred from a poor foundation. Bunting did not make the mistake so often made by beginners who operate on limited capital. So many, in an effort to make their money go as far as possible content themselves by buying quantity instead of quality. No top herd was ever built from an inferior foundation. Occasionally men who "laid in" the cheaper sorts have gone high in their respective breed circles—but they usually find that before they reach their goal it is first necessary to practically begin over again.

So Bunting bought a good cow—as good as he could afford. Later he added one or two more well bred heifers. Then he began to look around for a bull. He didn't need a bull at the time, but he expected to and he wanted a good bull. It happened that in the University herd a bull calf had just been dropped. He was sired by Hopeful Prince 2nd, by Prince Lad 11th (sire of the champion steer, California Favorite), and was out of the good cow, Miss Sophia, a granddaughter of Beau Donald. The breeding was all right—but how about the price? One thousand dollars! Rather stiff for a beginner with only a few cows and operating on borrowed money. Bunting bought the calf—and his friends and neighbors laughed. But at the 1918 California State Fair Bunting had the grand champion Hereford bull. His next purchase was a cow at a price above $500. More fun for the neighbors. This cow, Anxiety Clarice, had a heifer calf at foot, and was rebred. The heifer, Miss Betty, was junior and grand champion at the 1918 state fair, and her owner values her at $2000.

Clarice's next calf was a bull, Anxiety Fairfax, and a price hasn't been placed on him. Clarice now has another calf.

Another cow, Pearl Ranier, by Mr. Perfection by Perfection 2nd, a full brother to the sire of the noted Perfection Fairfax, cost less money than Clarice, but she produced a bull calf, Alec, that Mr. Bunting has just refused an offer of $1000 for.

Much more could be written about this herd that would serve as an inspiration to beginners, but enough has been cited to indicate that when one starts with good foundation stock, and cares for it properly, that the pure bred live stock business can be made very attractive. There are many more opportunities in California for men who will enter the business along sound and proven lines.

Bunting has accomplished more than other men we could name, and what Bunting has done can be done by others.

Bunting calls his herd the Mission Herefords, partly because it is located near Mission San Jose, but largely because the herd has a mission—to be recognized as a source of good cattle.

SALE OF A GREAT PROPERTY

Sale of 160 acres of valuable lands in one of the best producing sections of the San Joaquin Valley offers an opportunity for farmers in this state who may wish to increase their possibilities for profit. The Whitten Ranch, which has been called "The Pride of Tulare County," contains 160 acres of richest soil, 100 acres of which are already in alfalfa, with wells to furnish water for irrigation and fully equipped for the production of hogs for profit. With the selection of producing breeds and the giving of business management to this ranch there is no reason why it should not become a great money maker. It is offered at terms covering a period of 10 years and at public auction next Thursday, February 27. In addition there will be sold a large number of draft horses, pure bred and grade, sheep, cattle, Poland-Chinas and Durocs. Rhoades & Rhoades are the auctioneers.

HOLSTEIN BREEDERS SET NEW MARK

A new high mark has been set by the Holstein breeders of the Pacific Coast in the entries for the Guaranty Sale to be held at State Fair Grounds, Sacramento, on March 27. The highest record cow ever sold on the Pacific Coast is found in Boweda, the great 37 pound cow in the Brigford Company entries. The same company also contributes the highest record bull ever sold in the West, a son of the latest 41 pound cow Adirondac Wietske Dairy Maid.

A. W. Morris & Sons contribute among others some fine daughters of Prince Gelsche Walker, bred to the only bull whose seven nearest dams average over 1000 pounds butter in one year, and they also sell a wonderfully fine son of the 34 pound junior four year old Lady Hiske Walker, sired by Sir Aaggie De Kol Acme.

McAlister & Son sell a truly wonderful group of daughters and sons of It out of 29 to 35 pound daughters of King Segis Pontiac and King of the Pontiacs. Their consignment also includes a splendid 31 pound cow and a remarkable granddaughter of Rag Apple Korndyke 8th.

W. J. Higdon sells some choice ones, including a great heifer bred to the $6500 bull King Korndyke Pontiac 20th.

Alex Whaley, Tulare, says the committee of selection took the best animal that has ever been sold out of the Eldorado herd, and she is certainly a little beauty.

R. F. Guerin contributes two fine heifers, both by a 30 pound son of Sir Veeman Hengerveld, one out of a 30 pound dam, and both bred to his 35 pound bull King Sadie Vale Idyl Segis.

Other California breeders are contributing equally noteworthy individuals, which will be mentioned later, and the beautiful group of cows and heifers contributed by Albert E. Smith, Hollywood Farm, and Carnation Stock Farm, all of the state of Washington, are of such quality that they would command instant appreciation in any sale ring in the world. Many of these are bred to the great Judge Segis and to the world famous $106,000 bull Carnation King Sylvia.

L. M. Fleming, farming for Guy Attaway of Mesa, Arizona, produced this year on a 50 acre field 60 bales of cotton. Ten acres of the field which was poorer than the rest was planted two rows of cotton and then a row skipped leaving a space seven feet wide between each two rows. The 10th of June the space between the two rows was planted to Crowder cow peas inoculated with a special bacteria, 150 pounds of seed being used to the 10 acres. About the 20th of July when the pods were beginning to form the vines were cut into the soil with a single row disk cultivator. The yield on this field was 1½ bales per acre.

Your Little Pigs Well Started are Half Raised

LET ECONOMY STOCK POWDER HELP YOU

This is a boiled-down personal talk between ourselves about raising and sending more hogs to market in less time, in better shape, for more money.

Of course you ought to have good individuals to start on—the best you can buy. You can't be too careful in selecting your herd boars and brood sows if you're looking to breed to a quick-maturing, strong, easy-feeding type. Then, too, you should have everything fitted for the comfort of the animal. Give your brood sows good, warm sleeping quarters, with plenty of room to exercise. Take special pains with their feed. Give them only those foods that will supply the nutriments they need for themselves and for nourishing their young. Keep your hog houses thoroughly disinfected, well ventilated, light, dry and warm, and your hogs free from lice, scurf, mange, etc.

Brood sows, being naturally feverish, should be kept in good condition—their stomachs sweet, liver and kidneys regulated, their fever kept down to prevent constipation. See to it that your brood sows are in good condition before farrowing. Don't give your sows any feed whatever from 24 to 36 hours after the pigs are born. She has enough milk, and all that is necessary is plenty of warm water—nothing else. After that start her lightly on feed.

Give your young pigs plenty of exercise. Keep them warm. See that they get lots of sunlight and be sure to keep them dry the first two or three weeks. Watch your pigs and sort out the ones that are not doing well and put them in a pen by themselves. If they have a rough coat of hair, heavy paunch or belly, watery or gummy eyes, they are probably wormy.

Our Powder will keep your pigs in condition by acting on the liver, kidneys and blood. Keep the stomach sweet. Acts as a general cleaner of the system—expels the worms, aids digestion, purifies the blood, keeps the bowels loose and active, prevents scours, thumps and all other ailments.

Short Courses in Beekeeping

By Geo. A. Coleman

IN NOVEMBER and December, 1918, the extension department of agriculture, University of California, in cooperation with the United States department of agriculture inaugurated a series of short courses in beekeeping designed especially for commercial honey producers. The plan was to have a course of one week's duration at each of the following places: San Diego, November 25-30; the University Farm, Davis, December 2-7; Visalia, December 9-14, and Riverside, December 16-21. This plan was carried out with the exception of the Riverside course which unfortunately had to be given up on account of the influnza ban which was on during the time for which the meeting was scheduled.

Short courses in beekeeping of a week or more in length have been given before at various colleges in the United States. This series of courses in California, however was planned with the needs of the large commercial honey producers in view rather than for the beginner. While they were undertaken with some misgiving on the part of the staff of instructors and the extension service, as to how they would be received by the beekeepers, the results have far exceeded their expectation both in attendance and the interest taken by those present.

Fortunately at San Diego the influenza ban was lifted just long enough for the week of the course which was given in the Auditorium of the San Diego state normal school. Considering the circumstances the attendance of 135 beekeepers at this course and the fact that they stayed throughout the entire week, even Thanksgiving Day, and on the day of the great aviation demonstration, giving the closest attention to the lectures and demonstrations from 9 a. m. to 5 p. m. and attending a lecture every evening from 7-9, we feel amply repaid for the effort and consider that the courses were an unqualified success.

The attendance and enthusiasm of both the commercial honey producers and beginners at the University Farm at Davis were fully up to that at San Diego. Here the amateurs were more in evidence than the professionals and were a source of some embarrassment to the staff of instructors, as they had not made provision on the program for such a contingency. However, both amateurs and staff rose to the occasion and solved the problem to their mutual satisfaction.

The influenza ban was also on at Visalia but notwithstanding that and bad weather conditions about 60 of the largest honey producers, many of whom operate from 500 to 2000 colonies, braved the dangers and although having to endure the discomforts of the masks and an uncomfortable meeting place, they stuck it out to the end with unbounded enthusiasm.

The entire staff of instructors were bitterly disappointed on receiving word from the farm advisor at Riverside that the county health officer stated that the course could not be given even at the experiment station where it was planned to give it in case conditions prevented meeting in the city of Riverside. However, there was nothing to do but call it off and it was with great regret that the hundreds of beekeepers, some of whom had come from San Luis Obispo and further up the coast, had to be turned away.

The course being planned for beekeepers of considerable experience, it was assumed that they were already familiar with the construction of hives, styles of frames and the various equipment used in the apiary, and the time therefore could be given to a consideration of the activities of bees in the colony which can only be thoroughly understood by a thorough study by scientifically trained men. This part of the course was therefore planned and given by Dr. E. F. Phillips, apiculturist of the United States department of agriculture, whose extended study of bee behavior and experiments carried on in the apiaries of the United States department on such subjects as "the temperature of the hive" and "wintering conditions," "winter protection", etc. enabled him to give to the beekeepers first hand information on these subjects, of great value.

The practical application of the results of their experiments and also much valuable and practical instruction was given by Geo. S. Demuth, first assistant apiculturist in the United States Department, and a practical beekeeper of long experience. His work as a member of the staff supplemented that of Dr. Phillips very nicely and working together they were able to develop the subjects and make the practical application which appealed to all those present as the best instruction they had ever received.

To George A. Coleman, in charge of apiculture at the college of agriculture, University of California, were assigned the subjects "Parthenogenesis in Relation to Practical Beekeeping" and "Undeveloped Territory in California", in addition to having general charge of the courses. Although Mr. Coleman was able to appear only at San Diego and at Visalia on account of contracting a bad case of the influenza much interest was manifested in the first of these subjects and its practical application to the breeding of better queens and the matter of keeping records of the performance of all breeding stocks as a basis of selection and improvement of breeding queens and in the idea of every beekeeper becoming his own queen breeder, to some extent at least, as it is impossible for the present professional queen breeders to supply the demand for queens.

The beekeepers were also greatly interested in the development of beekeeping in the national forests of California which offer a great field for the development of extensive out apiaries, and the use of our 5,000,000 acres of brushwood or "chaparral" as bee range which otherwise is of no value except in the conservation of the water supply.

Jay Smith, of Indiana, who is at present doing extension work under the United States department of agriculture in California, also assisted with the courses and gave several practical talks on queen rearing at which he is an expert, demonstrating particularly a new introduction cage, his own invention, by means of which many valuable queens have been introduced with perfect safety.

M. H. Mendleson of Ventura, one of the pioneer California beekeepers whose apiaries have a world wide reputation for their neatness and the perfect system pursued, was also a member of the staff and gave much practical information and valuable advice to beekeepers on their individual problems.

Frank C. Pellett, assistant editor of the American Bee Journal, gave an evening lecture at each place on "Inspection Laws", a subject on which he is well qualified to speak, having served five years as state inspector of Iowa. His ideas of a program of education to clear up the brood disease problem, rather than having it a police system, were enthusiastically endorsed by all the beekeepers present at every lecture.

E. R. Root, editor of "Gleanings" was also present and gave an interesting illustrated account of the development of beekeeping in the United States and related many anecodotes of the pioneers, among whom were such men as Langstroth, Hedden, A. I. Root and many others.

A certain time each day, usually at the close of a lecture, was set aside for the presentation of questions from any beekeeper present. This generally brought forth a good discussion in which the beekeepers took part and much valuable information was brought to light in this way.

It was planned to have a "get acquainted" dinner at each place. The influenza ban however, prevented the carrying out of this part of the program except at San Diego where a very enjoyable evening was spent around the banquet table at the Hotel San Diego, after which we listened to a most interesting account of educational work in beekeeping by Dr. Demuth.

The success of these short courses has led to the adoption of a similar course by New York which is just being held at Cornell University, Ithaca, New York during the week of Febru-

ary 24 to March 1. We are glad to know that we started something with these courses and to state also that they will be continued next fall, and perhaps extended to include one or two more places in the state and that it is planned to offer a short course particularly for the benefit of beginners and amateurs at the agricultural college at Berkeley, full announcement of which will be made later.

ARIZONA BEE NOTES

I now run for extracted honey only, use a low wheeled wagon with honey house screened in on it, which I move from yard to yard with team, as some of our roads would hardly permit of a heavy truck, although I use a small yard truck for everything else. I use a reversible honey extractor run by gasoline engine which also runs a large fan, same as an electric fan only much larger, which keeps the room always cool.

The uncapping box has a false bottom filled with water heated by two gasoline burners. The cappings drop onto a screen platform where the honey drains through and passes out through a faucet going to the tank through strainer with honey from the extractor. The dry cappings are shoved off from the platform on to the heated false bottoms where it melts and the dark honey is drawn off and kept to feed to weak colonies in winter and spring. A coil pipe under the capping box connects with a small steam tank by a rubber tube and a hollow uncapping knife keeping it constantly hot.

Nearly all of our writers for Eastern bee journals are northern men, hence I have greatly changed my methods, adapting them to outdoor wintering and a different honey flow. While the Northern and Eastern honey flow only excites swarming, here in Southern Arizona a good honey flow stops swarming.

I frequently send away for the best stock of queens and then breed from the best. If the bees were properly looked after last fall and given plenty of honey or thick sugar syrup, all cracks except the entrance stopped up, they should winter in the Southwest.

Watch in front for signs of skunks or other wild animals which scratch at the entrance to make the bees come out and greatly weaken or destroy colonies. See that all grass and brush near-by is cleared away to avoid fire.

If in low altitudes have the bees under sheds running east and west to keep the combs from melting during hot weather. See that they are within a quarter of a mile of water as 100 colonies will need five gallons daily in dry hot weather.

Get your hives and other supplies ready now.—B. A. Hadsell.

Book Review

THE FARMER HIS OWN BUILDER

"The Farmer His Own Builder" is a guide and reference book for construction of dwellings, barns and other buildings, by H. Armstrong Roberts, and published by McKay, 608 South Washington Square, Philadelphia, Pennsylvania, $1.25.

"A good farm is worth good buildings," is the opening statement in this book of practical hints on farm building construction. Unfortunately all of the plans and specifications are made from experiences in countries which have different conditions from those which obtain in California. There are particulars as to ventilation and the arrangement of ventilators and methods of building which are much more substantial than are often required under California climatic conditions. Notwithstanding that there are many hints and suggestions, and the discussions of general principles are such that the book is of value to the Pacific Coast farmer. The book is profusely illustrated, mostly with drawings and occasional halftones or plates of successful and convenient buildings on Eastern farms. There are 16 chapters discussing preparation of plans and specifications and taking of bids; figuring the materials; staking out and building foundations; facts for concrete construction; framing the skeleton; roof — its shape, framework and covering; sanitation; concrete posts, troughs, etc.; work bench and tools in the farm shop; ropes and pulleys, etc. The appendix is make up of a number of very valuable tables.

American Farmers and the League of Nations

By Gifford Pinchot

Farmers think easily in terms of world trade. The largest item in international exchange consists of products from the farm. It has been well said that food is the other side of every international transaction. Wheat, cotton, and wool are the most world wide materials of exchange. Of all men the farmer, therefore, is most concerned with that world commerce in the raw materials of food and clothing which, more than all else, draws the nations together.

It is well to remember that the most continuously active international organization in the world deals directly and only with the products of the farm,—the International Agricultural Institute at Rome, founded by the prophetic vision and unquenchable faith of an American, David Lubin of California.

As yet no one can discuss with authority the interest of American farmers in the League of Nations. The National Board of Farm Organizations, through which the organized farmers of America speak, has not yet made its position known. I have however, presented the views which follow to as typical a body of 150 American farmers as can be found in America. This body stamped them as correct. Furthermore, what the American farmers thought about the war will help to show what they are thinking about the League of Nations and the Peace.

Living nearer to the earth than any other men, the farmers deal more closely with realities. Of all our people they are the most apt to be right in the long run, and least likely to take the shadow for the substance.

The farmers of America, under every sort of handicap, raised the vast crops without which the war could not have been won and gave to our armies a million fighting men. Yet with the direction of the war they were allowed to have nothing to do. They will not consent to be excluded from their rightful share in the direction of the peace, and of the vast international issues which must grow into settlement afterward.

Slow to get into the war, once in our farmers were there to see it through. Few of them were deceived by the talk, so common a few months back, that Germany could never be beaten, and that the time had come to compromise. There was no compromise about them.

The proposal to let the Germans off easy appeals to them little. The damage has been done, the loss endured. It is clear that if the guilty do not pay, the innocent must. And since Germany is to pay the bill the farmers of America will agree that she must be allowed to earn the money, and that the only way to earn it lies in foreign trade. But there must be restrictions strong enough to prevent her from ever being able to win by trade what she lost in war.

Farmers were not carried away by the Russian formula of no annexations and no indemnities. The self-determination of peoples as an easy and certain cure for the world's troubles leaves them equally cold. They do not forget that the fathers of numberless American farmers fought and died to prevent the principle of self-determination from destroying our nation.

The farmers are for peace, for a permanent peace, a peace fitted to the conditions of the world in which we live, and not a peace adjusted to the dreams of dreamers who are not responsible for making their dreams come true. They will welcome a just peace, with reparation to the injured and punishment for the guilty, but they do not want to see generosity take the place of security and justice. They want this war to be the last. When peace is made they want it to

International Motor Trucks
For Country Road Hauling

OF ALL the motor trucks offered for farmers' use, the **International** should be, and we believe is, the most satisfactory.

This Company knows the country — roads, farms, and all. Farmers know our standards of quality and service. When we offer a motor truck for farmers' use, it is understood that the truck will do the work expected of it at a cost farmers can afford.

The **International Motor Truck** is built for carrying capacity loads on country roads. It gives satisfactory everyday service, the kind that farmers must have. When an emergency comes — a tough piece of road, a steep hill, a rush trip, a bad day — the **International** has the reserve power, speed, and endurance to carry it through.

Mr. L. C. Henry of Utica, Minn., purchased an International Motor Truck to haul his live stock and farm produce to market and to bring return loads from town. He says, "We use the truck for nearly every kind of hauling. It saves more time than any other machine in our farm service." Five of Mr. Henry's neighbors bought International Motor Trucks when they learned, from his experience, what a useful economical farm machine he had.

There are four sizes of **International Motor Trucks** — 1,500, 2,000, 3,000 and 4,000 pounds capacity, with bodies suitable for every kind of hauling. We have a dealer, a branch house, or a service station somewhere near you, where the line can be seen, or we will send full information promptly if you will write us.

HOGS

THIS IS TO ANNOUNCE OUR

FIRST ANNUAL FARM SALE

To be held in the town of BUTTE CITY, Glenn County, California, at 1 P. M., SATURDAY, MARCH 1, 1919. We will sell 20 Registered Shorthorns, 30 Registered Berkshires, 20 Registered Shropshires, and 15 Ponies. This sale is primarily to advertise the ranch. We do not expect high prices, but we know that every animal we sell will make a market for more in the future. It will be a buyer's opportunity. All stock of very best breeding. COL. W. H. HORD will conduct the sale. Butte City is 16 miles southeast of Willows; 25 miles southwest of Chico; 19 miles north of Colusa; 80 miles north of Sacramento.

BUTTE CITY RANCH.

W. P. DWYER and W. S. GUILFORD, Owners.

"Billiken" Chester Whites. Practically sold out. One yearling boar, one bred yearling gilt, due to farrow in April, and five fall boar pigs are all I have now for sale. Sows are bred for March and early April farrows. I have recently added some new blood lines in the way of bred sows. My stock is the best obtainable and there is none better in the West. Will book a limited number of orders for weaned pigs, spring farrow, to be shipped at weaning time. C. B. Cunningham, Mills, Sacramento County, California.

O. I. C. BREEDER'S NOTICE
I will sell (Ohio Boy) two year old imported boar, none better. Also boar pigs ready for spring breeding, sire (Ohio Boy), dam (Toddler's Beauty Imported). Write for full information. Jas. Little, Wasco, California.

For Cheap Hog Feed plant JERUSALEM ARTICHOKES; cheaper than alfalfa, and a winter feed. Tubers $5.00 per 100 lbs.; 1000 lbs. and over 3½c per lb. CALIFORNIA NURSERY COMPANY, Niles, California.

Bargains in Poland China Sows. All immune. Good mothers and prolific. Registered stuff. Also boars. Write for details. N. C. Hansen, Coachella, California.

At Service—D's Wonder, the large type Poland China boar. Sows called for, fed and delivered. M. Hayward, 4 blocks east of P. O., Hawthorne, California.

FOR SALE: REGISTERED POLAND-CHINA BOARS. J. R. CARHART, FULLERTON, CALIFORNIA.

REGISTERED BERKSHIRES. FAIR OAKS RANCH, WILLITS, CALIF.

BIG TYPE POLANDS
W. H. BROWNING, WOODLAND, CAL.

HOGS

Castleview Giant Type Berkshires are the thrifty, typey, quick-growing kind that will make larger profits for you. Prizes and Championship honors are awarded—by the greatest judges in America—only to animals possessing the essential qualities for economical meat production, viz.: heavy bone, good feet, broad strong backs, large hams and easy feeding qualities. Our grand champion herd includes Riverby Princess, grand champion sow of the world; Rookwood Lady 100th, 1917 grand champion of America; Mayfield Laurel 15th, 1917 grand champion of California. Bred sows, bred gilts and fine weaned pigs for sale.
Castleview Ranch, Santa Rosa, Cal.

BERKSHIRES BERKSHIRES

CALUMET BAKING POWDER SAVES THREE WAYS

—A moderate priced baking Powder of greatest merit. Honestly made. Honestly sold. A full money's worth.

—You save time when you use it. Begins to raise bakings the instant they are put into the oven. You don't have to keep "peeping" to see if bakings are all right. Calumet is *sure*—never fails. That's true economy—in cost—in use—in time.

—The unfailing strength of Calumet guarantees perfect results. Not only saves flour—sugar—eggs, etc.—but saves Baking Powder. You use only a teaspoonful—you use two teaspoonfuls or more of most other brands.

Calumet contains only such ingredients as have been approved officially by the U. S. Food Authorities. The Army and Navy use it.

IF—

If you can keep your head when all about you
Are losing theirs and blaming it on you;
If you can trust yourself when all men doubt you,
But make allowance for their doubting too:
If you can wait and not be tired by waiting,
Or being lied about, don't deal in lies,
Or being hated don't give way to hating,
And yet don't look too good, nor talk too wise;

If you can dream—and not make dreams your master;
If you can think — and not make thoughts your aim,
If you can meet with Triumph and Disaster
And treat those two imposters just the same;
If you can bear to hear the truth you've spoken
Twisted by knaves to make a trap for fools,
Or watch the things you gave your life to, broken,
And stoop and build 'em up with worn-out tools;

If you can make one heap of all your winings
And risk it on one turn of pitch-and-toss,
And lose, and start again at your beginnings
And never breathe a word about your loss:
If you can force your heart and nerve and sinew
To serve your turn long after they are gone,
And so hold on when there is nothing in you
Except the Will which says to them: "Hold on!"

If you can talk with crowds and keep your virtue,
Or walk with Kings—nor lose the common touch,
If neither foes nor loving friends can hurt you,
If all men count with you, but none too much:
If you can fill the unforgiving minute:
With sixty seconds' worth of distance run,
Yours is the earth and everything that's in it,
And—which is more—you'll be a Man, my son!

—Rudyard Kipling.

GEORGE WASHINGTON AS A BOY

OUR first great general, our first president, our first citizen, "First in war, first in peace, first in the hearts of his countrymen," was born 187 years ago today. In 1775 he became commander in chief of the armies of the American colonies, finishing the Revolutonary War victoriously at Yorktown in October, 1781. In 1789 he became the first president of the United States.

He has left to us, as his countrymen, a heritage of untarnished honor, of greatness in heart, in mind and in soul, which is wonderfully portrayed in the noble painting by Stuart, reproduced on this page.

Kipling's poem, "If," was inspired by his study of the life and character of Washington and prefaces his story, "Brother Squaretoes" wherein is presented an unforgettable picture of our first president.

The following account of his boyhood appeared in the Youth's Companion of February 15, 1917:

We so commonly think of Washington in connection with Mount Vernon that we are likely to forget that his birth did not occur at Mount Vernon, and that his earliest years were not passed there. He was born on his father's plantation at Wakefield, on the Potomac River, about 50 miles below Mount Vernon. The plantation had been in the family for many years, but three years after the birth of George the family left it, because it was unhealthful, and moved up the river to the plantation that was later known as Mount Vernon. There the family lived for the next five years, and then for three years—until the death of Augustine Washington, the father of George, in Stafford County, on the east bank of the Rappahannock, opposite Fredericksburg.

George was 11 years old when his father died, and for the next few years he lived a part of the time with his older brothers and a part of the time with his mother. His brother Lawrence inherited the large estate at Mount Vernon. About ten years later, when Lawrence and his daughter had died, the estate fell to George himself. Another brother, Augustine, inherited the plantation at Wakefield, and soon after his father's death George went back there to live for a time in the house where he was born. Not many years later that house burned, and the Wakefield plantation went to decay.

"George" was not a common name in the Washington family; it has been thought probable that George Washington was named for George II, who was on the throne of England when he was born, and who was the father of the king that he fought in the Revolution.

As a boy George was large and strong for his years. In the sports and contests of the day, especially in running, jumping and wrestling, he rarely met his match among the boys of his age. He was rather more shy and serious than most of his companions, and was eager alike for study and for outdoor sports. His father had sent the older brothers to England for their education, and probably George would have gone there too, had his father lived. As it was, he attended, until he was 15, such schools as there were in Virginia at that time—private schools taught by a man, often a clergyman.

George was very fond of horses and found much happiness in the thirty that were in the stables at Wakefield, when he went there to live with his brother, Augustine. On most of his early rides a faithful old negro named Peter was his companion. Another negro named Sampson, who had a wonderful control over horses and other animals, taught him much of the horsemanship of which he was a master all his life.

One morning when he was nearly 12 years old he took one of the best horses in the stables and rode away to a fox hunt without asking permission. He was so much younger than the other members of the hunting party that they laughed at him; but he stayed in the saddle through it all and saw the two foxes killed. About noon his horse went lame, and he had to dismount and lead the animal home. When he reached the stable he found the plantation overseer very angry and about to punish the negro who had allowed the horse to be taken away. He snatched the whip from the overseer's hand and stoutly insisted that if anyone was to be punished it should be he. That incident was only one of the many that made the negroes on the plantation, old and young, devoted to him. He did not approve of the system of slavery, and in later years provided for the freedom of all the slaves on his great estate. One of the last acts of his life was to visit a servant who was sick.

The life of a Virginia plantation gave no end of opportunities for a boy to enjoy himself. He went hunting at daylight for wild ducks and geese. In April and May he caught shad in the Potomac, and he gathered crabs, oysters and clams from the waters of Popes Creek. On moonlight autumn nights he went coon hunting and joined in the corn-roast frolics at the cabins of the field slaves. He rowed and sailed much on the Potomac, which was the main highway for the visiting back and forth among the families of gentry whose big plantations bordered its banks.

It was the unfailing custom to go to church on Sunday. Many families came long distances and brought their luncheons, so that between the services there was a sort of picnic, very pleasant to the young people, in the oak grove near the church. The passing of many years did not weaken the churchgoing habit of that youthful period.

So George lived, a part of the time with one brother at Wakefield, a part with another at Mount Vernon, and a part with his mother on the shores of the Rappahannock. When he was 14 years old he planned to go to sea—or, rather, his brothers planned for him. He had his chest packed

"If a star were quenched on high
For ages, would the light,
Still traveling from the sky,
Shine on our mortal sight,
So when a good man dies
For years beyond our ken
The light he leaves behind him lies
Along the paths of men."

and was actually on board a ship in the Potomac; but his mother prevailed on him to give up the plan. It was a great disappointment to him, for which his beloved horses and dogs hardly consoled him; but then, as all through his life, he faithfully kept his promise to his father that he would always be good to his mother.

It was his liking for surveying, first developed by study of the little handbook, the Youth's Compainion, that led him to become a surveyor by profession. He was only 16 years old when he set out to survey lands owned by his friend, Lord Fairfax, in the western part of Virginia. That work in the wilderness led him into experiences and adventures that had a great influence on his later life as a soldier, and consequently much influence on the whole course of American history.

In his boyhood George Washington showed the qualities that made him one of the greatest men of all time. Many boys of that period, living on large plantations where negroes did all the work, would have chosen a life of idle ease, or would have given their energies mainly to sport, instead of seeking employment as a surveyor; but he did not feel that it was beneath his station to work hard, far from the luxuries and comforts of a good home, and to earn wages like a day laborer. He was a wholesome and manly boy in all his relations—courteous, truthful, modest, brave in the face of dangers and difficulties, thoughtful of others, faithful to every trust in school or work or play, and earnest in his determination to master a quick temper that once in a while blazed forth.

Every American boy should read the life of George Washington — boyhood, manhood and all. It is one of the most interesting stories ever written; every page has things that are helpful and inspiring.

Push may be better than a pull, but a lead is always better than a drive.

NAGGING

Nagging is one of the most irritating expressions of spitefulness. A part of its dangerousness is in the fact that one may indulge it somewhat unconsciously, use it without knowing it is "loaded." A spirit soured to a certain degree emits acid criticism as freely as a spoiled fish spreads its odor. The habitual nagger becomes so expert as to make each reply a retort and hot enough to burn; always able to find the open joint in the other's armor of innocence and make the prick smart the worse because unexpected. No house cat is so meek as to endure patiently for very long having the fur rubbed wrong.

One may innocently begin the practice as a play of keen wit which has a little sting in ts point.

When criticism putrifies it becomes nagging and it imparts its flavor to its victim. It takes a super angel to keep sweet under nagging. Any man who nags his wife deserves a dose of German kultur. Any woman who nags her husband ought to be married to the conscience of the ex-kaiser. If you don't know that you are a nagger watch the temper of the one where your conversation lands. If the symptoms turn black add honey to your speech or prepare for divorce proceedings.—Sunmaid Standard.

CONSERVATION

Written for California Cultivator
By Mrs. C. F. Casey

A helpful thing to do is to review one's expenditures and carefully segregate the luxuries from necessities, and an awful lot of things can be placed under the heading of luxury.

If an allowance is estimated for food, clothing, amusements (including reading matter) light, fuel and phone, and a tin box is kept for each separate fund and surplus banked at the end of each month with a credit for each in another box (paste the cover to this bank so it can not be opened unless absolutely necessary) it will be an incentive to see which bank will yield most coins in six months.

As for food, it's a sort of triumph over conditions if one can show a credit balance at end of the month on a small allowance. An inducement to study government bulletins and know how to make a ten cent lamb stew into a delicacy, and make rice au gratin, at a cost of about ten cents for a family of six, seem like a feast for the gods, also to plant a little garden.

As for clothes, how we all admire the soldiers in their uniforms. They always look well dressed for their clothes are of good material and are always clean. Not so many changes are needed if material is good and clothes well cared for, and instead of trying to make a stylish hat out of an old last summer dress, try running all the heels of new stockings with a slender silk thread, stitch a band of tape at top to prevent runs, and put a patch in the seat of Johnny's new pants so they will wear twice as long. Be careful that gas is not left burning when not needed, that lights are not left burning in rooms not in use, that there are no dripping faucets, and there may be a few extra pennies in this bank. One can often arrange to share a magazine subscription with a neighbor, and if you are in doubt about enough being saved to purchase Christmas gifts, try slipping a plant, or buying now a ten cent one from the nursery and keeping it growing for your best friend. It will be appreciated.

Martha Washington's will which was in the possession of J. P. Morgan, Sr., for several years, is now in the custody of Judge James Keith of the Virginia supreme court of appeals, to whom it was sent by the present head of the Morgan family with directions to make such further disposition of the relic as might be pleasing to the state of Virginia. This will terminate the suit begun in the federal supreme court for possession of the instrument. The will was taken from the Fairfax court house in 1862 by a colonel of the Union army, who rescued it from a bundle of papers about to be thrown into a fire. He kept it for 30 years and then gave it to his daughter, who, in 1905, sold it to the father of the present J. P. Morgan.

He hasn't forgotten-

No need to tie a string 'round *his* finger to remind him of Ghirardelli's Ground Chocolate—for that's *one* good thing he never forgets.

Nothing more delicious or more nutritious! And nothing quite so handy! A hundred uses in every can—always keep a can on hand!

A Schmeiser Leveler

of the "Giant" Type

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

YOU SHOULD
send for our LATEST catalog J-600 which is full of interesting information on LABOR SAVING DEVICES and machines for moving the earth.

Schmeiser Manufacturing Company

22 Mechanic St. Davis, Cal.

Manufacturers of

Sure Pop Almond Hullers and Separators, 3 sizes; McGarvin Fruit and Olive Graders, any size; Schandoney & Harrington Equalizing Hitches, any size; Diamond Special Harrows, Baker Clips, Clevises, and Schmeiser Portable Automatic Hay Derrick. We sell the Martin Ditcher and Grader.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

LIVE STOCK

The receipts of beef cattle have been very moderate. Prices on the better grades of both steers and cows are holding firm at last week's figures. Medium and common grades are fully steady.

Hogs continue to arrive in liberal quantities but no improvement in the outlet for dressed pork is noticeable. There seems to be a very poor demand for all dressed pork products.

Lambs of good quality and handyweight are steady while other grades show an undertone of weakness. Sheep are not easily sold as the market for them, especially ewes, is very dull and draggy.

Prices paid for steers and cows are fully steady. Hogs are weak excepting for best grades. Lambs are steady. Mutton is weak.

Following are the live stock prices Tuesday in Los Angeles, f. o. b. packers' yards. Prices at country points are $1.00 to $1.50 per hundredweight less than those quoted:

Good steers .....13.50@14.50
Medium steers .....11.00@12.50
Common steers .....9.00@10.00
Good cows .....10.50@11.50
Medium cows .....8.50@9.50
Common cows .....6.00@7.50
Hogs No. 1 175-225 lb. .....16.00@16.50
Hogs No. 2 225-400 lb. .....14.50@15.50
Lambs No. 1 65-80 lb. .....16.00@16.50
Wethers No. 1 .....11.00@12.00
Ewes .....8.50@10.50

Contagious Abortion

Don't sell the aborters. Clean out the infection. Breeding animals are worth more than ever before. Control of Abortion is doubly necessary.

The Abortion infection causes Barrenness, Retention of Afterbirth and Calf Scours in addition to Abortion. Unless checked it is likely to run through your entire herd.

B-K is a powerful non-poisonous antiseptic —scientifically correct for this work. Used as a douche, it dissolves the slimy albuminous matter in the vagina and uterus, kills the germs, stops discharges and controls the infection. B-K is much more effective than lysol, carbolic acid, Lugol's solution, bichloride of mercury and coal tar disinfectants, all of which tend to coagulate or thicken the albumins.

Contagious Abortion is being successfully controlled in many herds by following our simple plan with B-K. Send for "evidence."

FREE BULLETINS: Send for our valuable bulletin No. 52 on "Contagious Abortion," also "145 Farm Uses" and our "Trial Offer." If your dealer does not have B-K send us his name.

IMPLEMENT ASSOCIATION ANNUAL

The California Tractor and Implement Association holds its annual election of officers and hears reports from retiring officers at its regular meeting which is to be held in the Palace Hotel, Saturday of this week. The condition of the treasury, which shows a balance of something over $3000, indicates that the association is in a strong position and ready for its great spring demonstration which will be held within the next few months. Last year's demonstration was surely a great one.

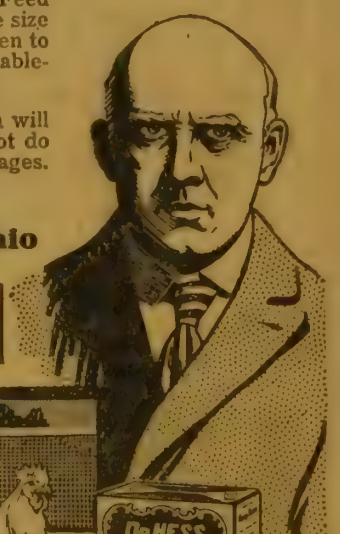
MAKE YOUR HENS LAY NOW

YOU want eggs to sell at these war-time prices, and you want to do your full part toward increasing the world's food supply.

Speed up the laying. Get your hens in finest laying trim by feeding Dr. Hess Poultry Pan-a-ce-a. It helps to make poultry healthy—to make hens lay—to make chicks grow.



DR. HESS POULTRY PAN-A-CE-A

Mating time is here. Now's the time to put your hens and roosters in the pink of condition. If you want chicks that will live and develop rapidly, if you want early broilers, if you want pullets that will develop into early winter layers, then feed the parent stock Dr. Hess Poultry Pan-a-ce-a.

Remember, its the singing, scratching, industrious hen that lays the healthy, fertile eggs that will hatch into strong, livable chicks. Feed Pan-a-ce-a for results. Buy according to the size of your flock—a penny's worth for every hen to start with. A good rule for feeding is a tablespoonful once a day for every 20 to 25 hens.

The dealer from whom you buy Pan-a-ce-a will return every cent you pay him if it does not do what is claimed. 30c, 60c and $1.25 packages. 25-lb. pail, $3.50; 100-lb. drum, $12.00.

The Rooster and His Harem

Written for California Cultivator By Jean A. Koethen

SOMETIMES it seems to me that I have told all I know about chickens at least 2317 times, and that there cannot possibly be anything left to say. When such times come I am very glad to have some reader of the Cultivator come along and give me a hard jolt, like that in the following letter, reminding me that however many times I may have said this or that, there is always somebody who did not read or did not see or forgot. Besides, there is always the chance that the thing has not been said so many times as I imagine.

The writer of the letter, a Fresno woman, says: "I have 50 good, pure R. I. Red hens and pullets, but no rooster. I sold a splendid one about two months ago because he was related. By buying another one soon and penning him with my dozen best hens, could I expect a good proportion of fertile eggs? How soon after mating him would they be fertile? About what proportion of fertility could I expect? Is there any way of ascertaining fertility before setting? Would it pay me better to buy my hatching eggs? Do poultry breeders guarantee their hatching eggs fertile? Is there any difficulty found in keeping a flock of this many hens at home and about their business without a cock on the place?"

To put the last question first, after the fashion of a romantic girl reading the latest novel, what is the use of a rooster, anyway? Is he useful or ornamental or neither or both? Ornamental, he certainly is, if he is a good, pure bred bird; useful if eggs are to be fertilized, but only then. On many commercial egg farms nowadays one sees no cock at all. The owners of these farms prefer to buy their baby chicks ready hatched rather than feed and house male birds that are useful for only a couple of months in the year and expensive boarders the rest of the time. Hens lay just as many eggs, and are quite as contented without a male companion. If they have one, they must pay his board. The slogan "Swat the rooster" has been heard the length and breadth of the country, and twentieth century poultry keepers sit down and count the cost carefully before they decide that they must keep a male.

The question whether or not it would be less expensive to buy hatching eggs than to buy and keep a rooster depends entirely on the number of chickens that are to be raised in a season. If the breed kept were White Leghorns instead of R. I. Reds, and they were to be kept for eggs only, I should say, buy your chicks. But it is not easy to buy R. I. Red chicks of known heavy laying ancestry, and if they can be bought at all they are expensive. To be sure, one may go to a hatchery and buy Reds but what do you know about them? If they do happen to be the daughters and sons of heavy layers, it is pure accident, for in most cases those who do the hatching know nothing of the pedigree of their chicks. Your pullets may be greatly inclined to broodiness or not. They may be vigorous or weaklings. They may come from a strain that begins to lay early, and they may not. A few breeders do advertise chicks that you can depend upon, but they must be ordered early, and the supply is limited and expensive. If only a dozen pullets are wanted, three settings of eggs at $3 per setting should be sufficient to supply that number, and buying the eggs would be cheaper than buying a rooster of the same quality. If 50 pullets are desired, it would probably be cheaper to buy the rooster.

But here another factor enters. This letter was dated January 28, and it was already February when it reached me. If a rooster had been bought immediately, it would not have been wise to begin saving hatching eggs before the middle of the month. Tests have shown that eggs may be fertile as early as four days after mating, but the probability that all the hens in the pen would be laying fertile eggs within a week after mating is small. The birds have to have a little time to get acquainted, when a strange male is put in the pen, and two weeks is usually allowed before fertility can be depended on. Under these circumstances, it would hardly be possible to get any chicks out before the middle of March, and this is late to begin hatching Reds. Those hatched in March wiuld be early enough to develop into all layers, but April is too late. A few early pullets hatched from eggs purchased from a reliable breeder of bred to lay Reds might easily be more profitable than a far larger number hatched in April and May.

But I wish my friend had told me more about the rooster that was sold because he was related. We are beginning to learn that relationship is not such a bad thing after all, provided it is the right kind of relationship. If the rooster was the brother of the twelve best hens to which he was to be mated, the mating would not have been a good one, though there would be little chance of his being full brother to all the hens. As a matter of fact, such matings, while they are not recommended, and are not suitable for line breeding, often do turn out well. I had such a case in my own flock last year. A fine, vigorous Light Brahma cockerel, for lack of other hens to mate him to, was mated to his sisters, and the offspring were if anything of better exhibition quality than the parents. A mating of this sort should never be repeated, but in an emergency it seems to do no harm.

If, on the other hand, the rooster was the son of one of the hens to which he was mated, and the others were her sisters, you would have the best possible mating, provided the hens were worth breeding from. The mating of son to mother or sire to daughter, intensifies the characteristics of the parent bird in the offspring. If your hen is an extra good layer, mating her son, who is half her blood, back to her, intensifies her characteristics in the offspring. In other words, since her son is half her blood, his daughters, when he is mated back to her, will be three-quarters her blood. This is the best way to start a heavy laying strain, and there is no danger of bad results from inbreeding if the male and female lines are kept separate and the males of one mated to the females of the other. But the start must be made with good birds and the best only used for breeders.

One of the greatest forward steps that have been made in poultry breeding in the last twenty years has been the general acceptance of the principles of line breeding, as they were laid down by that pioneer poultryman Isaac Felch. We have come to see that the only way to build up a strain for either exhibition or laying is to breed within the flock. It may be necessary to bring in new blood now and then, in the shape of a vigorous well bred male bird, but he should be selected with great care, and his pedigree known, otherwise the characteristics we have been aiming at will be lost. Indiscriminate outbreeding may increase vigor but it breaks down and scatters the qualities that are the result of years of breeding. This is the great argument against outcrossing but it is also an argument against indiscriminate mating within the breed. To give a concrete example: The first Buff Orpington hens I owned were unusually free from broodiness. Had I known enough then to breed within the flock, mating a son of the best of these hens, which was almost a non-sitter, to the six hens, I believe I could have bred up a strain of practically non-sitting Orpingtons. Instead of this, I went to a high priced fancier, and paid $25 for a bird that spoiled my strain forever. With the wisdom bought at such a price I am now mating two R. I. Reds that go broody but once in a season to the son of one of them in the hope of building up a strain of Reds that will be content to lay without asking to sit too often.

The question of fertility is a big one and I can only touch the high points here. If a vigorous male mated in spring to a dozen hens there ought to be good fertility, other things being equal, but because we cannot always be sure of these other things eight or ten hens are usually preferred to twelve. A very vigorous male can easily care for twelve hens, but one is never sure of the vigor unt

fertility has been tested. Even with eight hens in a breeding pen there is no certainly that the majority of the eggs will be fertile. Some hens never lay a fertile egg. The breeder who wants to know exactly what are the possibilities of a given pen hatches the eggs of each hen separately. This may be done by putting them under different hens or in different compartments in the incubator. Such a test sometimes brings out surprising facts. One hen in the pen may lay infertile eggs, another fertile eggs that do not hatch, and a third fertile eggs that do hatch. We never know till we have tested the different hens in this way what proportion of fertile eggs we may expect. There is absolutely no way of knowing whether or not eggs are fertile before incubation is begun, but the eggs should always be tested between the seventh and the tenth day, when the infertile eggs show clear before a light. All reliable breeders replace the clear eggs that are tested out if they are returned. Any other guarantee is impossible.

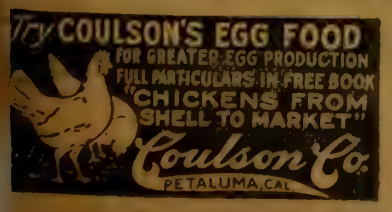
STOP THE CHINESE EGGS

Chinese eggs are coming into California by the shipload since the war ended, says J. H. Barber, general manager of the Poultry Producers of California. To cope with the situation immediate action must be taken by all poultrymen. Manager Barber sends out the following letter to members of the association and all other poultry raisers in the state, setting forth the conditions now confronting them and urging direct action:

It is highly important for all California poultrymen to consider carefully the matter of Chinese eggs. During the war there was an embargo on the importation which prevented Chinese eggs from coming here so that none have been received during the past two years. The embargo has now been lifted and it is understood that Chinese eggs are already on the way here; in fact, the writer has been informed that they are offered for sale at 40 cents a dozen f. o. b. San Francisco, to arrive within the next two or three weeks.

There is little doubt that they can be sold at a much lower price than this and it is quite probable that this competition will be used to break down the price of our California eggs during the coming storage season just as they were used in years past.

At the present time there is no tariff on Chinese eggs and it is probable that all we can ask therefore is that these eggs shall be sold strictly on their merits and just what they are under their own name. We are going to ask that much of the United States treasury department.



But the California poultryman will never have any effective protection against Chinese eggs, produced by Chinese cheap labor, until we again have a tariff on these eggs. We want every member of the association and every other California poultryman to write at once to his congressman and United States senator, calling their attention to this matter and asking them to work for a tariff on Chinese eggs sufficient to offset the difference between cost of production in China and cost of production here. It is surely not fair to expect American poultrymen to compete with the Chinese standard of living. A tariff of at least ten cents a dozen is necessary to give the needed protection.

Write to your congressman and United States senator at once, urging them to work for this tariff.

A company has been formed to build a cotton gin at Gilbert, Arizona.

Chickens Sick or Not Doing Well?

An Extraordinary Offer: Germozone is a standard remedy everywhere for chicken troubles, roup, colds, cholera, swelled head, bowel complaint, chicken pox, canker, not doing well, non-laying, etc. Now our proposition: If no dealer there handling Germozone and you will agree to use it and pay if satisfied, we will send you a 75c package without a cent in advance. No pay if not satisfied. Can we do more? And we will send free 5 poultry booklets. Write today.
Local dealers handling Germozone will do the same.
GEO. H. LEE CO., Dept. 418 OMAHA, NEB.

ALL-NORTHWEST EGG-LAYING CONTEST

The egg laying contest is a testing place for the poultry breeders of the state, and is also a testing place for those poultry raisers who want to improve their flock production. The contest, just closed, has clearly demonstrated that high egg production can be had from birds irrespective of altitude or other climatic conditions. The birds in the Second All Northwest Contest at the agricultural college at Pullman, Washington, came from places varying widely in all climatic conditions, as well as in available feeds. The high hen in the contest was a Single Comb White Leghorn, Number 251, which was bred, and is now owned by D. Tancred, of Washington. This bird laid 311 eggs during a period of 365 days. It is also a noteworthy fact that these birds made their records while kept in flocks of 36. The usual number of birds in other contests is from five to ten birds. It is more credit to a breeder to have a high record in a large flock than in a small one.

The high pen in the contest was a pen of White Leghorns, owned and bred by Paul B. Towne, of Washington. The five birds averaged 252.2 eggs per bird in the same length of time.

The second high bird was also a White Leghorn, Number 191, owned by J. R. McRea, Oregon. The third high hen was a Rhode Island White, Number 457, owned by H. J. Kingsbury, Idaho. These birds made records of 282 and 280 eggs, respectively. The second high pen of Barred Rocks, owned by the Oregon agricultural college, made a record of 1258 eggs, or an average of 251.6 eggs per bird. Rhode Island White pen Number 40, owned by F. W. Frederick, British Columbia, made a record of 1190 eggs, or 238 eggs per bird. The second high bird trapnested at the contest was a Rhode Island White, Number 588, alternate bird in F. W. Frederick's pen, which laid 291 eggs. Birds that have the breeding back of them can be taken from their own habitation without lessening their egg production, provided, of course, that the housing, feeding, and management of the birds are maintained along proper lines.

HATCH EARLY

Early hatched chicks almost invariable do better than late hatched chicks. They get a better start before hot weather sets in and are therefore less subject to disease and to fatal attacks from lice and other insects. As a result, a greater proportion of early hatched chicks are raised than is the case with late hatched chicks. As the matter of hatching and rearing pullets each year to replace a part of the hens in the flock which must be marketed is one of the most expensive and troublesome problems connected with poultry keeping, it is of the greatest economic importance that as great a portion of the chicks hatched be raised as possible. The greater the number of chicks raised from a given number of chicks hatched, the less is the cost per chick. Frequently the ability to hatch and rear chickens successfully means all the difference between profit and loss in the poultry business. Since early hatching has such an important bearing on the percentage of chicks raised, it is of the greatest importance and should by all means be practiced. The best time of year to hatch varies with the locality and climate. For information as to the most favorable time for hatching consult your county agent.

TO GET MORE EGGS

Do not overcrowd; do not keep the fowls in close, poorly ventilated buildings.

Do not keep immature or weak birds in the houses with the others.

Do not keep the fowls in houses that are infested with lice and mites.

Do not dope the fowls with concoctions that are said to make hens lay.

Egg producers of the Salt River Valley put into cold storage last year about 150 cases of eggs during the period of low prices. The results were so pleasing that about 1200 cases will be stored this season.

Yavapai County, Arizona, is to expend $3000 on a concrete apron or dip across the Santa Maria River.

The Pride of Petaluma

VENTILATING BROODER STOVE

Solves **VENTILATION**, gives about ten times more **WARM FRESH** air to chicks than any other brooder stove.
It's the only brooder stove with two **RADIATORS** hence compound **ECONOMY.**

It keeps chicks from crowding by proper application of heat, the only **SENSIBLE** way.

It's the only brooder stove using **CHEAP OIL TOPS** successfully as fuel.

It's **PETALUMA'S** latest sensation, and only brooder stove. It skins the bunch in **ECONOMY, Volume of VENTILATION** and **PROPER APPLICATION** of **HEAT. GUARANTEE—SIMPLY** send it back any time within 30 days' trial. If you don't think it beats anything you ever saw.
Get our catalogue No. 25. That's fair. **TRY IT.**

Helps Your Horses - Saves You Money

The horse is a vital factor in greater farm production. To realize the best results he must be kept one hundred per cent. fit.

STUFFED COLLAR PADS
Filled with our Special Composite Stuffing
are the only guarantee against bruised, galled and chafed shoulders. They are better than other kinds, being soft, springy and absorbent. They also make possible the continued use of a horse collar long after its worn condition would otherwise compel its discontinuance.

NEW PATENTED HOOK ATTACHMENT
(Found Only on Pads Made by Us)
Consists of wire staple with felt washer. It gives hook a firmer hold and prevents pulling off, even though fabric is weakened by long usage. Life of pad is thus materially lengthened. This is the greatest improvement since we invented the hook. Ask your dealer for Tapatco Booklet.

THIRTY-SEVEN YEARS MAKING PADS

THE ARNOTT ENGINE HARROW

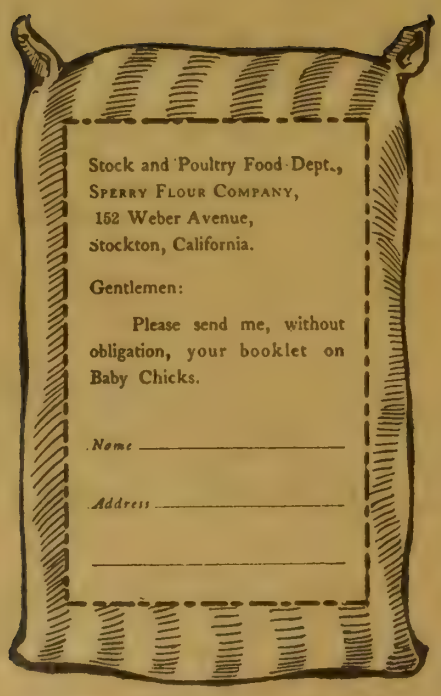
This is the strongest engine harrow of its type sold on the Coast. Heavy axles, heavy discs. Built for service. Do not accept any imitation said to be the same. Only one genuine "ARNOTT" eight, nine and ten feet wide. Write or call for full information.

ARNOTT & CO., Inc., 112-18 S. Los Angeles St., Los Angeles

The RIGHT START -that's the big thing!

Yes—and come to think of it—the right start is *everything!* For it is in the first few weeks that these baby chicks lay the foundation of their lives—of their future egg production—*of your very profits!*

Baby chicks are little bits of life but, at the same time, each one represents a whole chicken. That's why it is profitable to save every one.



It is here that Sperry Baby Chick Feed comes as a signal help. For it supplies *all* the food values that Nature intended a growing chick to have.

No matter what your methods may be—you can depend on Sperry Baby Chick Feed to produce results. Why? Because it is prepared by experts to meet the demands of fast-growing bodies. It is clean, uniform, properly granulated and proportioned for the delicate organs of the baby chick.

Also—remember this: Sperry Baby Chick Feed is *absolutely gritless.* You don't have to pay a fancy price for shell and grit. (You should, however, add about 5% fine shell and grit, when using.)

Sperry Baby Chick Feed is a perfectly mixed ration based on the *practical findings* of the most successful poultry raisers. That's why chicken raisers are so enthusiastic about it! That's why professional poultrymen are making money by using it! And so can you!

The new edition of our booklet, "Makes Hens Happy", explains just how to feed baby chicks—gives you the advice of practical poultry experts—tells you how to boost your poultry-profits. No one knows so much about the poultry business that he can afford to overlook the big money-saving and money-making suggestions to be found in this booklet. Your copy is waiting for you—and it's *free!* Simply fill in the coupon—and mail TODAY!

-It's a real handy Grain Bin

"I'M just independent enough," says one Farmer, "to want to hold my grain until I get ready to sell it. For that and other reasons I got my Calco Grain Bin.

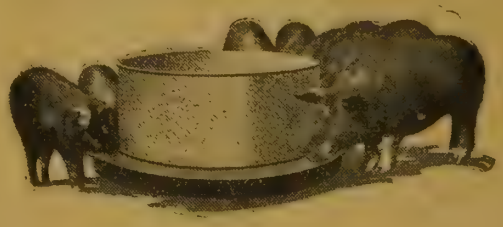
"And now I hold my crop—as long as I see fit. Another thing, when the rest of the boys are scratching their long hair over the scarcity of labor during harvest time, I go right ahead. Don't need so many men, with the Calco Bin.

"I picked a good, convenient place in my field and put my Calco Bin there. It is big enough to store my entire crop of grain. I haul right from the harvester to my bin—just like putting my grain in a bank's safe deposit vault.

"My Calco Bin gets ahead of the high cost of harvesting; saves sacks, cheats rats and stays dry inside. Let it rain, I say, my crop is perfectly safe—until I get ready to move it.

"I'll say this:—everything else being in favor of the Calco Grain Bin, it is also a real handy grain bin. And I've already paid for mine out of what it saved for me last year."

and CALCO Products for Hogs are right



Calco Automatic Grain Feeder

Constant feed to hogs, without waste. Cast-iron bottoms and trough, rust-resisting iron bin. Capacities from 2 to 10 bushels. Send for circular.

Calco Automatic Hog Watering Fountain

Continual fresh water, without overflowing. Safe, sane and sanitary. Get the price lists for detail description.

Calco Hog Watering Tank

Designed to give same service as the Automatic, where water must be carried or hauled. Saves time, and keeps water clean. Ask about this Tank.

Write for the Calco Grain Bin Booklet; it's free. If a Calco Bin is worth anything, it's worth knowing about. Write now.

Calco Hog Trough

Built of Armco Iron—strong, durable. Smooth bottom—sanitary. For healthy hogs. Length from 24 to 120 inches. Ask for circular—now.

Citrus Growers Institute at San Bernardino

By C. B. Messenger

THE orchardist who may have a hope that we are gradually working toward a solution of the questions of soil culture and general orchard practice had an awful shock if he attended the institute of citrus growers held in San Bernardino at the time of the National Orange Show.

A wonderfully fine program was given by some of the state's most practical orchardists and expert investigators, likewise by specialists of United States department of agriculture. Especially were questions touching upon chemistry and bacteriology of the soil left in most uncertain and indefinite shape. The specialists sometimes made definite statements, but hastened to qualify and provide for certain contingencies which might arise in case of the individual orchardist. Nor can this be otherwise, for there is no end to the different situations which may arise, for chemical conditions and the minute forms of life are a large factor in understanding soil conditions. We must all consider these varying conditions, and the grower who is seeking for a set rule is finding that, as one speaker said: "There is no set rule for anything." Farming involves a special study of every problem with consideration of all the environment. In no section of the world is this more true than in California.

Some of the most definite information was given by Prof. Shamel. He began by stating that his work was still connected with the problems of bud selection and how to produce trees which will grow greater and finer crops of citrus fruits, but that for this particular occasion he was going to ramble in other fields and discuss soil fertilization. Proving, in a sense, an alibi, he was in position to cut loose and state facts without any responsibility. A part of Mr. Shamel's address on furrow methods of applying manure is given on another page of this issue, but the practical application of methods as followed in some experiments he has observed will be given later, as will valuable material from others of the addresses.

The greatest interest of the convention centered in the soil culture discussions on the first day. The large assembly room was packed to the walls, while the second or last day of the institute, when marketing and fruit waste products were under discussion, did not call forth such general interest. Perhaps the grower feels that the marketing question is nearer solution, or at least is not pressing for immediate answer as is the problem of yellowing of leaves and the securing of soil conditions which will permit of greater production of larger and finer fruit. Even the matter of frost protection, which was most ably handled, called for less interest than did questions regarding the soil. These latter were handled from nearly every angle and in such a way as to give the grower, who uses what's above his collar to the best advantage, much valuable information.

The convention was called to order by Dr. H. J. Webber, head of the citrus experiment station, and W. M. Parker, president of the National Orange Show, gave hearty welcome, so hearty in fact that a resolution presented that the citrus institute should be an annual event in connection with the National Orange Show, was carried without a dissenting vote.

One excellent feature of the program was the fact that it was carried out almost to the letter; everyone scheduled to appear was there and on time.

Statue of Victory and Archway at Entrance

The National Orange Show exhibits are still housed in tents but the entrance is made most attractive by these ornamental structures.

Orange County and Her Princess of Victory

At the top of the globe, on which outlines of various continents are made of oranges, are shown a number of figures, of which Uncle Sam is one, vigorously engaged in kicking the kaiser off the earth.

Some Points

E. E. Thomas: Shorten your furrows; don't try to run water down furrows six or eight hundred feet long; 250 to 300 feet is better on most soils. Irrigate at longer intervals and give deeper and less frequent cultivations. In beginning irrigation don't flush out the furrows, in other words, don't send down a big head to the end, then shorten or lessen the supply, for the flushing is resulting in silting up and greatly lessening the power of penetration.

Dr. W. P. Kelley: Be sure you are not carrying alkali into your soil by the use of waters which carry too great a proportion of these deleterious substances. Some waters used for irrigation on California soils have been found to carry practically a ton of alkali to each acre of land irrigated during one irrigation season. Soils which are naturally porous and well underdrained may tolerate this treatment for some years, but there is ultimate danger to almost any soil in the use of such irrigating water. Other soils which are not underdrained and already contain a quantity of alkali may be totally unfitted for crop production after a very few years. Where such lands have already been injured the only solution is underdrainage. It is not so much the amount of salts in the water but in the amount the soil persists in holding.

Prof. C. A. Jensen: In experimenting in the mulched basin system the basin around the tree is to be preferred over the basin in the centers.

Dr. H. J. Webber: Rarely may we completely settle any question.

Foreman of the Citrus Station's Experimental Mulch Plant: The more I see of this permanent mulch basin business, the less I like it.

Dr. J. F. Breazeale: Farming by rule of thumb will never get you anywhere. Go home with something to think about. Intelligent opinion may be of great value. Fertilization is not a mechanical process, but a thinking process.

Dr. H. J. Webber: Be sure and register. Please write very plainly because there are some people who are desperately poor readers.

D. C. Lefferts: I tried the basin mulch system for three years; I spent practically nothing for soil culture in that time. I have returned to flat cultural methods because under the per-

Magnificent Commercial Packs Were Shown

This is the Riverside exhibit at the National Orange Show. Unfortunately this picture was taken before the ribbons were placed—Perhaps this was fortunate because they were so numerous they would have hidden part of the exhibit. In addition Riverside had a most attractive Garden of the Allies feature exhibit.

Agricultural News Notes of the Pacific Coast

Northern California

The heavy snow fall in the Sierras assures plenty of irrigation.

A farm bureau center has been organized at Browns Center, Yuba County.

Napa County paid out over $1000 in coyote bounties during the last half of 1918.

A new farm bureau center has been organized at Garden Valley, El Dorado County.

The Nevada County farm bureau will hold its annual meeting at Grass Valley, March 8.

The Nevada County farm bureau has endorsed an anti-dog bill now before the legislature.

Harold Mills has been appointed squirrel inspector of the Linda district, Yuba County.

The Placer County Growers Association is building a large addition to its plant at Lincoln.

A cattle dehorning demonstration was held last week at Birchville farm center, Nevada County.

The United States reclamation service is planning an irrigation survey of lands in Yuba County.

The winner of the pig feeding contest conducted by the Shasta County farm bureau is a girl, Gladys Gill, of Ono.

There will be farm bureau meetings in Glenn County at Elk Creek, February 26; Grape Vine, 26; Larkin Center, 28.

President Turner of the California Bean Growers Association is in Washington in the interests of the bean growers.

A Solano County branch has been formed of the California Cattlemen's Association. B. F. Rush was elected president.

There is a large planting of spinach in the Rio Bonito district of Butte County. The plants are maturing satisfactorily.

The rodent control division of the state horticultural commission has completed a rodent survey of Contra Costa County.

Sutter County has a new farm adviser. He is Chas. E. Sullivan, who succeeds J. E. Stiles who has gone on a farm of his own.

A "tobacco boom" has struck Esparto, Yolo County, because of stories spread abroad of the great success of Greek tobacco growers.

Farmers of the Dry Creek section of Placer County have joined with the state horticultural commission in a campaign against ground squirrels.

Every member of the Nevada County farm bureau will place before his farm home a sign bearing the words, "Nevada County Farm Bureau, Member, 1919".

The California Cattlemen's Association objects to the proposed enlargement of Sequoia National park unless grazing is permitted within the new territory.

Eldorado County wants to keep its farm bureau and farm agent and is protesting against the cut in the appropriation for maintenace of farm bureau work.

Prof. J. C. Whitten of the pomology division of the University of California has been giving pruning demonstrations in different sections of Tehama County.

Central California

The clocks will be turned forward again on the last Sunday in March.

Several new alfalfa ranches are being established near Terra Bella, Tulare County.

Sale is reported of a large portion of the Miller & Lux Ranch in Santa Clara County.

Watsonville, Santa Cruz County, is still shipping some 60 carloads of apples every week.

The board of directors of the Terra Bella irrigation district has offered for sale $40,000 in bonds.

Hog day at the Tulare stock corrals resulted in 510 fat hogs being auctioned off at around $15.

The sheriff of Santa Cruz County is warning owners of live stock to stop grazing their cattle on the public highways.

California has more than 5000 apiaries, averaging 100 colonies each. In addition thousands of farms have a few hives.

Another large canning factory is announced for San Jose. The plant will call for the expenditure of more than $2,000,000.

Symons Brothers of East Bakersfield started in the sorghum business last season, making 12,000 gallons of syrup and threshing 900 sacks of seed.

At the two auction sales held by the Stanislaus County farm bureau at Tegner since the beginning of the year, $34,367.93 worth of hogs have been sold.

During the month of January 1889 cows were tested by the cow testing department of the Stanislaus County farm bureau.

During the past few weeks Monterey County pruning demonstrations have been held at Carmel, Greenfield, Prunedale, Aromas.

Orange growers of Tulare County met at Lindsay, Saturday, February 15, to talk over proposed orange standardization laws.

Considerable planting of lettuce were made in the Pajaro Valley this season, giving good crops and promise of a growing industry.

Fresno County has 1346 acres of apricots, 1666 of figs, 350 of olives, 1728 of oranges, and is drying and shipping peaches from over 24,000 acres.

Meetings are being held in Kern County, to interest growers in asking aid from the government in the storage of waters from the Kern River.

Horticultural Commissioner Buhn of Kern County estimates that 3000 acres will be planted to Thompson Seedless grapes in the county this year.

The plantings of cotton in Kern County last year were so successful that a much larger acreage is to be put in the coming season. Better ginning facilities are needed .

The horticultural commissioner of San Benito County finds considerable brown rot attacking apricot orchards. He recommends that all apricot growers search out affected wood and cut it out at once.

Fig growers who met in annual session at Fresno last week decided to organize a cooperative packing and marketing association along the lines of the California Associated Raisin Company. A committee of ten was appointed to outline a constitution.

Southern California

Holtville shipped out 500 cars of live stock during 1918.

The Yucaipa Apple Association has disposed of its entire pack.

The Tulare Cooperative Poultry Association conducted a $17,651 business in January.

The southern end of the state reports about 1,000,000 sacks of Lima beans still on hand.

California Lima Bean Growers Association has decided to admit more beans to the association pool.

One hundred and twenty-five tractor students are attending the tractor training school at Santa Ana.

Elsinore wants a new cannery, and last week was "cannery week", everybody boosting for the new concern.

Bean growers hope that with the opening of markets to California beans the worst of their troubles are over.

The lives of the parent navel orange trees at Riverside have been saved by inarching and bridge grafting.

The California Apricot Growers Association has won its suit against a Ventura County member for non-delivery of fruit.

Citrus growers are discussing Senator Kings bill which plans for frost insurance. "Economically sound" is the verdict of many.

Horticultural Commissioner Waite of Imperial County estimates alfalfa plantings will show an increase of 20 per cent over last year's.

More than 6,000,000 pounds of sugar beet seed were raised in this country last year. Before the war the production of sugar beet seed was almost at zero.

Bean prices continue to drop daily. Few shipments are being made. The United States Grain Corporation has promised to give its attention to straightening out market conditions.

The Carpinteria Walnut Growers Association held its annual meeting last week. The secretary's report shows that the association had handled nearly 1,000,000 pounds of nuts. L. T. Webster was reelected president, and J. W. Young secretary.

A very complete system of car fumigation at the Texas borders it is thought will keep the pink boll worm from the cotton of Arizona and Imperial Valley. In addition where cotton refuse is found imbedded in the cracks of cars freight is transferred to clean cars at the border.

Field Agent Kaufman of the United States bureau of crop estimates states that about 17 per cent of the navel oranges on the trees January 1 were rendered unmarketable by the freeze. The annual meeting of the state farm bureau will be held in Riverside, April 2. One hundred and fifty farm organizations from all over the state are expected to attend the conference.

E. R. Root, apiculturist of Medina, Ohio, and well known authority on bees, has been visiting California. He says: "Los Angeles is the center of the greatest honey industry in the world. Within 100 miles of Los Angeles are most of the great apiaries of the Southwest. This country has the longest honeymaking season I know of, and the finest grade of honey is made here from orange blossoms, sage and alfalfa."

The Coast and General

The state engineer of Arizona has just issued a report of the road work for the past two years. This contains nearly 100 photographs of the different highways of the state.

Construction is expected to begin upon the Willow Creek water storage dam, near Prescott, Arizona, early in the spring. This will develop about 15,000 acres of land.

"Feeding Yucca to Starving Cattle" is the title of a new bulletin just issued by the University of Arizona state agricultural college, and gives an account of feeding this plant to range cattle after being ground up with an ensilage cutter.

Entomologists of the United States department of agriculture last fall made examination of the cranberry bogs of the Northwest because it was feared they might have been infested with gypsy moth. They found the bogs in good condition with no evidence of the moth.

The Wenatchee district of Washington, comprising Chelan, Okanogan, Douglas and Grant Counties, shows a decreased acreage in fruit trees, amounting to 7000 acres. These figures are given from a recently completed orchard census by the district horticultural inspector.

A grange warehouse and store was organized at Monroe, Washington, recently, to be known as the Grange Warehouse Company of that vicinity. The purpose of the corporation is to purchase feed, groceries and other goods for its members at cost price plus five per cent to cover expenses, and to sell products which its members may desire to dispose of.

The congressional medal of honor has been awarded to Captain John H. Pruitt of Alhambra, Arizona, who is credited with having captured two machine guns, killing the crews and later taking 40 prisoners single handed. He is said to be the only Arizona boy so far to receive the congressional medal of honor.

The California state highway commission has endorsed the road from San Diego to Yuma as the preferable highway from Los Angeles to Phoenix. It is to be hoped that some plan will be perfected whereby Arizona and California will cooperate in the matter of building an interstate highway between these two states.

Dr. Richard E. Kunze, a noted scientist who has made his home near Phoenix, Arizona, for the past 20 years, died early in February. His home was called the "Cactus Farm." Dr. Kunze had made a specialty of the various cacti found in the Southwest and had furnished most of the botanical gardens of the world with different varieties of cacti. He was an international authority on the subject and wrote several scientific books and pamphlets.

T. T. Forman, a dairyman west of Phoenix, says that one year ago he purchased 44 tons of hay to feed his 40 head of cows and horses on his 40 acre ranch in addition to the feed produced on the farm. Last year he built a 140 ton silo, filling it from corn grown on the farm, and in addition grew eight acres of cotton and fed fully as much stock without buying feed. Mr. Forman makes his dairy pay him at the rate of $125 per acre for his 40 acre farm.

The Troubles of the Tractor Farmer

By J. B. Neff

FARM tractors have come to stay and are sure to become more popular with each succeeding year because they will be more carefully built and of better material and because the operators will be better educated along mechanical lines. However, there are many points of difference among tractors as well as among the users that will not be settled soon.

The man who is farming a large

J. B. Neff

number of acres, whether in grain crops or in orchard, will be able to determine the particular style of tractor suited to his needs with much less annoyance and cost, relatively, than the man with fewer acres, since the man with two or more tractors can always have some machines at work while the man with only one machine may see his land drying out and causing loss of crop which he is unable to prevent when something that he is unable to have repaired or replaced at once goes wrong on the tractor. The delay in this case is much more noticeable than when horses are used since, when one horse out of a team of three or four is temporarily disabled, the work may proceed at a slower speed and without any serious loss, but when a bolt gets out of a tractor all movement stops.

The farmer having a large acreage finds trouble in getting competent tractor operators, but he also has trouble in finding men who will properly care for a team or who, in the last few years, will drive a team at all. The smaller farmer, that is the one with less than 20 acres, finds a greater cost per acre in working a tractor than a team when he cannot operate his own tractor and is not able to get outside work to keep the tractor busy, but this shortage of operators will gradually disappear. The University of California is doing an excellent work in its tractor schools which are being held in various parts of the state for the education of tractor operators, and it will soon be possible for the uninitiated tractor owner to get expert advice from his next neighbor.

Cultivation is primarily intended to improve the mechanical condition of the soil, thereby allowing the moisture and air to enter and to conserve the moisture that has gone into the soil, by that means increasing the productions of the plants and trees, but there is more or less packing of the soil in all farming operations; either by the feet of the horses, the wheels of the implements or the wheels and tracks of the tractors. The tractors having more weight and power and hauling larger loads are the worst transgressors in that respect, and particularly so when heavy machines are operated on wheels with small bearing surface, whether with open or closed rims. A wrong impression is often left with the casual observer who sees the surface soil apparently well pulverized after a heavy wheel has passed over it, but if a shovel or a hoe is used to clear off the upper two or three inches a much different condition will be found. If a few trips of the tractor are made over the same path the condition will be much like a road, and if the soil was at all wet when the tractor was used it will be very difficult to get water to penetrate the soil a few weeks later.

Many of these conditions may be obviated by the careful farmer who knows the difficulties to be overcome, and successful tractor operation is like all other farm work, because the thinking, careful man succeeds where others fail.

IT TAKES A HEAD TO GET AHEAD

THE sturdy, independent farmer, the one who knows his business and attends to it, yet the one who is always seeking for the newest and best in his own calling, is the one whom the Cultivator prizes most in its effort to secure for its readers the most of inspiration and help in the difficult work of farming against the climate, systems of marketing and other handicaps.

Almost every mail brings to the Cultivator office manuscript offered for sale, touching upon almost every phase of farming — and sometimes no phase of farming—and these manuscripts are returned, even though sometimes possessing considerable literary merit. But when we can get the practical farmer to say something we feel that we are securing real value, and we are glad to say that for more than 30 years a great number of such men have given this practical help to our readers.

One of these men is J. B. Neff, who has given many answers to problems of Cultivator readers on such questions as growing and caring for walnuts, handling irrigation waters, alfalfa growing, etc. Mr. Neff cannot exactly claim that he is a native of California though he has been here for many years, the earlier part of his life being spent in the Sacramento Valley. For more than a score of years he has been a resident of Orange County, for many years conducting farm institutes in Southern California for the University of California, but he made his principal business that of raising walnuts, oranges and alfalfa. His 70 acres was entitled to an irrigation right calling for gravity flow from the waters of the Santa Ana. This has been supplemented by an efficient pumping plant on his own place, which has given a double right and practical independence even in dryest of years.

Mr. Neff has a practical hard-headed way of using his pencil to determine as to the profitableness of any step he is about to take. For instance, we may refer back to the Cultivator of December 21 in which he discusses with Cultivator readers regarding the pruning of old orange trees. In fact, we will quote a portion of that article.

"While very large oranges are usually sold at a discount there is seldom a loss on the large sizes and usually a very nice profit over the amount received for the same number of oranges of smaller size. If we take 100 boxes of size 176 to the box at $4.00 per box we have $400 and then the same number of oranges (17,600 oranges) in a size making 200 to the box we will have only 88 boxes which at the same price are worth but $352. There is a saving in picking, packing and boxes on the small size of about 50 cents a box, or $6.00, but after making this allowance there is a difference of $62 in favor of the large size while the difference in diameter of the two sizes of oranges is but one eighth of an inch. If we take size 176 at $4.00 per box and size 126 at $3.00 per box, with a difference of one-quarter inch in diameter, we have 140 boxes of size 126 worth $420, with a cost of extra boxes and work amounting to $20, or the same net amount as received for 100 boxes of 176 size.

When the price of 176 and 200 sizes is $3.00 per box there is a difference of $36 net in favor of the large size, and at $3.00 per box for 176 size and $2.50 per box for 126 size there is a net return of $20 in favor of the large size for each 17,600 oranges."

In last week's Cultivator we used the photograph taken with the Cultivator camera in which were shown two uprooted walnut trees both in perfect health but still not producing as liberally as they should. Their room was considered more valuable than their presence in the orchard, and we doubt not Mr. Neff figured as conclusively the profit or loss because of the removal of these trees.

Early in the orchard game Mr. Neff made every foot of his orchard count by growing intercrops, but more recently his orchard trees have not only used all this intercrop land, but during the past year have shown desire for more ground and air and sunlight, so, as shown by illustration on this page, some of these trees are compelled to give way to allow more nourishment to their fellows—and consequent larger crops. A look over these orchards shows them to make up one of the most successful producing California orchards.

Recently Mr. Neff has disposed of the greater portion of this ranch—which we believe we are justified in saying is a bit of good fortune for Cultivator readers, for the extra time now at his command will result in his giving us articles on practical farming topics. We have asked him to start with a few suggestions for the tractor user.

Mr. Neff became convinced of the need of more economical culture and felt that it could be secured through the use of farm power instead of employing as many horses as he had found necessary. One of the smaller orchard type of tractors was secured and his troubles began.

Some of these troubles will give the basis for Mr. Neff's practical talks and some of the compensations which his persistence made possible will likewise, we believe, give suggestions to other practical tractor operators which will aid in securing their successful use.

We ask for questions and suggestions from tractor users, for every user of the tractor is operating in a field where there is but little experience of others to guide. There are tractor schools being held in all parts of California, and the opportunity given by these schools and by demonstrations is being availed of, but the lessons which are learned in the university of hard knocks are sometimes more easily grasped and may be fully as informing as those gained from books and under the direction of the

Melilotus and Weeds to Turn Under

Mr. Neff, at right, discussing the matter of putting under the growth of Melilotus and native weeds which have been encouraged to cover the ground. The weeds will be allowed to grow another month, then if needed heavy irrigation will be given; deep plowing will follow.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

We recently heard an incident of a restaurant orchestra which was rambling through a medley of old-time songs and before they were aware found themselves playing "The Watch on the Rhine." Confusion reigned for a moment, then silence. But "A New Watch on the Rhine" is permissible. The American boys are already there, and if Clemenceau's ideas are carried out, they, or their like, will remain there. In any case Germany is learning some things these days, and we may teach them further lessons, especially how to mareh to the tune of "The New Watch on the Rhine."

This illustration is adapted from an illustration used by the Reclamation Service.

THE ANGELES

Mayor Woodman of Los Angeles has chosen Angeles as the name of one of Uncle Sam's larger merchant ships. The honor of naming this ship was won by Los Angeles in the fourth Liberty Loan campaign. During that campaign the city sold Liberty bonds to 246,001 people. This was by far the greatest number to subscribe in any city on the Pacific Coast. Los Angeles' quota of $41,666,90 was exceeded, the total being $48,886,350, 116.85 per cent of its quota.

San Francisco's quota of $107,876,-500 was exceeded, $110,836,150 being subscribed, her percentage being 102.74.

ORCHARD COOTIES

It is about the time of the year when letters of inquiry will be coming to this office containing tips of young twigs and a letter, almost impossible to decipher because of the smear of mashed aphis, with request for information as to what these insects are. These aphis, or plant lice, or, as they have recently been termed, "orchard cooties," are the pest of almost every crop which grows. They are very small, black or green or gray globular insects, infesting the tender growth of various plants, especially weeds, and busily engaged in sucking the life juices of the plants. On fruit trees they do much injury to young buds and more to the new growth. On the orange they cause a disfiguration and prevent growth on infested branches. It is probable that a serious infestation will appear this season. It should be met by early and persistent dosing with kerosene emulsion, tobacco extract or other spray.

BEANS BRIGHTER

The bean situation has stirred the country from the Pacific to the Atlantic. Note the eastward trend, for the agitation did start on this side of the continent, and even sleepy old Washington is getting active, as is indicated by private letters which show that there is appreciation of the fact that there has been serious discrimination against American bean farmers. It has been announced that government orders have been placed for 700 cars of California and Michigan beans, the order being divided fifty-fifty. This is hardly fair to California for earlier estimates showed more than 65 per cent of the present holdings in California.

However, something has been started and while prices are not advancing, in fact, in some cases still declining, yet beans are moving.

Now San Fernando Valley is organizing a bean pool. It is proposed to proceed at once with marketing and reduce the great storage in that valley, but more permanent organization is anticipated which will lead to advertising and in a general way advance the interests of bean growers.

FROST RISK

C. C. Teague of Limoneira Orchards has no doubt whatever of the profitableness of frost fighting campaigns which have been conducted on that ranch for many years continuously since 1913. The best of it is Mr. Teague has very definite figures to show the results of this campaign. The trouble is that many another orchardist who has attempted frost fighting has not had exact figures, neither has he followed methods which resulted so favorably as in Mr. Teague's case.

This season's cold and the more successful efforts made by many of the growers, together with the careful investigations which have been conducted by Dr. McBeth on the Leffingwell Ranch and by orchardists from the Pomona and Claremont district, the latter under direction of experts of the weather bureau, will induce more complete preparation before another cold season comes to the citrus districts. New smokeless heaters have been devised which, while costing a large sum, are most efficient—and nothing will answer for orchard production unless it is efficient.

We believe that before midsummer is passed our orchardists will be making a very definite campaign for better protection another year.

LEAGUE OF NATIONS

The United States Senate appears to be somewhat obstreperous as to endorsing the League of Nations idea. The Senate is somewhat peeved over various political moves of the president and it appears it may make the people suffer. Ultimately the wishes of the people will be made known to the Senate. The people know what they want and that is the ending of war. The League of Nations offers to do that thing. The League of Nations may not be wise enough to make entirely good, but so far as the best human judgment of this day goes it's the most forward step ever made.

The Western Congress for Peace held in San Francisco last week made an effort to inform the people of the Coast as to the necessity for instant and emphatic action.

In addressing the delegates at that meeting Ex-President Taft said:

"The question is not political. It is a practical problem that is essential to the peace treaty. President Wilson is a democrat and I am a republican, but our differences with respect to party matters end at the Atlantic Ocean and the Pacific Ocean.

"For four years we have been discussing how the world can make something out of this war. And now a plan has been adopted to be presented to this nation.

"We thought that war was silly and that nations could have neither good sense nor sound business ability nor common prudence if they could permit wars to happen. We thought we had too much sense to get into it—and then we got into it ourselves. I believe we regret now that we did not get into it earlier. I am offering no criticism, for our hindsight is always better than our foresight.

"Now what I want you business men to do is to use your foresight in this emergency instead of your hindsight. You cannot afford to ride with your backs to the engine, seeing only what has gone behind you."

FEDERAL QUARANTINE

The federal horticultural board of the United States department of agriculture is placing restrictions on the dumping in this country of a promiscuous collection of trees, plants and seeds regardless of the country they come from. This step should have been taken long years ago, for many of our horticultural troubles have come from these importations. It is not the fault of California for it has made a persistent fight to have the federal government observe some of the common sense precautions which this state has long observed. Notwithstanding the wisdom of this step is self evident it has caused a vigorous protest from the large importers. The department, however, is standing pat, and in calling attention to the reasons for the action says:

"With respect to this action as to European countries, it may properly be noted that this quarantine merely places the United States in more close alignment with (but still behind) the action long since taken by these countries relative to plant imports from the United States. France, Holland, Germany, and to a less extent Belgium, have long maintained practically complete prohibition of plant imports from the United States.

"With regard to the actual condition of nursery stock and other plants hitherto received from foreign countries, it is appreciated that the countries which have been most concerned in such exports to the United States have established inspection and certification service, which have very greatly reduced the amount of infestation on such exported plants. The conditions in this respect, prior to the passage of the plant quarantine act and the requirement of inspection and certification on the part of foreign countries, and the rigorous holding of these countries up to as high standard as possible, were deplorable. Brown tail moth nests and gipsy moth egg masses and numerous other insect pests in various stages were coming into the United States in quantity, and in one season thousands of such brown tail moth nests were found in nursery stock, particularly from Holland, Belgium and France. The improvement since the establishment of this service, as indicated, has been very great, but it has not by any means eliminated the danger."

DON'T SWEAR IN THE BARN

At the national dairy show last fall a herd of pure bred cows was exhibited by a breeder of the Northwest. As he had brought his cows many hundreds of miles he felt especially concerned regarding their care and attention. One of the measures taken to secure their contenment was the posting of a sign:

"No Swearing Allowed.
These are Contented Cows."

In explanation the manager said: "It is a stringent rule on all our stock farms that harsh language or unkindness toward the cattle is absolutely forbidden. Strange as it may seem, a cow is as responsive to pleasant treatment as a human being is. If you are mean to a cow she is pretty apt to return the meanness. Therefore we preach bovine optimism. We keep our cows contented and we find they give more and better milk."

Good ethics; better sense.

BETTER FARM HOMES

There will soon be returning from the front thousands of boys who are more or less incapacitated but still able to do much manual labor. Patriotic interest in their case on the part of all will make it easy for these boys to secure labor and at probably nearly standard wages.

The federal government through its board for vocational education is making an effort to reach this class of young men to prepare them for something better than mere manual labor. As noted above, these young men now find it easy to secure work, but as time passes and labor becomes more plentiful and the inability of the maimed man to give a full day's labor becomes more apparent, they may be set aside and the husky put on the job. Hence this effort on the part of the federal government.

Every wounded or incapacitated returned soldier should connect himself with the vocational board and get the help which the government stands committed to give.

We recently referred to the fact that six high schools in the state of Arizona are operating under the Smith-Hughes act. Noting the item, Mr. J. B. Lillard of the California state board of vocational education writes:

"In this connection, I am wondering if you would be glad from time to time to insert brief news items regarding the progress of vocational agriculture in high schools of this state. All of the educational forces at work have some ultimate purpose. Agricultural journals, university extension through farm advisors, club leaders and others, and vocational classes in the high schools, are all looking toward better farms, farm homes, and farmers."

Hence, state and nation are united in the making of better conditions for farming and farm homes.

To secure information regarding the federal board write Federal Board for Vocational Education, Washington, D. C.

CITRUS GROWERS INSTITUTE

Continued from Page 273

manent basin system I was unable to get water down in all sections of the orchard. As I plow down the checks, however, I find the soil in far better condition than it has been for several years before the mulching trial.

Dr. W. P. Kelley: Plowsole prevents effective distribution of fertilizers.

Prof. C. B. Lipman: Now we can recognize how ignorant we are as to the science of fertilization; there is no rule based on science other than the rule of trial.

Prof. A. D. Shamel: In Bahia there is no cultivation but weeds are mowed. But, bear in mind, every orange grower in that section is also a dairyman, and applies dairy wastes to his orchard. Orange trees in Bahia are plenty from 60 to 80 years of age.

Yellowing leaves indicate nitrogen starvation. Broadcasting stable manure may result in a loss of at least 50 per cent of its nitrogen.

J. A. Prizer: Don't trench so as to bury your manure too deeply. Some have put valuable manure in deep trenches, which has become waterlogged and refuses to decay. Drainage, air, warmth are necessary to make plant food in coarse manures available.

Dr. Thos. Forsyth Hunt: The problem which dominates French agriculture is depopulation. In 1885 the total births of France were 1,200,000, and in 1914 the annual births had fallen 700,000.

Old people thus constitute a larger proportion of the population than in any other country. In twenty years the generation 45 to 60 will be dead. The generation 20 to 45, which has been fighting for the liberty of the world, has been decimated. The generation 1 to 20 is too small to carry on successfully.

The great problem, therefore, of French agriculture, is to make human labor more productive. It is not strange that their leaders place emphasis upon the need of fertilizers to increase yields, upon the use of labor saving machinery to cultivate and harvest the crops. Both in France and Italy we were told that one boatload of phosphates from Africa would be equal to 15 boatloads of food from America.

With this problem goes what the French call remembrement. It is not uncommon for a farmer to own 25 acres in ten different parcels. In the devastated area, especially, but in all parts of France, this is the burning issue, in order that farm machinery may be used to better advantage. Some believe that remembrement is not desirable unless it is done voluntarily. Others believe it will not succeed unless required by law. In any case, it is a problem of great delicacy.

C. S. Milliken: California is planting more productive orange trees as the result of Mr. Shamel of the department of agriculture's investigations. Only buds from trees of known producing ability should be used.

Dr. I. G. McBeth: Much of the advancement which has been made by this great industry is due to practical methods of our citrus growers.

(Dr. McBeth has, however, with the aid of the laboratories of the Leffingwell ranch which is in charge of Mr. Allison, made investigations which will be invaluable to the citrus industry in the matter of frost fighting. With the aid of a small refrigeration box Dr. McBeth has determined the freezing temperature of Bloods, 29.3; Sweets, 29.66; Navels, 29.66; Valencias, 29.82; Lisbon lemons, 29.57; grapefruit, 29.03.)

C. C. Teague: The industry is to be congratulated in that it has the services of men of trained intellect like Dr. McBeth. In the matter of frost fighting don't wait till the damage is done; fire up quicker.

Willis Jones: The weather bureau has rendered service in assigning Mr. Young to make investigations of result of frost fighting efforts.

Thos. Crawford: The cull has brought practically no money when thrown on the market as a fresh fruit, yet has filled the market and prevented sale of good fruit. We are using 100,000 pounds of this low grade fruit daily in the manufacture of high grade marmalade and by this means we hope to return to the grower more than his cost of production.

Other addresses were made by W. M. Mertz, F. O. Wallschlaeger, G. Harold Powell and Prof. E. M. Chace of the United States Citrus By-products Laboratory of Los Angeles.

The committee responsible for the institute arrangements consisted of chairman, H. J. Webber; L. V. W. Brown, D. C. Lefferts, R. O. Price, J. H. Strait, Dr. J. P. Scott, J. R. Yerxa.

NINTH NATIONAL ORANGE SHOW

RIVERSIDE is all puffed up over her winnings in the Ninth National Orange Show. We saw a chesty individual looking at the vast number of banners which the county had won. It developed that he was County Commissioner Sharp, and we asked him if the county had taken anything. "Taken anything? We have taken everything excepting the tent and we'd have taken that if it were not staked down so tight." However, there were some other counties, communities and individuals who likewise took some of the honors.

The list below gives more explicit information as to the quality of exhibits, and as to the spectacular, the features were perhaps not so spectacular as in some of the former shows, but there were more finished artistic effects. Above all, it was shown that Southern California has produced, notwithstanding "the late unpleasantness", some wonderful fruit quality. The commercial packs of fruit were exhibited in attractive "banks" around the outside of the great tent, leaving the center for feature displays, and also leaving more opportunity for the public to freely circulate.

One particular feature was a table showing 92 distinct varieties of citrus fruits exhibited by G. W. Young of Orange County. These varieties included variegated navels, navel bloods, tangerine navels, Thompson Improved, Navelencias and even the Parson Browns and Louie Gim Gong, but not a single Washington navel.

The tent in which tractors, trucks, autos and varied industries were exhibited was more conjested both as to the exhibits being closly packed in and as to the number of people attracted. Fruit growers seem to wish the latest information which will lead to better or more economical methods. The smokeless orchard heater was in evidence and proved smokeless by running continually two of the heaters, there being no smoke visible, neither odor, and this inside the tent. Several tractors were exhibited, as were many trucks and trailers. There was a great showing of farm machinery but the space was too limited to permit of general implement exhibit.

A. G. Kendall was chairman of the awards committee and announced the awards as made by the judges, Messrs. A. W. Swain, A. W. Hart, and W. H. Johnson.

Sweepstakes and Box Awards

Washington Navel Sweepstakes: Sierra Vista Packing Co., $100; F. S. Hooker, $50; Associated Chambers of Commerce of Orange Co., $25.

Lemon Sweepstakes: Upland Lemon Growers' Exchange, $100; West Highland Citrus Association, $50; Riverside Chamber of Commerce, $25.

Grapefruit: L. V. W. Brown, $75; Imperial County, $25; Upland Heights Orange Ass'n, $10.

Artistic Rack Display, 40 boxes of oranges: Upland Chamber of Commerce, $50; T. E. Anderson, $25; Cucamonga C. F. G. A., $10.

Artistic Rack Display, 40 boxes of lemons: Riverside Chamber of Commerce, $50.

Artistic Rack Display, 40 boxes of grapefruit: Imperial County, $50.

Eight Boxes Washington Navels: Sierra Vista Packing Co., Victoria Avenue Citrus Ass'n, Mike Krieg.

Four Box Lots

Washington Navels: G. A. Hansen Fruit Co., Cucamonga Citrus Ass'n, Victoria Avenue Citrus Ass'n.

Thompson Improved Navels: West Highlands Citrus Ass'n, Sierra Vista Packing Co., L .V. W. Brown.

Ruby Bloods: F. Fabb, Sierra Vista Packing Co., Victoria Avenue Citrus Ass'n.

Seedlings: Riverside Heights Orange Ass'n.

Valencias: L. V. W. Brown, Victoria Avenue Citrus Ass'n, Thomas Valtz.

Sweets: Cucamonga Citrus Fruit Growers' Ass'n.

St. Michaels: Associated Chambers of Commerce, Orange County, F. Fabb.

Malta Bloods: G. W. Bell, I. K. Vernon.

Tangerines: G. A. Jensen Fruit Co., Upland Citrus Ass'n, S. E. Tisnerat.

Plate and Other Awards

Highest Ratio Soluble Solids to Acids: Highland Chamber of Commerce, $10; L. V. W. Brown.

Lemons: Riverside Chamber of Commerce.

Grapefruit (Seedless): L. V. W. Brown, Victoria Avenue Citrus Ass'n, Mt. View Fruit Ass'n.

Commercial Pack of Washington Navels: Upland Citrus Ass'n, $25; T. E. Anderson, $10; Fred Wilson, $5.

Commercial Pack of Lemons: Lemon Growers' Exchange, $25; T. E. Anderson, $10.

In plate exhibits the following were winners taking first, second and third in the order given:

Washington Navels: Miss E. O. P. Stokes, F. S. Hooker, E. A. Zumbro.

Ruby Bloods: Alta Loma, F. Fabb.

Malta Bloods: Alta Loma.

Sweets: Alta Loma, M. H. Randall, Cucamonga Fruit Growers' Ass'n.

Grapefruit: G. T. Henslee, Miss Stokes, Upland Heights Orange Ass'n.

St. Michaels: M. M. Randall, Cucamonga C. F. G. A., F. Fabb.

Seedlings: Randall.

Tangerines: G. A. Hansen, Cucamonga C. F. G. A.

Valencias: E. S. Bishop, Alta Loma.

Greatest Number Variety: Associated Chambers of Commerce, Orange Co.

Artistic Plate Display: T. E. Anderson.

Tray of 12 Washington Navels: Stewart Citrus Ass'n, E. A. Zumbro, Mike Kreig.

Tray of 12 Lemons: Lemon Growers' Exchange.

Cluster of Oranges: Alta Loma.

Cluster of Grapefruit: C. A. Haggerty, D. G. Whiting, J. W. Read.

Feature Display:

Feature without mechanical action by Chamber of Commerce or Citrus Fruit Ass'n: Redlands Chamber of Commerce, trophy, banner and $200; Rialto Chamber of Commerce, banner and $125; Pasadena Board of Trade, banner and $75.

Feature with mechanical motion by Chamber of Commerce or Citrus Fruit Ass'n: Riverside Chamber of Commerce, trophy, banner and $250; Associated Chambers of Commerce of Orange County., banner and $150; Associated Chambers of Commerce of San Gabriel Valley, banner and $75.

Feature by individual, firm or corporation: Pacific Electric Railway, trophy, banner and $100.

Feature by city, county or municipal corporation: San Bernardino city water department, banner and trophy.

Special banner award to the United States forestry service for its educational feature display.

WALTHAM
THE SCIENTIFICALLY BUILT WATCH
AND THE FOREIGN BUILT WATCH

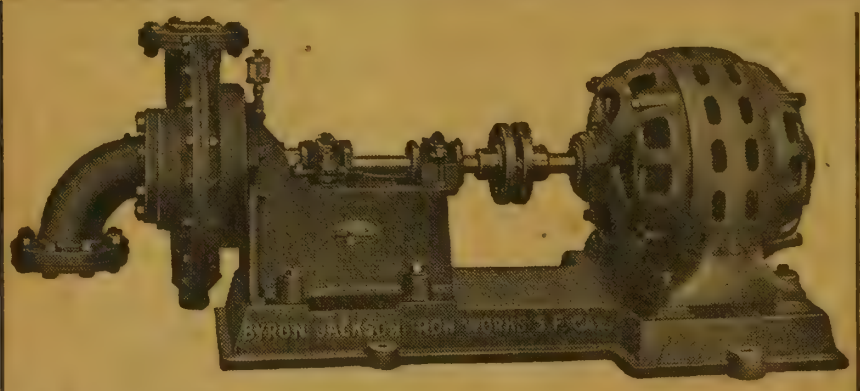
A Campaign to Aid You in Selecting Your Watch

THE hairspring is the brain of the watch. It is the most delicate tension spring made. For use in the small sized watch, 84,000 springs are made from one pound of steel, raising the value of that pound of steel from $5.00 to $30,000.

The Waltham hairspring steel is drawn through diamond surfaces, and for the smaller watches, to a third of the thickness of a human hair.

The Breguet, or over-coil (named after its inventor, a famous old French watchmaker), is used on every Waltham watch. The most important part of the complete operation in making a hairspring is the forming and tempering of this Breguet over-coil.

At Waltham, instead of being formed or bent by hand as a *separate* operation, the entire *completed* hairspring is *formed at one and the same time*, after which it is hardened and tempered *in form*—the invention of John Logan, American watchmaker, a genius who was a part of Waltham leadership in watchmaking. Indeed, Waltham is the only watchmaker that claims this perfect method of making the Breguet hairspring.



The foreign, imported watch movement has a hairspring that is first formed *in the flat*, then hardened and tempered *in the flat*. Then the outer coil is bent to form the Breguet over-coil, which, if the flat spring were *as hard as the Waltham*, and *properly* tempered like the Waltham hairspring, it could not be bent to *correct* form, and would be liable to break in the attempt.

Waltham superiority is in original method, secret process, unvarying quality of every important part of the watch—a quality that cannot be equaled by the foreign "hand" method of manufacture. That is why Waltham leads the world in standardized watchmaking, and why your watch selection should be a Waltham.

Frosted Trees in Florida

This method of handling frosted citrus trees in Florida is given by Prof. J. J. Grossenbacher, plant pathologist, in a recent Florida Grower:

The general experience of growers since the freeze of February, 1917, has convinced every one that it pays to give freeze-injured trees special care at least during the first year following such injuries. It is a lamented fact that some growers practically abandoned their groves in 1917 because they thought that since the chances for a crop that year were slight it would not pay to fertilize and cultivate them as usual. Some of those groves will not get back to normal bearing even in 1919, and others will have the first crop of any consequence this coming season. In other words, this neglect will have cost the short sighted growers from two to three crops. Those giving the groves the usual care in fertilization, cultivate them as usual. Some of those groves will not get back to normal bearing even in 1919 and others will have the first crop of any consequence this coming season. In other words, this neglect will have cost the short sighted growers from two to three crops. This giving the groves the usual care in fertilization, cultivation and spraying during the summer of 1917 not only got some fruit in 1917 but a very full crop in 1918. Their groves are also in promising condition for a large 1919 crop.

In view of these facts there is but one conclusion and that is to give freeze-injured trees more than the usual care following such injuries, even though the entire crop is lost and money is not on hand, it pays to borrow the money to carry the grove through the year. It is to be hoped that next time we have a freeze growers who are hard hit will profit by this experience and bring back the groves in the shortest possible time. It does not pay to be misled by the idea prevalent among some people that trees in freeze-injured condition are prevented from making efficient use of extra fertilizer and cultivation. The past season's experience with the insect pests also shows that it is impractical to neglect the spraying during the next growing period following a damaging freeze. As a result of the neglect of spraying combined with the usual amount of young growth produced in 1917 white flies and scales were offered ideal conditions for rapid spread. During the next two or more seasons growers have to pay high interest on this neglect.

Make Tractor Care a Habit

By C. L. Butler

DO AS WELL by your tractor as you do by your horses and you will reduce your cost per acre. Tractors, large and small, can be operated cheaper than horses but not on neglect. It takes time to care for a tractor, but only a fraction of the time spent on horses. Why not be fair and admit it? The fact that the time spent on horses is an old familiar job—"chores" in fact—does not make it shorter. Get the same habit with your tractor and you will be ahead on sleep.

Horses aren't left hitched to the plow all night. Why then the tractor? Don't try to get by with saying that it does the tractor no harm. There is no tractor built that will last as long in the weather as it will under cover. Nor is there an ignition system that won't be injured by exposure to a tule fog, nor a radiator to heavy frost. Bring your tractor home every night or at least give it a canvas cover. Remember that part of this job of getting lower costs on your farm operations is up to the farmer. The manufacturer can't do it all. A little time will save a lot of money.

Stop and figure how much time is spent taking care of horses. Watering, feeding, bedding, currying, cleaning out the barn, harnessing—will take twenty minutes a horse to do it? That's two hours a day for a six horse team. It takes at least as long to get horses from the barn to the field as it does a tractor. Generally the horses have to come back at noon, besides. Spend as much time intelligently on your tractor each day as you do on your horses and it will always be ready and able to work. Before you leave it at night get it ready to start in the morning. Fill the crankcase with oil and your tank with fuel. If it is going to freeze during the night, drain your radiator and screw the drain plug back in. In the morning fill it with warm water so that it will start easily. Always start on gasoline and run on it until your motor gets warm. Heat the manifold, warm the spark plugs and the carburetor if the morning is real cold. All these things can be done in a half an hour once you get the habit. Make it a "chore." In the warm weather a lot of these things are not necessary. Spend another half hour if you need to tightening up nuts and turning down grease cups and you still have gained an hour on the time you would spend on horses. When the season's work is done your tractor, after being thoroughly overhauled and properly housed, can be forgotten till next year's work begins.

Give the devil his due. You will lose little time with your tractor. Suppose you do have a breakdown? Suppose the agent is slow getting you new parts? (And maybe it is his fault and maybe it is the express company's.) Grant all these things. You can still catch up to your work. In a pinch the operator can drive his tractor 16 hours a day, or you can work two shifts and use the machine the entire 24 hours. A tractor does not need rest. Like horses, though, it does need care. And the better the care the less the delay. A careful, well informed tractor man can take any good machine and work it every day in the season. In an 11 hour average day he can easily keep his tractor working in the field ten hours. One hour for care of the tractor—ten hours working it in the field. There is a tendency for the farmer to feel that he is getting a little bit out of the work class when he buys his tractor. Provided he knows his work he can truly work four hours to accomplish the same results, but he still must work.

When a man buys a horse and snags it he blames himself. When he buys a tractor and "snags" it he blames the agent who sold it to him. This is largely a matter of convenience. Regardless of where the fault lies, there stands the tractor agent with his future dependent on the good will of his users. Being both conscientious and keen, he does all in his power to satisfy the owners. Far be it from me to advocate a change of heart for the tractor dealer who is really serving his owners. But the greatest service that can be done the farmer is to teach him to serve himself. The mollycoddle who is born in luxury and raised on a fond parent's apron string seldom accomplishes much. The same goes for the farmer who does not learn to care for his own tractor.

When quitting time comes don't desert your tractor like a Boche leaving a trench.

AVOCADO MEETING POSTPONED

The midwinter meeting of the California Avocado Association, which was postponed because of prevalence of influenza, will now be dropped entirely. The next general meeting will be the regular annual meeting in May. It has also been decided not to publish the annual report for 1918 until after the May meeting.

Protection of Citrus Groves by Heating

By C. C. Teague in Address Before Citrus Institute at San Bernardino

WHEN I was asked to discuss frost protection at this meeting, I was in doubt as to which phase of the question could be most profitably considered. Types of pots, frost fighting campaigns, care of equipment, etc., have been so thoroughly discussed by so many competent men at conventions, and in the press, all of which information is available to him who will seek it, that anything I might say along that line would only be a repetition. Therefore, I have decided to briefly discuss the fundamental questions, "Does frost fighting pay?"

In a recent article in the Cultivator the author discusses the question from an insurance standpoint as follows:

"When the frost fighting is actually on, we have well toward $60 per acre per year overhead.

"Frost loss, unlike fire loss, may not be entire. That is, presumably bearing trees will not be killed by any 'spell' of weather we may have in California. Also, presumably the loss of fruit will not be absolute. But, assuming that the fruit might be all lost, as was the case in most orchards in 1913 and that the bearing capacity of trees for a year or two may be affected, an arbitrary figure of $1000 annual risk may be taken. That figure, probably, is altogether too high, but in that case the annual overhead frost fighting cost is nearly six per cent on the risk. This is prohibitive from an insurance man's standpoint."

It seems to me that the author overlooked one important factor which caused him to draw a wrong conclusion, namely, the factor of risk.

The rates of fire insurance and life insurance are based upon experience and mortality tables. Perhaps an owner might not think a six per cent rate too high if he knew his house was going to be burned down every two or three years. There seems to be a growing sentiment against protecting orchards from frost. Some have concluded that the great amount of labor required to light the pots and to care for the equipment, the loss of sleep watching thermometers is not worth while and are either not putting their equipment out in their orchards or are selling it.

I visited a few weeks ago two full bearing lemon groves that were equipped with a good seven gallon oil pot to the tree, none of which had been lighted during the late unpleasantness. The trees were loaded with lemons, all of which were frozen so badly that none will be shipped. Every grower must decide for himself whether his experience in his particular location warrants him in taking the risk without protection. I occasionally hear a man say, "These frosts only come once in twenty-five or thirty years, and I figure that it is cheaper to take my loss when it comes than to prepare to fight." Have we forgotten that California has experienced four rather years?

1911-1912—Quite serious in many parts of the citrus district including Pomona, Rialto, Riverside and San Bernardino.

1913-1914—Disastrous to nearly all of California. Very few districts escaped without serious damage.

1916-1917—Serious in Central California.

1918-1919—Thirty per cent of the crop damaged. Twelve to fifteen per cent total loss.

Question—"Is the six per cent rate mentioned by the Cultivator too high for the man who has lost a considerable portion of his crop during these cold years?"

I happened to be present recently when one of our large citrus growers was asked the question by another, "Does it really pay to fight frost?" The answer was, "I have yet to meet a man that is real sure that he is doing any good." I was much surprised at this answer, and although he was a man whom I have known well for many years, I took occasion to reintroduce myself to him in order that he might meet at least one man that was sure that it does pay to fight frost, and that it has paid on the rather large extensive citrus grove of which he has charge. I am not surprised that some get the impression that it does not pay to fight frost after visiting groves that are equipped for fighting and finding the fruit partially or wholly frozen. This frost fighting is serious business. It requires thorough equipment, plenty of labor, organization, executive ability, good judgment and eternal vigilance. All of these factors are necessary to success.

Our properties are equipped with electric alarm thermometers with wires running from the coldest points in the grove to the bedroom of the assistant manager and foreman, which give the alarm when the danger point is reached. In addition, night watchmen are employed who keep a constant watch on temperatures.

The topographical conditions of California are so varied that weather predictions cannot be relied upon as a guide to action. Every locality must through some sort of organization be prepared to do its own watching. I learned of a grower recently who has devised a brilliant scheme of watching temperatures. His thermometer hangs against his bedroom window where he can switch on a light and watch it from his bed. This is almost too easy. Conditions in the groves vary so much from night to night that I fear a thermometer hanging on a bedroom window protected by the overhanging of the roof and by the building itself would not be a very accurate index of what is taking place in the grove. There is an old saying that the proof of the pudding is the pulling of the string.

Cost of Frost Fighting for 220 Acres—Per Acre

	1913	1914	1915	1916	1917	1918	Total 6 Yr. Av. Per Acre
Labor (Man and Horse, filling and lighting pots per acre	$45.70	$10.55	$10.65	$21.45	$20.60	$22.15	$21.85

The '49er says=
"the genuine GIANT dates back to 1866"

"I remember well when we used black powder for stump blasting and mining. Just after the Civil War the first Giant Powder ever made in the United States was manufactured in a little laboratory in what is now Golden Gate park.

"Out of that beginning has grown The Giant Powder Co., Con., with its chain of great plants and magazine stocks throughout the entire West. And the Giant Farm Powders are being used for stump blasting, boulder blasting, tree planting, etc., by thousands of Western land owners. Giant Powders have always been so popular that some people have thought any ordinary dynamite was Giant Powder, but that is wrong. The only way to get Giant economy and efficiency is to get the genuine Giant Powders made by the originators of the name."

Just tell us "send me your book," and we will mail you our valuable guide to blasting, "Better Farming with Giant Farm Powders."

GIANT FARM POWDERS
STUMPING EUREKA

Easy Ditching

THE "good old days" of a pick and shovel have become memories. Instead of spending a week on a mile of ditch, Mr. Farmer now completes the job in a few hours. He does a better job, too—and saves a BIG LOT of *valuable* time. He does it with THE Martin

GUARANTEED

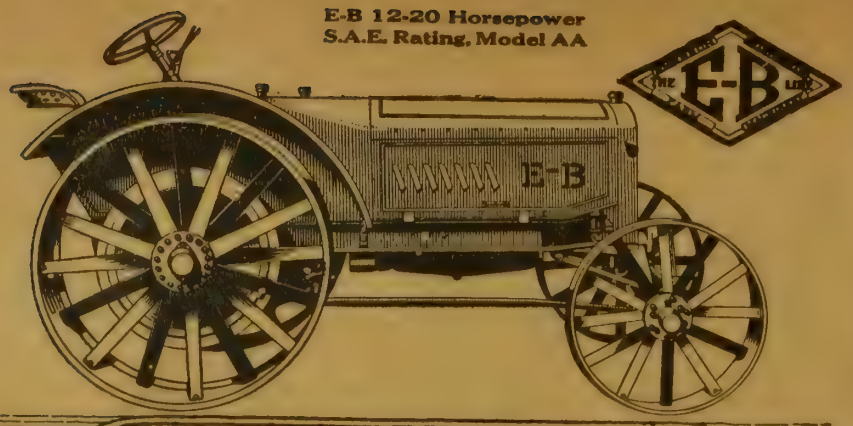
DITCHER, Grader and Terracer

Makes new ditches; cleans old ones; grades roads; builds dykes and terraces. Cuts alfalfa, Bermuda grass or sweet clover roots from ditch banks, without plowing. Does more work and better work than 100 men with old methods.

Made In Horse and Tractor Sizes

All steel. Reversible. Adjustable. No wheels, cogs or levers. More MARTINS now in actual use than all other farm ditchers combined. Warehouses and distributing points in nearly all Western States. Write for free descriptive catalog and nearest distributing point, together with list of MARTIN users near you.

Owensboro Ditcher & Grader Co., 1590 Wazee St., Denver, Colo.



Federal Farm Loans

Long Term Low Rate

All loans made on an amortization plan whereby the borrower repays the principal gradually with each interest payment.
Over three thousand satisfied borrowers in this district.
It will pay you to investigate.
For information apply to the nearest NATIONAL FARM LOAN ASSOCIATION or write direct to

Federal Land Bank of Berkeley

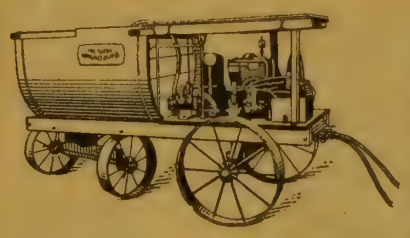
Only Pint of Water per Day for Cooling

NO overheating even though you work the E-B 12-20 AA Tractor all day in tough going. That's because it has unusually large water gasket space, a gear-driven fan and a high grade radiator of ample capacity. When other tractors of the same rating become overheated and stop work, this tractor is always ready to go ahead.

½-Ton Lighter Than The Average 12-20

Weighs 1000 pounds less than ordinary tractors of its rated power. Constructed almost entirely of steel. Furthermore, the E-B exclusive transmission on Hyatt Roller Bearings insures smooth, *complete* application of power.



Delivers 25 Per Cent Surplus Power

The rating of 12-20 is given to the E-B AA by the Society of Automotive Engineers—the most conservative rating known. As a matter of fact, this tractor possesses 25 per cent surplus power for emergencies—hard spots, hills, etc.

Any one of the family who can run an automobile, can operate an E-B AA. Its auto-type control and remarkable lightness for its power makes handling easy. All gears, including drive, run in oil and are absolutely protected from *all* dust, dirt and sand. Every part of the motor's driving mechanism is dust-proof enclosed. Ask your E-B dealer for complete facts.

FARM TRACTOR & IMP. CO.
PORTLAND, ORE.

The Famous Hardie Junior is a Real Power Sprayer

It has sufficient capacity for two lines of hose. It has plenty of power for high pressure effective spraying. It is little in first cost, engine power, pump capacity and ability to do successful spraying. We believe this is the greatest small power sprayer ever manufactured, and placed on the market with phenomenal success in every fruit section in United States and vouched by thousands who own the Famous Hardie Junior. Equipped with one and one-half horsepower engine, battery ignition, 150-gallon tank with mechanical agitator, capacity of four gallons per minute with a steady working pressure of 200 pounds, and two 25-foot of the best spray hose, fitted with spray rods and nozzles; 4-inch tire truck with pole or shaft.

ALL FOR $300. DELIVERED ANYWHERE IN THIS STATE.

If truck is not needed, deduct $55.00.
These prices are subject to change without notice. The wise buyer will place his order now.
This low price is made possible by big production.
If you are interested in other types and sizes of the HARDIE POWER SPRAYER write us for the big spray catalog, and learn why we can offer more spray pump value than any other spray pump manufactured.

The Hardie Orchard Gun Is Now $12.00

none better, all guns are guaranteed to satisfy the user or their money refunded. The Hardie spray hose is the safest hose to buy.

Crow's Nurseries

Gilroy **California**

The following is a statement of the cost of fighting frost on 220 acres of the Limoneira Ranch, being the portion that has been protected from many serious frosts within the last seven years and upon which an accurate record has been kept. This cost statement includes interest on investment in equipment, depreciation, care of equipment and labor, and shows the number of times that some of the pots were lighted each year. Probably the property may be justly called about an average of the citrus producing sections of California and includes some flat, cold acres which get more or less frost every year, and extend to higher levels which seldom freeze except in years like 1913.

(See table on preceding page.)

In 1913 the company shipped 317 carloads of lemons which sold for $2316.46 f. o. b. cars California or an aggregate of $734,318.07, and had the grove not been protected, there would have been practically no fruit shipped. As an evidence that there would have been little if any fruit shipped, a portion of the grove on higher ground and freer from frost, which was not protected, was frozen back almost to the trunks of the trees, and not a lemon harvested from this are . And five year old trees were frozen to the ground. A temperature of 20 degrees above zero was recorded for eight consecutive hours within 200 yards of the protected area and where even the small lemons and blossoms were saved. The 220 acre protected area, the cost record of which has been herein given, has been and still is one of the most profitable lemon groves in the state of California, and I have no hesitancy in stating that in my judgment without protection the business would not have been worth engaging in since 1912.

We have come to look upon frost fighting as just as much a part of our expense account as fumigating, cultivating and picking fruit. If the people of the Pomona Valley prefer to depend on the tourist crop for their support rather than their citrus crop, this is their own affair. I am quite certain, however, that if they eliminate the oil pot from their citrus groves that the citrus business in that vicinity will not continue to be very profitable. True, there has been considerable improvement in oil pots in the last few years. Types have been developed that give off much less smoke than the old ones, but even these cannot be operated so as to be entirely smokeless during heavy freezes; and owing to the great increased cost of labor and material, their cost is almost prohibitive. The most approved types cost about $7.00 each.

In conclusion I will say that there is no one connected with our organization who doubts that it does pay to fight frost on the Limoneira Ranch, and I would as soon think of discontinuing the practice of fumigation or irrigation as I would frost fighting.

How Shall We Fight Pear Thrips?

Written for California Cultivator By Ralph deOng

THRIPS caused considerable injury in the Santa Clara Valley last year in March. Now the orchardists are planning a survey to determine what results are being accomplished by various orchard practices in checking this loss. The movement was inaugurated at one of the meetings of the deciduous fruit short courses held in Santa Clara County by the University of California.

It has been proposed that the local fruit associations shall make a thorough investigation of as many orchards as possible, where thrips have caused damage. Full notes will be taken as to the amount of injury which this insect causes, what measures are being taken to check it, whether by sprays or some variation in cultural methods, such as irrigation, or growing of cover crops or by fertilization. Notes will also be taken as to variation of soils, susceptibility of different varieties of fruit and other natural conditions which might have some bearing on the subject. In this way it is hoped to correlate these various factors which might have a bearing on the subject and perhaps shed some light on this perplexing question. There are so many views held on this matter, and with apparent reason, that it is only by a careful survey of a large number of orchards that it is going to be possible to determine any facts or draw inferences. The consensus of opinion of the orchardists present at the above mentioned meeting was that the spray programs thus far offered to the public were inadequate, this applying more particularly to the prune than to the pear, for with the latter fruit it is still customary to spray for thrips. Many orchardists do claim, however, that though sprays for the prune are not practical, certain cultural practices such as fall irrigation, the growing of cover crops, fertilization and the plowing of the orchards, have an important bearing on the subject.

Much work has been done in recent years by the government officials, the University of California and the county officers in cooperation with the orchardists in an effort to control this insect. The federal government maintained an entomological station at San Jose for years where a careful study was made of the life history of this insect and of control measures which might be applicable. For local horticultural officers this problem has been a puzzle which has cropped up intermittently for years. Much the same situation is found in the state of New York, small localities in the pear growing regions being constantly subject to severe loss, although not injurious every year.

The distillate-tobacco spray for thrips was generally advocated by the federal entomologists. Extensive experiments were carried on by these men in Santa Clara and Contra Costa Counties both in prune and pear orchards. In addition deep fall plowing was advocated and some effort made to determine the value of fall irrigation and also of fertilization. A heavy lime spray was introduced by E. L. Morris, county horticultural commissioner of Santa Clara County. This spray was finally changed to include crude carbolic acid. The various suggestions as to sprays and cultural practice have been tried out more or less thoroughly by the prune growers but as yet no program has been adopted as entirely satisfactory. But as orchardists are still subject occasionally to rather severe losses, it seems worth while at this time to take some concerted action to determine what measures should be taken to protect our orchards.

Spraying as a remedy for thrips in pear orchards seems much more satisfactory than when the same work is done in prunes. These varying results

may perhaps be due to the manner of blooming or to the total number of flower buds present. A healthy prune tree will bear a larger number of flowers than will a pear tree and hence can stand a larger percentage of loss and still set a crop. But aside from any theories as to why it is so, there seems to have been a larger amount of success attained by the application of either spray to pears than there has been to prunes. In Contra Costa County and in the pear districts of the Sacramento River especially the distillate and tobacco application has become part of the regular spray program of many orchardists. In the state of New York the tendency seems to be to favor the heavy lime application, the preference seemingly being a lime-sulphur spray with the lime increased to 60 or 70 pounds per 100 gallons. This can be applied just prior to the emergence of the main body of insects and still be effective, while the objection commonly made to the other type of spray is that there is such a very short time during which it can be applied to advantage.

If possible the survey should also be extended to include the pear orchard where spraying is now practiced, not only to determine the value of the spray practice now used but also to bring out, if possible, the reason for the apparent greater susceptibility of the pear.

If the use of cover crops, fall irrigation and other cultural measures are the only ones which are still practiced in prune orchards it seems that they are worthy of further investigation. At least we know that they are building up the vigor of the orchards and thus making it more resistant to the attack of the insect. It is also possible that early or late plowing may have something to do with the emergence of the thrips. We may also find that the presence of cover crops will have a bearing on this subject. This might apply especially to a cover crop that is blooming at the time of emergence. This insect being largely a flower feeder, it is possible that the bloom of some cover crops might attract the earlier appearing insects and thus delay their entrance into the cluster bud when they are first unfolding, this stage being the most susceptible of any through which the flower passes.

Any control measures which are attempted in the orchard are of course subject to a number of complicating factors, such as the condition of the tree and character of the soil, moisture conditions and the number of insects present. In order to get the proper valuation of any method, then, it is necessary to compare the same treatment in a number of orchards and then after making allowances for varying conditions, it should be possible to form a fairly accurate opinion as to what measures are the most satisfactory.

A survey of this type, which would be of any value, should be under the direction of one person or an association and should extend over as wide an area as possible. The same parties should visit all the localities where observations are desired rather than trust to the observations of the individual orchardist for only in this way can a comprehensive view of the subject be obtained. No two people judge alike and also there might be confusion in the minds of some orchardists as to the identity of different species of thrips, and finally, a larger number of reports will be made if a few people make it their business to cover as large an area as possible rather than for the individual to make the observations each one for his own ranch. This does not mean that the orchardists themselves should not assist in the survey or perhaps do a large part of the work, for perhaps there will be little if any means provided for meeting the expense of the investigation. But it does mean that the value of any person's judgment is influenced by the scope of his experience and the number of orchards he visits.

It may be that other localities besides that of Santa Clara Valley, which have been suffering from the attack of thrips, may also care to cooperate in the survey. This would be very desirable as it would not only extend the area under observation but would include different soil and climatic conditions. It would also furnish a comparison of tillage, pruning and other cultural operations. It is hoped that some one of the cooperative fruit associations or other bodies may take up the matter and assist in getting the movement under way in each community. The services of the county farm adviser or horticultural commissioner can probably be enlisted in the movement and also some aid be given by the University of California.

The work should include the determination of the relative amount of damage in orchards with or without cover crops, what crops are used, amount of growth, when planted, stage of bloom, whether the cover crop was irrigated in the fall or not, use of commercial fertilizers or manures, number of years such a crop has been grown and the date and stage of growth of the plant when plowed under.

Any information which the orchardist can give as to past experiences in the use of cover crops and their bearing on thrip injury or emergence should also be secured. The character of the soil should be noted, the customary time of plowing, the thrift of the trees and anything as to the general aspect of the orchard which might make the observation of value. Determine also whether any special measures towards the control of thrips have been taken such as spraying or special farming operations, the latter to include fall irrigation and plowing, pruning or fertilizing experiments or any other practice which has a bearing on the thrift of the orchard or the insect itself.

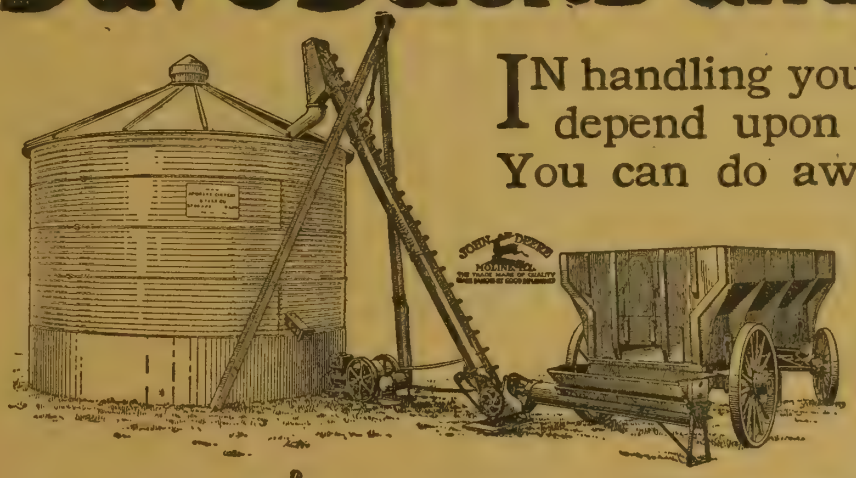
Prof. I. J. Condit of the University of California recently addressed a gathering of fruit growers at Wyandotte, Butte County. Prof. Condit recommended planting of Black Mission figs in that district.

ROULLARD SUGGESTS IMPROVEMENT IN GRAPE STANDARDIZATION

After a season of grape inspection Commissioner Roullard of Fresno County makes the following suggestions for improvement of grape standards and standardization activities:

In order to compel all packers and growers to assume the responsibility that should be theirs, that of fulfilling the standards prescribed, all packages should be marked with a guarantee by the packer that the fruit contained therein conforms to standard and grade.

Marking of containers should be more accurately and definitely prescribed by law.



Fruit in all containers used for shipment, whether packed or not packed, should come within the provisions for standard and grade and should be marked accordingly.

It should be definitely decided and impressed upon packers that the act of packing sub-standard fruits constitutes a violation of the law.

Inspectors should be given authority over rejected fruit if present methods are continued, and the hauling or transportation of such fruit, except under the direction of the inspector, should be deemed an offense. Power or authority, where necessary, to destroy condemned fruit should be given to the inspector.

Mr. Roullard also suggests that all packers and growers meet to definitely settle on the standards they desire.

Save Sacks and Backs

IN handling your grain crop, don't depend upon expensive sacks. You can do away with this big yearly expense item for all time to come. Make the change now. Handle your grain in bulk with a

JOHN DEERE TUBULAR STEEL ELEVATOR

Illustrating the Raising Receiving Hopper

Elevator in position for elevating from the tank into the wagon

The saving you can effect in sacks, time and labor, will soon pay for this equipment. The John Deere Elevator is not a temporary means of meeting the present shortage of sacks—it is permanent equipment that will continue to save you money for years to come.

Ease of Operation—Low Operating Cost—Years of Satisfactory Service Absolutely Assured

It handles all small grains—wheat, oats, rye, barley, shelled corn, flax, rice. It has big capacity—it elevates 15 to 20 bushels per minute—handles the biggest load in six to ten minutes time.

It elevates from the wagon into tanks, granaries or cars. It elevates from tanks or storage bins into wagons. Operated by a team of horses or 2½ H. P. gas engine or larger.

The hopper can be folded up out of the way when the load is driven up. Backing the wagon is unnecessary. Hopper is provided with an adjustable feed—you can quickly adapt the capacity of the elevator to the power you apply.

Built of steel almost entirely, it will not warp or decay. The elevator proper is made of $\frac{3}{16}$ in. steel well-casing, 6½ in. in diameter. It will never wear out. Portable outfit furnished for large ranches where quick transportation is required.

Because of the many years it will serve you and its extremely low maintenance cost, the John Deere Tubular Pony Elevator is decidely the most economical elevator to purchase. It is a real solution of your grain handling problem. Buy now, while your dealer is in position to supply your needs. Save money by getting the best—the John Deere. Elevators carried in stock by John Deere Houses at Portland, Spokane, Seattle, Boise and San Francisco.

Application of the Furrow Manure Method in Citrus Fertilization

From Address by A. D. Shamel before Citrus Institute, San Bernardino

WE WANT to make clear in the beginning of this discussion that we do not want to pose as an authority upon any method of citrus fertilization. Furthermore, our studies have not been and are not now devoted to the problems of the plant food requirements of citrus trees, but are directed toward the study of facts of bud variation in citrus varieties and the work of bud selection in the isolation and propagation of superior strains of the most valuable established varieties in order that more uniform crops of higher grade fruit can be commercially produced. This object can not be attained, no matter how inherently superior the trees planted, without favorable cultural conditions. In other words, good trees without proper culture can not produce satisfactory results. Therefore, in connection with our studies of the behavior of parent and progeny trees our attention has been of necessity called to the cultural conditions under which they have been and are being grown.

Origin of Furrow-Manure Method

Our interest in the use of manure as a means for improving fruit production in citrus orchards in California was aroused shortly after we started our individual tree studies in the Washington Navel orange orchards on the Eureka Ranch near Riverside in 1910. One of our performance record plats was intentionally located in a section of this orchard where the trees were evidently suffering from nitrogen starvation. We wanted to study the behavior of such trees and that of comparable trees in good physical condition. In 1911, the owners of this orchard, at our suggestion, applied ten cubic feet of horse manure per tree to one-half of this plat during May. The manure was broadcasted in the usual way and disked in about two weeks after it had been spread. The remaining half of the plat was not manured or fertilized in any way, as was the case with the remainder of the orchard as a whole. Otherwise the treatment of the two sections of this plat were the same. Obviously, the individual tree records could not be included in our performance-record studies, but were secured and utilized in the comparison of the manured and unmanured plats.

The trees in the manured section of the plat showed a marked improvement during the spring and summer of 1912. The most apparent change was a more abundant development of foliage which had a much darker green color than that of the trees in the area which had not been manured. The quantity of fruit produced by the trees in the manured area showed only a slight increase over that of the trees in the unmanured section. However, the oranges in the manured half of the plat possessed a brighter reddish-orange color, and developed a smoother texture of the rind than was the case with the fruits borne by the unfertilized trees. The most striking difference was in the size of the fruits. Those produced by the manured trees were of very much more uniformly desirable commercial sizes, neither extremely large nor small, as compared with those borne by the unmanured trees. Finally, the eating quality of the fruits from the manured trees was thought to be superior to that of the fruits produced by the unmanured trees.

The tree records in this plat were secured in 1912 and 1913 but only the one application of manure was made. The trees on the manured area continued to show superior conditions as compared with those of the unmanured section for several years. The foliage of the trees in the unmanured plat became lighter in color until it appeared a light yellow. The leaves became so sparse that some of the trees seemed to be almost defoliated. The fruits were extremely small, coarse and rough in color, and almost wholly worthless. The manured trees, on the other hand, developed a fairly dense foliage having a deep green color, and produced superior crops to those borne by the unmanured trees.

During the application of the manure in the manured section in 1911, we could hardly work in the plat, or near it, on account of the strong fumes arising from the freshly spread manure. Even our Mexican assistant objected to working all day under these conditions. During the middle of the day the sharp ammonia smell was almost stiffling. We soon became convinced that under these conditions a great loss of plant food was going on. Subsequent experience in other orchards, such as those of the Corona Lemon Company at Corona, where we were keeping tree records and where manure was being distributed broadcast, emphasized this idea. In such orchards, during quiet days, the pungent odor arising from the freshly distributed manure was very oppressive. It was peculiarly so from the fact that we could not help feeling that much of the fertilizing value of the manure was being wasted. It seemed to us as though money was being thrown away and that the trees were being cheated out of their rightful ration of plant food.

Methods Followed in Brazil

In 1913, while studying conditions in the navel orange orchards of Bahia, Brazil, we were deeply impressed by the fact that every orange grower was also a dairyman. The size of the dairies was usually proportional to the area of the orchard plantings. As a rule, one milch cow or more was maintained for every acre of orange trees. The invariable explanation by the orchard owners of this arrangement was that it was necessary to operate dairies in order to secure adequate supplies of manure cheaply and continuously for use in the orchards. An exception to this rule was a grower of about 100 acres of navel orange trees who for many years had held a contract with a municipal abattoir for all of its refuse which was delivered to his orchard daily and was buried near the trees as soon as distributed.

In connection with each dairy we found a manure pit where the manure and all other available organic material was collected. The liquid fertilizer from the dairy barns and the drainage from the manure pits was collected in cisterns located near by or in connection with the pits. It was distributed, diluted with water, either by means of tank wagons directly to the orchards or was pumped over the solid manure immediately before it was distributed. The manure pits usually had cement floors and walls and were enclosed with screen wire in order to control the fly nuisance.

Surprising to us as was this devel-

opment, the most interesting feature proved to be the method of applying the manure. None of the orchards were plowed. The weeds were usually cut off three times each year by means of heavy hand hoes. We found no plows or other mechanical means for cultivating the orchards, all of the work being done by hand. With this understanding of cultural conditions the method of distributing the manure can be more fully appreciated.

Shallow pits, about two feet wide and 16 inches deep, were dug with hoes. These pits were usually located in the middle of the square made by four trees which were usually planted about 20 feet apart. On hillsides or slopes, the pits were dug directly above the trees and near the drip of the branches, one pit for each tree. A wheelbarrow load of rich, well rotted manure was dumped into each pit. We estimated its weight to be about 100 pounds. As soon as each pit was filled with manure the loose soil which had previously been removed was thrown or pulled back over the manure. Frequently, these freshly filled pits stood a foot or more above the surface of the soil. After a few weeks they usually sunk to about the level of the orchard surface soil.

No other fertilizer than manure was used in the Bahian orchards so far as we could ascertain. Some of the trees were known to have been more than 60 years old at the time of our visit. Many of them had been renewed several times by cutting off the old tops and growing new ones from sprouts. We were told that the trees in one old orchard had been cut back below the head three times and new tops grown from the stumps. We confirmed this account by an examination of the tree trunks, many of which showed plainly the points where the tree tops had been cut off.

Aside from the liberal use of manure and the practice of tree renewal no other tree treatments were practiced so far as we could discover. The many scale pests were evidently held in check by parasites. If trees began to decline by reason of diseases, particularly those diseases resembling gummosis and scaly bark, they were cut back to near the bud union and new tops grown from a main sprout. It should be understood that all of the trees were propagated upon sour orange roots, and that these stocks were apparently immune to the diseases mentioned.

Notwithstanding these conditions the navel orange orchards of Bahia compared favorably with those of California. The older trees were in better condition in some instances than those in this state.

We found a few orchards which had been neglected and where no manure had been applied for several years. The trees in such orchards were almost defoliated and the remaining leaves had the light yellow appearance typical of that resulting from nitrogen starvation.

These and other observations led us to conclude that the use of manure in the orchards of Bahia was primarily responsible for the continuous vigor of growth and fruitfulness of the trees. We left Bahia after six weeks of systematic study of the orchard conditions with this idea firmly fixed in our minds. We regard this observation to be as fully proven as anything can be under the circumstances. Every source of information including our detailed studies and the testimony of the orchard owners confirmed our conclusion as to the importance of manure in maintaining healthy navel orange tree conditions. One of the oldest orange growers of Bahia told us that the use of manure in the manner described was an inherited practice from Portugal and other European countries. Another leader of citrus growing in Brazil who had been educated in Europe told us that burying manure, as practiced in the Bahia orange orchards, was commonly done with many crops in France, Italy, Spain and Portugal. We left Bahia with an increased respect for the ability of the growers, as shown by their success in maintaining productive trees for long periods, in one instance for more than 80 years. We felt, and still believe, that the two most important factors in this achievement have been the liberal and regular use of manure and the practice of tree renewal.

THE biggest reason why your car this year should be an Oakland Sensible Six is the Oakland Sensible Six itself. In design it is the most advanced example of the prevailing principle of high power and light weight construction. In value it represents an accomplishment possible only with Oakland's immense volume of production and its policy of concentrating all its energies upon a single chassis type. In performance it affords that rare combination of reliability and thrift which is the aim of truly efficient engineering. More than 100.000 Oakland Sensible Six cars are now in use. Everywhere, they are delivering the kind of service you have a right to expect from an exceptionally good automobile.

The Oakland Sensible Six Touring Car is unusually roomy and comfortable, having a full 106 inches of body room upon its sturdy and serviceable chassis. Powered with the famous overhead-valve Oakland Sensible Six 44-horsepower engine, it delivers owners mileages of from 18 to 25 per gallon of gasoline and from 8,000 to 12,000 on tires.

MUSCLES OF STEEL

You can begin plowing early with the LAUSON TRACTOR. Early in the season, early in the day. The LAUSON is a good servant. It has muscles of steel and iron. You do not have to bed it, feed it, nor scrape its collar pads. Its shoulders never get sore and it drinks but never eats. And it even stops drinking when it stops working.

With the LAUSON Tractor one man can handle three times as much work because the physical element never enters in.

The LAUSON 15-25
DUST PROOF-ALL GEARS ENCLOSED

is built so that mechanical perfection and ruggedness appear in every detail of construction. It will stand the hard gruelling work of power farming day in and day out without a rest. Sold with or without Christensen starter.

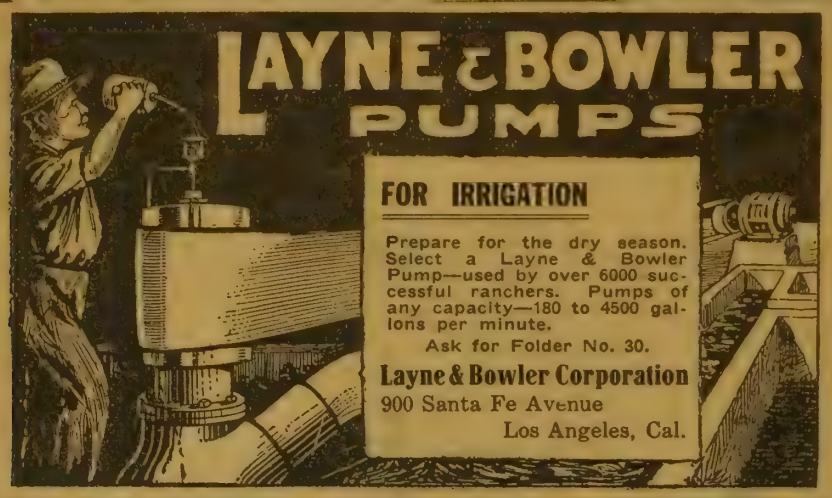
Known as the Pattern Tractor

It is dust proof; all the gears, including the final drive, being fully enclosed and running in a bath of oil.

It has reserve power, the Lauson-Beaver valve-in-head engine being capable of delivering fully 25% surplus of power. There are 24 sets of Hyatt and Timken roller and ball bearings to insure easy running and freedom from friction.

You owe it to yourself not to purchase a tractor until you have seen the Lauson. Taking into consideration its power and durability, it is the most economical farm power unit on the market today. Your nearest local dealer will be glad to demonstrate the Lauson on *your* farm. If you don't know him, we will be glad to send you his name and address.

Builders of Lauson Frost King Engines



For twenty-three years the LAUSON Frost King Engines have been the standard of farm engine excellence—1½ H. P. to 18 H. P.

Agricultural Reconstruction After the War

Address by Dean Thos. F. Hunt of the College of Agriculture, at Riverside

BEFORE entering upon a statement of the method of reconstruction in France and Great Britain it is desirable to state as briefly as possible some of the characteristic agricultural features of the two countries. France has a great variety of climatic conditions. Ethnologically and historically the nation is composed of many human elements which she has succeeded in an unusual manner in welding into a political whole. She has no such communities with such divisions of governmental control as England, Scotland, and Ireland. Her political system lends itself to the promulgation of a unified agricultural policy. Against this must be placed the fact that she has an agricultural population not readily reached through the printed page.

Area and Production

With a land area of 130,000,000 acres, 60,000,000 acres may be denominated arable or cultivated land, 25,000,000 acres are permanently in grass, and an equal area in forest, while 20,000,000 acres are waste land, or otherwise unaccounted for. France has a greater percentage of land in cultivated crops than either the United Kingdom or the United States. The last census (1911) gives the population as 39,600,000, making a density of about half that of the United Kingdom and between six and seven times that of our own country. In peace times it is nearly or quite self supporting from a standpoint of food supply. In 1913 her cereal crops were worth $836,000,000, more than half of this being wheat. Her vineyards occupy one acre out of 25 of the total land area. Her wines were worth more than $300,000,000. In addition she produced from her apples and her pears 575,000,000 gallons of cider and perry. In no other nation of the world are wheat and vines so dominant a feature of the agriculture, nor white bread and wine so important a part of the dietary of its people. If to these features is added the production of wool in its southern more arid and mountainous sections, the sugar beet culture in its northern calcareous sections, and emphasis given to the genius of its people for intensive culture of vegetables, fruits and small animals in its central and most fertile areas, which are also its most populous ones, the high points of French agriculture will be comprehended.

British Agriculture

British agriculture stands, above everything else, for the breeding and raising of domestic animals, which is without a parallel in the world. The British farmer has been molded by and into those characteristics which are necessary to the successful breeder of high grade animals, among which are accuracy of observation and acuteness of judgment. He has been compelled also to think in guineas instead of francs.

Abundance of Grass

The United Kingdom has a great variety of climate, which is generally much cooler and moister, especially during the summer months. British agriculture, however, has reached an unusual adaptation to her natural resources, that is, to the variations in her soil and climate. Out of these facts grows the preeminence of these islands for grass and root crops, and upon them are based her animal industries. As an extreme illustration of the permanency of some of the grass lands, a field was seen at Rothamstead that is known to have been continually in grass since 1620. The British farmers say that it takes 40 years to make a permanent pasture, in support of which they quote the saying, "To make a pasture will break a man; to break a pasture will make a man." This statement has been partially confirmed by the results of the Rothamstead station, which shows that grass land after it has been down four years contains twice as much nitrogen as arable land.

French Spirit

The French are characterized by their artistic sense and their thrifty habits. They have a spirit and dash that has been the admiration, if not the envy, of all nations. Thriftiness is an essential, if not the most important, element in the success of the French peasant, and in saving France from excesses in her cities. The garden is the highest expression of French agriculture. Here beauty and utility meet. The French have a series of words to express what Americans call "home." They are, in ascendancy, un gite, une maison, un home, un jardin.

With the industry and frugality of the French peasant goes a sense of obligation to contracts which makes the risk of credit almost negligible. Even during these war times women left with the whole responsibility of their farms, because their husbands were under arms, have gone ahead and paid off their war obligations without hesitancy or question.

British Repose

The word which best expresses the English character is repose. This repose is sometimes accompanied by a stolidness that amounts almost to inertia. But with it always goes practical common sense. The characteristic British expression, that they will muddle through somehow, means more than a mere lack of foresight. It means that a way will be found to accomplish the desired end when the time comes.

After-the-War Viewpoint

The conditions of agriculture at the close of the war will be very different in the two countries. England had last year the greatest wheat crop since 1878. The acreage of potatoes was the greatest on record by 27 per cent, and that of oats by 23 per cent. France, on the other hand, has decreased her acreage of cereals since the war 27 per cent, and her production 38 per cent. In 1917 her production of cereals was only 53 per cent of the average of the two years preceding the war. Part of this reduction is due to the territory occupied by the Germans, but it is due more largely to other causes, some of which are too intricate to be traced within the limits of this article. England agriculturally considered, had more slack than France, notwithstanding she was much less nearly self contained in her food supplies. Twenty per cent of the population which was engaged in gainful occupations was engaged in agriculture in France, three per cent in Great Britain. More than 5,000,000 males were engaged in agriculture in France before the war, and more than half of them have been under arms. Great Britain's chief fear, perhaps unnecessarily so, is that she will not be able to absorb her army when peace comes. France is making every effort to obtain additional man power at the close of the war. Here in a nutshell, is the difference in point of view of the two countries concerning reconstruction after the war. Great Britain is planning schemes to use more men on the land. France is endeavoring to reorganize her methods in order to get greater results per unit of labor.

Damaged Area

Eleven of the 87 departments of France have been invaded during the war. These departments cover an area of 17,000,000 acres, or 13 per cent of France. Only one of these departments, however, has been completely

occupied at any time. It is roughly estimated that about 5,000,000 acres of farm land have been damaged, of which about one-fourth was in grass. While the commission visited the British, French and American fronts, for the sake of brevity only the northern or British sector will be described.

Northern Section

This area extends from Hazebrouck, Bailleul, Armentieres, and Lille on the north to Amiens, Albert, Peronne, and St. Quentin on the south, and includes the valley of the Somme, in which some of the most destructive fighting has occurred. It is a country of rounded hills, interspersed by flat vales cut by small streams. It is an open country, but little if any more wooded than the Mississippi Valley between Chicago and Omaha, although more of the trees occur naturally. The roadside trees, which are a characteristic feature of the country, are chiefly sycamore and poplar. The open appearance is accentuated by the absence of fences, in striking contrast to the country in eastern England just across the channel, with similar geological formations. The destruction of trees, about which much has been written, is seen here in all its desolation. Roadside trees, 60 to 70 feet high, 12 to 14 and sometimes 30 inches in diameter, absolutely destroyed by the hundreds. Some are blown off, others stand completely defoliated; grim reminders of the deadly destruction that has been wrought in this fair land. To the stranger they are the chief evidence, since the people have gone and the buildings have been destroyed. Only those who knew the country know how many people or what buildings there may have been. But these ghastly trees mutely accuse the Hun of his crime against humanity. In the more northern portion of this section the subsoil is a rather heavy clay. Valleys and streams are fairly numerous. Here are found chiefly farms with homesteads in inclosed fields. Farther south the subsoil is chalk. The valleys are rather larger. Here is to be found the village plan of farming. The reason for village farming in some places, and homesteads in others is due, it is said, to the water supply for domestic use. In the chalk region, which occupies the greater portion of the devastated area between Lille and Amiens, the streams are not numerous, but fairly large. Water can not be readily obtained except near these streams; hence the farmers collect in villages along them. In the areas underlain with clay the country is broken into small streams and rivulets, so that water can be found on every area large enough for a considerable farm. In such regions the homes are scattered about over the country, and the fields are more or less inclosed by fences.

Influence of Women

Except in the recently occupied territory, the main crops were harvested on September 24 and 25. A few women were seen working, pulling beans or digging potatoes, and now and then a quiet old man was plowing, sometimes with one horse, sometimes with two, never more. In one instance one horse was pulling a double plow. Not a single instance was seen of a farm tractor being used during the two days. Aside from these and military activities, on or near the roadways, which at the time was very brisk, the country was completely deserted. The villages did not seem to possess sufficient civilians to till the land. Very few cattle and less sheep, indeed almost no sheep, were seen. In some instances the cattle were herded by girls. There was a considerable acreage of sugar beets, but we were told that less were raised than formerly on account of the trouble of getting labor. In their place, food crops, such as wheat, potatoes and beans, were substituted. Neither Chinese, released soldiers nor German prisoners have been available in this particular section, the chief dependence having been on women. The women working on the farms were not of the land army class, but were farm women such as were in the habit of doing farm work. As has been remarked, the most striking thing about the women of France is their absence of uniform. In 1910 as many women were seen working on the land as in 1918. The French reply to this observation is that this is so because all work in peace times. There is no doubt, however, from the universal evidence submitted, that women have worked harder than ever and that by their exertions France has been saved. Michelet, referring to Joan of Arc, the daughter of a well to do farmer, writes: "Frenchmen, never forget that your country was born of a woman, of her blood and her tears." France is not likely soon to forget these ununiformed saviors of their country, nor are the women of France likely to fail in the future to comprehend their duty to the nation. Since 1871 France added 3,500,000 to her population, Germany 23,000,000.

The Devastation of Europe

In the devastated area which had been captured by the Germans in June and recaptured by the British in August, there were acres and acres covered with shell holes. A typical shell hole is six to eight feet in diameter and two to four feet deep. One of our party counted 14 within 50 feet of where he stood. There are hundreds, perhaps thousands, of acres where the shell holes average 20 to the acre. The desolation of this region is beyond comprehension. It cannot be adequately described. Hundreds of villages and towns have literally disappeared. An officer stops the car and, pointing, says, "Do you see those lumps over there? That is where the village of ——— was." One was, of course, prepared to see that the towns were destroyed, but he expected to find the debris. These towns are built principally of brick. The explosive shells seem to disintegrate them, so that all that is left may be a pile of dirt with brickbats interspersed. When an explosive shell bursts in the air it gives off a whitish or darkish cloud, depending upon whether it is a British or a German "woolly bear." But when the shell strikes a brick building it gives off a reddish cloud, going to show that the bricks were blown to powder. In a country where the farms are scattered about often on back roadways, it is not practicable to destroy completely all signs of habitation, but when the people live in villages and towns along main roadways all that is necessary is to destroy the towns, and the country is as completely vacant as a western prairie before the pioneers arrived. Covered as it is by abundant trenches, dugouts, barbed wire entanglements, shell holes and mine craters, it resembles nothing that man has ever seen before. One of our party expressed it by announcing that he was going to write an article entitled "Farming in Hell." The scene is made much more impressive because the whole area of the Somme is underlain with chalk. Trenching and shelling has brought this brilliant white substratum to the surface. The country is thus ring-streaked and spotted with white against the green background as far as the eye can reach.

Sacred Ground

Stopping before one of a row of great mine craters, 150 feet across, and 80 to 90 feet deep, made by the British in their drive of June, 1916, a British officer remarked quite simply, "This is sacred ground to us. Most of our friends were killed here." An Englishman, 50 years of age, said, "I have only one male relative, a nephew, left. Except for a broken knee cap I should myself have been in the war." This territory has been fought over three times. The destruction is complete. Every once in a while we would stop somewhere and an officer would say:

"This is the town of ———."

"What?" we would say.

"This was the town of ———," he would repeat.

"Where?" we would say.

"Right here."

"But where?"

"You see that bit of brick wall, don't you? That is where the town of ——— was."

Rehabilitation

The rehabilitation of this country will doubtless be a difficult problem. One of the problems to settle will be the direction which the reestablishment is to take. For example, a town of 7000 people which does not have an undestroyed house left, was an industrial place in which a large propor-

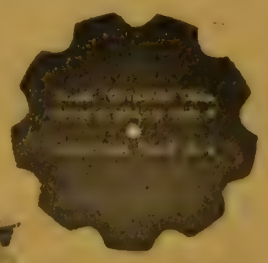
They Fit All Tractors

Clark "CUTAWAY" DISK HARROWS



THIS Double Action Light Tractor Harrow is designed for use with all light tractors. It embraces every important feature of our heavy engine type. Once over thoroughly pulverizes every inch of soil — rear disks splitting furrow turned by front disks.

All CLARK "CUTAWAY" Disks, both cutout and solid style, are made of high grade cutlery steel, *forged* sharp. They dig deeper and pull easier, and without breaking, bending and cracking like ordinary disks.

Write now for interesting free book "The Soil and Its Tillage". Information that you will surely profit by. Ask your dealer about the genuine CLARK "CUTAWAY" tillage tools for tractors and horses.

The greatest crop-raisers you ever used—Planet Jrs.

Planet Jr. implements are so practical in design that they do the most thorough work in the quickest time and with least labor. This is the result of over 45 years of actual farming and manufacturing experience. They are fully guaranteed.

No. 4 Planet Jr. Combined Hill and Drill Seeder, Wheel-Hoe, Cultivator and Plow is a special favorite, and there are more of them in use throughout the world than any other seeder made. Opens the furrow, sows all garden seeds (in hills or drills), covers, rolls down and marks the next row all at one operation. Hoes, plows and cultivates all through the season. A hand machine that will pay for itself in time, labor and seed saved in a single season.

No. 8 Planet Jr. Horse-Hoe does a greater variety of work in corn, potatoes, and other crops requiring similar cultivation, and does it more thoroughly, than any other one-horse cultivator made. It is stronger, better made and finished. Lasts longer. Its depth regulator and extra long frame make it steady-running. Cultivates deep or shallow and different widths of rows.

EKSTEIN NURSERIES Modesto, Cal.

California Ground Squirrels

THE California ground squirrel is going down to history with a remarkable publication as to his life, his habits, his methods of work and destruction and best methods of controlling him. It is the monthly bulletin of the California State Commission of Horticulture and has been given numbers 11 and 12 of Volume VII. It is a 214 page book with a great number of illustrations and six beautifully colored plates drawn by Louis Agassiz Fuertes, America's leading bird and mammal artist. The book is issued under immediate direction of the rodent control division, of which W. C. Jacobsen is superintendent and S. V. Christiersen assistant.

The leading article, entitled "Natural History of the Ground Squirrels of California", is a contribution from the Museum of Vertebrate Zoology of the University of California. The authors, Dr. Joseph Grinnell, director of the museum, and Mr. Joseph Dixon, economic mammalogist on the staff of this institution, carried on the work of preparation in cooperation with the office of the state commissioner of horticulture.

In this monograph the 18 kinds of ground squirrels known to inhabit the state are subjected to critical inspecton from every view point that would seem to offer assistance in developing methods of controlling these, our chief rodent pests. In addition to the facts which have an immediate economic bearing, much information concerning the life histories of these animals is given which at first glance may not appear to have any direct application in the problem of ground squirrel control. However, the authors have pointed out that it is not often apparent in advance which facts will and which will not prove of critical importance in economic work. It is therefore the purpose of the paper to supply full information so that the facts may be available to all who are concerned with the development and application of methods of control.

The following facts are emphasized as being of special importance from the viewpoint of ranchers and all others who are concerned with the problem of ground squirrel control.

Of the 18 kinds of ground squirrels which occur in the state only four are of special economic importance. These are the California (or Beechey), the Oregon, the Fisher, and the Douglas ground squirrels, here named in estimated order of importance.

The Oregon ground squirrel, which inhabits parts of Siskiyou, Modoc and Lassen Counties, though only half the size of the California ground squirrel, occurs in much greater numbers per acre, and since it is a grass eater rather than a grain eater, it comes into sharp competition with cattle interests. These squirrels hibernate for several months each year and on account of this and their grass eating habits cannot be effectively controlled by the methods which have proven effective with the "digger" squirrels (California, Fisher and Douglas squirrels).

The California ground squirrel is the species most widely distributed and occurring in greatest aggregate numbers, there being an estimated population of one squirrel per acre throughout its range, or a total of 32 million squirrels of this one species in the state.

The Douglas, Fisher and California ground squirrels, all belonging to the "digger squirrel" tribe, average one and a quarter to one and a half pounds in weight and are easily able to consume one-half ounce of dry grain or two ounces of green forage at a meal and hence when present in numbers are able to inflict serious loss.

Ground squirrels have strong food preferences, although their diet varies greatly from place to place. Any successful method of poisoning must necessitate the use of a bait acceptable to the squirrel. In several places squirrels have been found to pass up barley altogether for the burs of bur clover, and this suggests a likely way of improving poisoning methods locally.

There is evidence that a greater or less proportion of the digger squirrel population hibernates each winter. The old breeding squirrels are the ones that hibernate; the young of the year are active all winter. These hibernating squirrels are not reached by poisoned grain, and it is doubtful if gas would be effective under these conditions.

The unknown length and irregular course of the burrow is a frequent cause of failure in gassing ground squirrels.

The California ground squirrel reproduces rapidly. The average number in a litter is 7.2, with four and eleven as extremes. One litter per year is the rule.

These animals are very successful in the battle for existence. They are strong on the "come back," and prosper just as soon as any natural check is removed.

Squirrels, like scale bugs or weeds, must be watched continually and dealt with regularly from year to year.

Natural rather than political boundaries should be hewn to in eradication campaigns. A forest ranger does not follow township, county or property lines in constructing firebreaks. He studies the natural lay of the land and fights fire accordingly.

"Squirrel weeks" should be fixed in accordance with the breeding habits of the squirrels, their food preferences, bait available, and probable weather conditions.

Raising Milo in San Jacinto

By W. L. Helwig

Reading your article in January 18th number of the Cultivator describing the method of raising milo has given me the desire to send you an article telling what the soil of the San Jacinto Valley will do with proper care and lots of work.

While not farming on anywhere near as large a scale as the Imperial ranchers do my yield has been so much larger that it deserves being described.

Early in the spring I commenced plowing with a disk plow, but after plowing one day I was not satisfied with the work done as I did not think it was deep enough, so stopped until I could get new 26 inch disks. After getting the new disks I plowed as deep as it was possible. While the ground was still rough I turned the irrigating water on and settled the ground so it was good and firm with no air pockets underneath. As soon as it was dry enough to harrow, put three horses on a two section harrow,

CAN THE MOLINE-UNIVERSAL TRACTOR CULTIVATE? FARMERS FROM FOURTEEN STATES SAY *YES*

These Questions were asked the following farmers who own Moline-Universal Tractors and Two-Row Cultivators. Read how they answer them.

1. Has it been your experience that the Moline-Universal Tractor and Two-Row Cultivator do a good job of cultivating?
2. Will it handle your young corn as well as lay by?
3. Is it as steady as horses, particularly at the lower speeds?
4. How many acres do you cultivate in a 10-hour day?
5. Do you get as good or better corn (or other crop) cultivating with the Moline-Universal Tractor as with horses?
6. Do you find that the tractor will injure the soil by packing?
7. Will it knock down any more stalks at the ends turning than horses?
8. Do you consider the Moline-Universal Tractor and Cultivator a labor saving and economical method of cultivating?
9. How many acres do you farm?
10. How many acres in row crops on which you used the Moline-Universal Tractor and Two-Row Cultivator?
11. What crops did you cultivate in this manner?
12. How many horses or mules have you been able to do away with because the Moline-Universal can cultivate?
13. How many horses or mules do you still keep.

C. R. Barr Wyconda, Missouri	Yes	Yes and do a better job	It is	15-22	No difference	No	Not if particular	I do	205	130	Corn	4	2	I don't think we could farm without the Moline.
C. Hendrix Rushville, Indiana	Yes	Yes	Yes	15-20	As good	No	No	Yes	240	75	Corn	2	5	If we had not had the tractor would never been able to farm as much land.
Herbert Bowman Union City, Indiana	Yes	Prefer young corn	More so	20	Better	No	Not as much	Yes	120	35	Corn	2	3	Could dispose of one more horse.
J. E. Carey Wilmington, Ohio	Yes	Can't cultivate young as fast as old	Steadier		No difference	No	No more if as much	It has been first year	300		Corn	4	7	If I hadn't had the tractor I would have kept 4 more horses, which are a bigger expense than the tractor.
E. E. Fletcher Krum, Texas	Yes	Didn't use it on corn	More so	12-14	As good	No	Yes	Same when in use	500	100	Cotton	*	0	Cultivate ½ more per man. All the work done by two Molines. No horses used.
H. Brun Corning, Kansas	Yes	Yes	Yes	20	Just as good	No	Not as much	Yes	200	120	Corn	6	6	I find the tractor will do all you claim for it, and then some if taken good care of.
Nick Eller David City, Nebraska	Yes	Yes	Steadier	12-20	Just as good	No	No	Yes	210	50	Corn	2	4	Saved enough feed to pay for gas and oil.
Ed. Finnegan Bradford, Illinois	Yes	Yes	Yes	15-30	Sometimes better	No	Not as much as 3 horses	Yes	235	125	Corn	5	5	Rented 35 acres extra corn ground, crops paid for tractor.
F. H. Pence Brinkham, Oklahoma	Yes	Better than team	Better	14-18	Better	No	No	I certainly do	200	50	Cotton and Maize Corn	*	0	I would not farm if I had to go back to horses and mules.
Elmer G. Scheff Nevada, Ohio	Does good job	Didn't use it to finish with	Absolutely yes	15-18		Not if ground is fit for horses	Not as much	Yes	120	30	Corn	2	3	A person doesn't have to sit on implement and let the Moline rest.
M. V. Bartlett Muncie, Indiana	Yes	Yes	Yes	15	Yes	No	No	Yes	230	100	Corn	4	4	It has no equal as a preparer of soil for planting.
W. H. Morris Windside, Nebraska	Yes	Yes	More so	16	Yes	No	Less	Yes	160	60	Corn	3	2	I have ditches in my field that I crossed with it, I never could with horses.
Edward Bilshas Framingham Center, Mass.	Yes	Yes	Yes	10 in small fields		No	Depends on width of headland	Yes on fields larger than 6 acres	73	14	Corn	0	3	Tractor saved a whole lot of time.
Alva West Harpster, Ohio	Yes	Yes	Yes	18	Yes	No	Not as much	Yes	253	45	Corn	8	4	I have done the work of 2 men and 6 horses by having a Moline.
G. W. Beard Waterbury, Connecticut	Yes	Yes	Yes		Just as good	No	Not with a good man driving	No	200	18	Corn	0	4	The only tractor for the East and would advise and certainly buy no other.
Glenn Richard Rutledge, Missouri	Splendid	Yes	More so	16	Fully as good	No	Not as much as a team	I do	200	50	Corn	4	3	Farming without the Moline would be too slow for me.
Fred Pabst Oconomowoc, Wisconsin	Yes	Yes	Yes	9- 11	No difference	No	No	Yes	1400	80	Corn	0	18	That the tractor is satisfactory is indicated by the fact that we ordered a second one.
George Slackslager Lewisburg, Ohio	Good	Yes	Yes	20	Yes	No	Not as much	Yes	140	40	Corn	3	2	It saved a hand and three horses.
W. H. Hamilton Decatur, Iowa	Yes	Yes	Yes	15	Better	No	Not as much	In hands of experienced man	250	120	Corn	5	4	With it we were ahead of the crops.
Chris C. Walker Blythe, California	Certainly does	Yes	More	18-24	Same	No	No	I do	80	80	Cotton	*	0	I would not farm in this country without a Moline.
J. C. Wilmer Des Moines, Iowa	Yes	Yes	Steadier	12-17	Better	No	No	Yes	360	220	Corn	4	6	One man can do two men's work.
Harley A. Mishler South Whitley, Indiana	As good as horses	Didn't have it for small corn	Better a dozen times	20	Just as good	No	No	Yes	185	41	Corn	4	4	I cultivated when neighbors with horses had to quit because of the heat.
Marion Ellingwood Fairmont, Indiana	Yes	Yes	Steadier	17-18	Better	No	Not with right man	Yes	166	60	Corn	4	4	We do all our hard work with the Moline and keep our horses fat on half the feed.
Quincy Gwynn Bellefontaine, Ohio	Yes	Yes	Yes	8-15	Believe so	No	No	Yes	200	40	Corn	3	3	Got my crops in and tended them in good time when it was impossible to get help.
Chas. Lanning Brookville, Indiana	Yes	Yes	Yes	10-12	Yes	No	About the same	Yes	100	35	Corn	3	2	Found your tractor to be what you claim.
J. E. Roberts Platte City, Missouri	Yes	Yes	Yes	15-18	Yes	No	Not with experienced operator	Yes	284		Corn	6	8	Kept cultivator running every day in season.
Chas. E. Bretz Harrisville, Indiana	Yes	Like it best for small corn	Yes	18-24	No difference	No	No	Yes	216	75	Corn	4	4	I have done all jobs on the farm.
Howard Erbank Rushville, Indiana	Yes	No cultivator will	Yes	16	No difference	No	No	Labor saving	240	70	Corn	1	5	I claim the Moline is the most practical tractor if not the only practical tractor for Indiana farms.
Levert Geer Woodstock, Ohio	Very good	Yes	More so	16-18	Just as good	No	No	I do	150	60	Corn	3	2	A Moline for mine every time. It is the only real all work tractor.
L. E. Bloomquist Wausa, Nebraska	Better	Just as well	Steadier	18-19	Better	Not as much	Not as much	Yes	320	160	Corn	6	4	Plowed 80 acres in 6½ days. There was a 3-plow tractor right by my side and I plowed faster and deeper.
Walter Duke Rushville, Indiana	Yes	Yes	Yes	12-20	Better	No	No	Yes	246	75	Corn	5	4	Moline means more, quicker and better work with less help and expense than any other farm power.
M. B. Myers Harpster, Ohio	Yes	Yes	Yes		Better	No	Less	Yes	335	51	Corn	2	5	Tractor is indispensable, has great capacity for work.
Jas. R. Wilson Buckeye, Arizona	Fine job		Steadier	20	Better	Not at all	A little more	Absolutely	140	100	Cotton and Maize Corn	4	2	The new Moline is far and away the best light tractor ever put out.
Hare Bros Wilmington, Ohio	Yes	Yes	Steadier	10-15	No difference	No	Not as many	Yes	180	95	Corn	3	5	We feel we would have to quit farming if it wasn't for the Moline.
J. R. Wicks Guthrie, Oklahoma	Yes		More so	12-14	Can do better work	No	Did at first not now	Yes	320	160	Corn, Cotton, Potatoes, young Peach trees	3	3	Besides cultivating I plowed 110 acres, cut 50 acres of oats, drilled 35 acres of wheat and 20 acres of cane.
Average									247	74.2	30% in row crops	4.1	4.17	* The number of horses replaced was not given. One horse was allowed for each 30 acres.

An average of 50% of all the horses on the above farms was displaced because the Moline-Universal Tractor cultivates—the number of horses was reduced to one for each 59.2 acres. According to United States Department of Agriculture one horse is required for each 20 to 30 acres, and the ordinary tractor does not reduce the number of horses. Remarkable as this showing is, still better results can be obtained. Ten of the farmers above farm 112 acres per horse because the Moline-Universal cultivates and does all farm work. Three farmers displaced horses entirely. Is this possible with any other tractor?

These are not exceptional farmers; many others are getting results equally satisfactory with the Moline-Universal Tractor. And you can do the same.

Remember the Moline-Universal Tractor *does all farm work* as well as cultivating. With it you can plow 9 acres a day, double disc 27 acres, harvest 30 or 40 acres. It has plenty of power for all ordinary belt work. And one man operates both tractor and implement from the seat of the implement.

We build a complete line of implements to work with the Moline-Universal Tractor, all equally as satisfactory as the two-row cultivator.

See the Moline-Universal on display at your nearest Moline Tractor Dealer, or at our factory branch in the following cities:

Atlanta, New Orleans, Dallas, Oklahoma City, St. Louis, Poughkeepsie, Baltimore, Los Angeles, Stockton, Spokane, Portland, Salt Lake City, Denver, Kansas City, Omaha, Minneapolis, Minot, Sioux Falls, Des Moines, Bloomington, Ill., Indianapolis, Columbus, Jackson, Mich.

rode the harrow and set the teeth rather straight, and as my soil is a heavy loam it had a tendency to help form a mulch. The ground then was let lie until it would do to work with a disk, when it was double disked and harrowed as soon as possible, which left the field in good shape. As soon as the ground had warmed up I planted with a common two row corn planter, two and one-half pounds of milo to the acre, but as it again turned cool the seed nearly all rotted and did not sprout. About an acre of the planting which was on sandy soil sprouted and made a good stand and yielded about 30 sacks, which was 3780 pounds per acre.

After I was sure that there would not be a stand on the balance I again double disked the field and followed with a harrow. This destroyed what corn had started as well as the weeds. I again planted on the level the first of June using the common two row planter set so that the rows were three feet apart and using four pounds of good clean seed to the acre. As the ground was not irrigated between the two plantings I had to irrigate the corn when it was about knee high and again when it began to swell and make head. Did not irrigate again until the field was all headed out. As this last irrigation was a thorough one it gave the head a chance to open out, and to anyone not acquainted with the milo will say that each grain has a separate flower which must be fertilized, so each little stem that carries a flower rises up like a hair on a dog's back when it is scared. This gives the pollen that is flying in the air a chance to get to each flower. After the grain was formed I kept plenty of water on the corn so as to keep it growing and never allowed it to slow down or show the least signs of wilting.

I have found by experience that dwarf milo will grow fine without irrigation and do well for a time, will make good size stalks and will open out into the bloom but will stop there if there is not sufficient moisture stored in the ground by improved methods of farming.

Now will come the most interesting part of this article, and I will also say that it was the same to me and I was more than surprised when it was gathered and thrashed. I was figuring on getting two tons of thrashed corn per acre, but this was one time that hard work surprised in the right way, and the result is that my field has averaged me 40 of the common grain bags per acre, which means a little better than two and one-half tons per acre.

Here in a few words is my experience and will be my method the coming year: Good seed to start with, plowing deep early, thoroughly settling the plowed ground, making a good seed bed mulch, watering a week or two after the ground warms up before planting, making rows three feet apart and planting three pounds of good seed per acre. Ground should be kept moist but not too wet until head begins to swell as it will have a tendency to make it shoot up tall and slim which is bound to give a small head. After grain is formed give plenty of water as it needs it to give size and weight to the grain.

A big fight on ground squirrels has been started by the big Chowchilla ranch in Madera County.

A London firm recently bought in Portland $500,000 worth of hops.

Three thousand head of stock are to be sold at Camp Lewis.

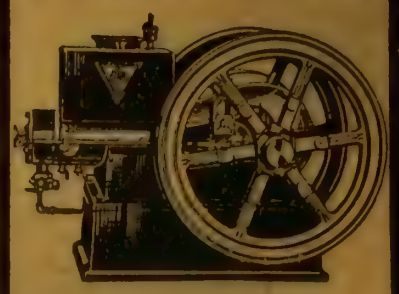
AGRICULTURAL RECONSTRUCTION

Continued from Page 285

tion of the people worked for one firm. Many of the people and many of the industries in these towns have become during the four years established elsewhere. These towns were all developed long before there were any railroads, telephones, or modern methods of manufacturing. While from the human standpoint the reestablisment of agriculture in the devastated area will furnish numerous serious problems, the mechanical difficulty of resuming cultivation is less than the pioneer found in beginning it in eastern United States. Aside from the removal of the unexploded shells, which may or may not prove to be greatly dangerous, the mechanical difficulties, in order to cultivate the land again, are not serious. It were much easier and less expensive to fill the trenches and the shell holes than it was to make them. In some of the early occupied areas this has already been accomplished, and farming is proceeding in a normal manner. The rest that has been given the land will probably somewhat increase its productivity. Doubtless some of the area formerly cultivated should be forested. Some parts could well be given over to the raising of cattle and sheep on a rather large scale, while other parts are well adapted to growing wheat, oats and sugar beets. The rememberment of land, now much discussed by French publicists, is doubtless much to be desired in this section, although it is a problem of great delicacy. There are two opinions about it in France; one is that it should be made compulsory, the other that it is only desirable as a voluntary matter.

Some Factors of Reconstruction

At the outbreak of the war France had approximately 40 million inhabitants; seven million have been in uniform. It is asserted that about 2,000,000 have been killed and that 500,000 will be permanently crippled. It is estimated that there were 250,000 farmers in the damaged areas, of which 20,000 own and operate less than 25 acres. A large proportion of these so-called farms consisted of more than one parcel. It is believed that 100,000 farmers may come back. Some have been killed; others will not wish to come back. This ground has been the battle ground of Europe for at least ten centuries. Some of the inhabitants are getting tired of it.



Depopulation

In some ways, therefore, the devastated area is one of the small parts of the problem. A large land owner puts it this way, "The actual situation in France is dominated by the fact of depopulation. The number of births fell from approximately 1,200,000 in 1885 to about 700,000 in 1914. On account of the decrease in children the number of old people in France is much greater in proportion to population than in other countries. In twenty years the generation now 45 to 70 years will have practically disappeared. The generation 20 to 45 years, which has supported this war and sacrificed itself for the liberty of the world, has been decimated. The generation from one to 20 years will be too small to accomplish all the tasks after the war." While vital statistics were not examined, it is emphatically asserted that the number of births has decreased since the outbreak of the war.

Reparation

The French government which has had some centuries of experience in military matters, has carefully inventoried the damage done in both cities and country, whether done by the Allies or the enemy. The French government expects as a matter of course to reimburse these people for all material damage done to them. The French government recognizes fully that it is responsible for all acts of war. Every trench that is dug on any man's land, every crop that is destroyed, every gate that is stolen, every house or factory that is occupied, no matter whether by enemy or friend, the French government intends to make reimbursement for. The Americans, for example, must pay for every trench they dig, for the rent of every house they occupy, for every field they use, for every destruction which they cause, whether in defensive or offensive operation. To the French any other point of view is unthinkable.

ALPHA

Pumping Engines

A superior line of engines built up to one standard of quality—the highest—from the 1¾ H. P. to 18 H. P. size.

Compare the ALPHA with any other engine. It is much more carefully made — you can see that at once. Alpha Quality means—longer life, better satisfaction, lowest operating cost, no troubles, better results. The easiest starting, most perfectly balanced engine made.

321 Stimson Bldg., Los Angeles, Cal.

Valuation of Damage

There is one point which has not yet been settled—shall the basis of reparation be the value of the destroyed building or machinery in 1914, or the cost of replacement in 1918 or 1919, as the case may be? Since, of course, it is expected to assess these expenses against the German government, it is easy to see why the settlement is postponed. The plan that is discussed, however, is that if the refugee returns, he is to be paid on the actual basis of replacement, but if he does not return he is to be paid upon the basis of the value in 1914, or not at all. However, it is generally agreed that he will be paid not less than the value of the property at the time of destruction in any case.

Cost of Reconstruction

In 1914 the government placed $60,000,000 at the disposal of the prefects or governors, to be used in taking care of needy people in town or country. In 1917 the country voted $60,000,000 for agricultural reconstruction. According to this act the farmer may be compensated for damage done on the basis of 1914 values, provided the damage does not exceed $80 per acre. Each farmer may make a statement of losses incurred, and if approved will be paid within the limit above stated. The compensation may be in actual money or materials. In practice there have been furnished $45 per acre in materials and $35 in money. Up to date $12,000,000 to $15,000,000 in money have been allotted. It has not yet been determined whether the final average value of the damaged area will be $80 per acre, but this is a tentative estimate on the basis of 1914 prices. Assuming the area of farm lands in the damaged area at 5,000,000 acres, on this basis the cost of agricultural reconstruction would be $400,000,000, which is a very small sum compared to the war expenditures during the past four years.

The Horse Bean

By E. R. deOng

THE growing of Horse beans (Broad bean or Fava bean) as a comercial crop in California has been confined to very limited areas; parts of San Mateo, San Luis Obispo, and Santa Clara Counties and small plantings in the Sacramento Valley. The supply from these regions, however, has been so restricted by the attack of weevil and aphids that it is not now sufficient to meet the demand. There are many places in the central coast regions of California, as well as in the interior, where this bean might perhaps be grown profitably at present, at least for a few years. In new localities the weevil would not be so abundant as in the places where the crop has been grown continuously for years. By experimental planting it may be that regions will be found in this state where, by using clean seed and regulating the planting date, this bean may be grown continuously without the necessity of artificial control measures and yet be free from extensive weevil injury.

The range of planting dates, as is commonly practiced, for the regions of cool summers extends from January to March, although it has been planted as late as May in order to avoid weevil injury. Late plantings are however more subject to aphid injury during the summer months and also to damage from rain at harvest time. In the interior valleys this bean may be grown as a winter crop, being very resistant to frost, the planting being done in October or November. This program offers the possibility of a double crop system, the land being irrigated after the Horse bean is harvested and some of the small varieties of beans then being planted.

The weevil which attacks the broad bean being a different species from that feeding either on the small varieties of beans or peas there would probably be little danger to the crop until the broad bean weevil was introduced. By careful fumigation of all seed beans that are imported, and of any locally grown beans that show the least sign of infestation, the spread of the insect would be restricted and even if the weevil did become established the prompt removal of the crop immediately after harvest to warehouses several miles distant, cleaning the field of waste beans by stock and the fumigation of all beans remaining in the district, will do much toward holding the weevil in check. In this way the percentage of weevil infestation might be kept down to a point where the beans could be sold without restriction.

Marketable beans sold this year at five and a quarter to six cents a pound and as the usual yield on good soil is from 15 to 30 sacks to the acre, the crop is quite profitable. Much of the output is shipped to the eastern states, although small amounts are consumed locally, both dry and as a green vegetable. In parts of Southern California the Horse bean is grown as a cover crop, its resistance to frost and heavy tonnage making it very desirable. The crop is usually grown in drills with the rows about the same width as for the small varieties. It is satisfactory as an intercrop for young orchards or grown as a field crop.

This year's crop in the older Broad bean districts, was so weevily that a large proportion of it when offered for sale as human food was seized by officers of the federal food and drug commission. The ruling of this board was that the presence of weevil makes it unfit for human food, so that any lots offered for sale which exceed 15 percent infestation are subject to seizure. The shipper whose beans have been seized has the alternative of hand picking the lot or selling it for stock feed. The percentage of weevil infestation may be reduced below the 15 per cent infestation allowed by hand sorting the beans, picking out the weevily ones. This costs from one to two dollars a sack. As stock feed weevily beans brought the same price this year as barley so that the attacked bean is far from being a waste crop. They are usually ground when fed to cattle or hogs. This bean is also a good poultry food, it being ground fine and mixed in the mash or cooked or fed wohle.

LADYBIRDS CONTROL FLUTED SCALE IN THE MISSISSIPPI DELTA

The early experience of California in the control of scale insects by beneficial ladybirds has been brought into play with good results in the Mississippi delta region to the end that the fluted scale which threatened that region has been effectively repressed.

Cooperating with the city of New Orleans and the state of Louisiana, the bureau of entomology, United States department of agriculture, completed during the year the control of the fluted scale in New Orleans and neighboring places. This was accomplished by the propagation and liberation of thousands of the natural enemy of this scale insect, the Australian ladybird. More than 300 colonies of the ladybirds were liberated over an area of 40 square miles. The distribution also was extended to the known outlying infestations of the fluted scale in Louisiana, Mississippi, and Texas.

LEAVING HIM AT SEA

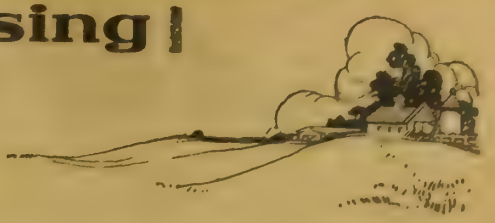
"Could you do something for a poor old sailor?" asked the seedy-looking wanderer at the gate.

"Poor old sailor?" echoed the lady at work at the tub.

"Yes'm, I follered the wotter for 16 years."

"Well," said the woman, after a critical look, "you certainly don't look as if you ever caught up with it."

Then she resumed her labors. —Ideas.



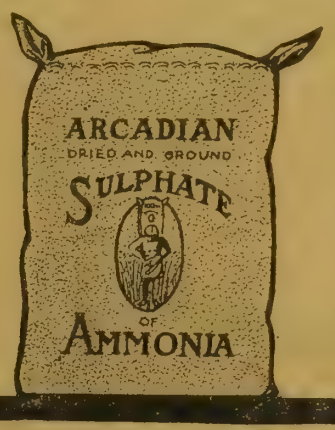
ROASTING HIM

As William Faversham was having his luncheon in a Birmingham hotel he was much annoyed by another visitor, who, during the whole of the meal, stood with his back to the fire warming himself and watching Faversham eat. At length, unable to endure it any longer, Mr. Faversham rang the bell and said:

"Waiter, kindly turn that gentleman around. I think he is done on that side."—Everybody's.

The California Citrus Protective League has elected E. F. Lyon of Redlands president.

Top Dressing Talks No. 6



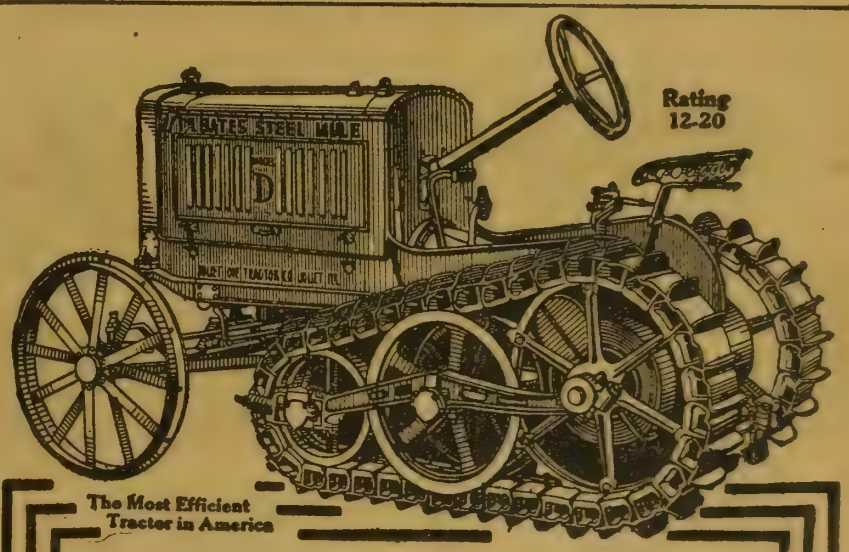
What amount of ARCADIAN Sulphate of Ammonia should you apply? That is very largely determined by conditions of soil, crop and climate. Generally speaking, 100 to 200 pounds per acre will prove profitable on field, truck and orchard crops. For well grown citrus trees as much as 600 pounds per acre may be used with profit, providing the phosphoric acid and potash content are sufficient.

The best advice is to try a moderate application first, watch your results carefully and be guided by them. In this way you will learn whether your maximum profit is at 100, 200 or 300 pounds per acre, or even more.

Don't forget that good farming requires an occasional application of lime.

Arcadian Sulphate of Ammonia

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in U. S. A.



For sale by Hawaiian Fertilizer Co., Ltd., San Francisco; Pacific Bone, Coal & Fertilizing Co., San Francisco and Los Angeles; Pacific Guano & Fertilizer Co., San Francisco and Los Angeles; Agricultural Chemical Works, Los Angeles; Western Meat Co., San Francisco.

The California Cultivator

Weekly—24 to 36 Pages One Dollar per Year

The Deming "Century" for simplified spraying. May be mounted on side or head of barrel. Pump set low on barrel with cylinder submerged. Removal of 4 bolts only, makes valves and plunger accessible.

"A Barrel of Profit"

THE man who has never sprayed thinks of a sprayer as an expense—the man who has tried it knows it is a money-maker.

Here's the outfit for the beginner—big enough to do a good job fast, marvelously simple in design and mechanism for easy handling, and reasonable in cost—a first-prize winner in a National contest. Back of it are 40 years of specialized study on the design and building of pumps.

Send for the 1919 Deming Catalog—32 pages—free on request. 10c in stamps or coin will also bring an 80-page text-book on spraying.

This Month in the Vegetable Garden

Southern California

Written for California Cultivator By D. F. Reichard

WE ARE entering now on the busiest planting month of the year. The weather conditions have been very satisfactory. The rains have not been heavy but they have been well distributed and those who have taken advantage of them and worked their ground as has been suggested from time to time can not help but have their soil in fine shape for the reception of seeds and plants. During this month it is safe in most places to venture plantings of the more tender crops.

The hardy vegetables like carrots, beet and cabbage, that were planted late last fall, are just maturing, so to have a continuous supply one must get new beds of these started. Use the quick maturing varieties if what you have growing is not sufficient to last for another three months, the time required to mature main crop varieties. We would recommend for quick results French Forcing carrots, Extra Early Egyptian beets, Six Weeks or Milan turnips, Scarlet turnip, White Tip radish, Amsterdam Giant spinach and Wonderful lettuce. Planting onion sets will give quicker results than from seed. For the main crop use Chantenay carrots, Eclipse beet, Purple Top White Globe turnip, kohl rabi, parsnips, salsify and onion seeds. All of these being root crops require deeply worked soils for best results. For parsnips, salsify and long carrots the English gardener works his ground to a depth of not less than two feet, and the results are those long, smooth, fine flavored roots that we see pictured in European catalogs.

Having your ground in good shape before planting is the foundation of a successful garden. Plant all your stuff in rows so that the garden can be easily irrigated and cultivated. Always be sure to have the seed in damp ground when planted even though they are covered considerable more than four times their diameter, which is the proper depth to plant where the seed bed conditions are perfect. By getting the seed into well prepared damp soil the ground will not have to be wet before the seed is up, whereas if the ground has to be wet to make the seed come up there is considerable damage from making a crust over the surface that the seed are not able to break through.

Of the more tender or summer growing vegetables any of them may be planted with safety during the latter part of March in all but very cold sections. During the first part of the month considerable risk is undertaken when plantings of tender stuff are made anywhere but in naturally warm sections. Where conditions permit make plantings of Canadian Wonder and Ventura Wonder wax beans; Heath's Early or Golden Bantam sweet corn; White Rose potatoes, and squashes and melons. Set out plants of tomatoes, peppers and egg plants. Plant peas the early part of the month. We do not recommend them later because the weather gets too warm before they mature and peas do not do well in warm weather. Put in the main crop of onions this month for dry onions for winter, using Australian Brown, Yellow Danvers or Southport White Globe.

Get your pump into working order because this is the critical time to use it, just when the insects are hatching and before fungi develop. Lime-sulphur solution is the best combination spray to use at this time although for apple and pear trees Paris green or arsenate of lead should be added to this spray or to Bordeaux mixture, and spray when the trees are coming into bloom and again just as they finish. Rinse the pump well each time it is used.

Northern California

Written for California Cultivator By A. R. Gould

THE month of March is about the busiest month of all as with it comes the opportunity which spring offers and we are able to make successional sowings and transplant many of the subjects we sowed the previous months. New plots should be prepared and sowed or planted out, always reserving space for the months to come. Usually California grown vegetable seeds—which by the way are known the world over—are noted for their high percentage of vitality and as a result it is not necessary to sow thickly as it not only means waste but retards the early growth of the seedlings as it means a crowded condition. A word of warning to our readers in buying seeds: Never buy cheap seed or "job lots" put up by some firm who were afraid to print their name on the packet, as the reliable seedsman is proud of his seed and is also interested in results. Furthermore, most of them spend lots of valuable time and money in testing their seed throughout the season, which is also a duty they owe to their customers, as it is essential for the success of all concerned. Those who sow poor seed are wasting time and good land and for this there is no excuse.

Regarding a chemical fertilizer and one which brings results, we recommend sulphate of ammonia. It is excellent to use in the vegetable garden. Apply this broadcast and work it in with the cultivator as soon as possible this montth. The quantity to use will depend largely upon your soil conditions. If your crops were very poor last year and you are convinced that your soil is poor use at the rate of 100 to 150 pounds per acre. We have used this with success under various conditions and the writer has seen quick action.

Tomatoes

It is not too early to prepare quarters for sowing seeds of this crop and a rough frame or hot bed should be constructed and the top protected with cheese cloth. The soil should be somewhat sandy and after sowing the seed should be watered in. Early Detroit, Chalk's Early Jewel or John Baer are all splendid early varieties, while for a later canning variety, San Jose Canner is the best. The plot should be well trenched and in order for planting out some time next month. Avoid using the same plot you used last year in case a few diseased fruits infected the soil during the winter, which a fugous disease is likely to do.

Peas

Continue to make a monthly sowing

of Little Marvel, Stratagem or Abundance and see that these do not suffer for lack of water. In the warmer sections and on the hillsides in Alameda County the early peas will now be making considerable headway and it will be necessary to keep the cultivator busy between the rows.

Cabbage

Seeds of Early Drumhead, Copenhagen Market or Large Flat Dutch may all be sown this month on a border or bed of well prepared soil, after which they must be transplanted to well manured and deeply trenched soil. A small packet of seed will supply quite enough plants for the average small home garden.

Leeks

These if sown as advised last month may be transplanted to other boxes three inches apart, towards the end of the month.

Carrots

Sow on well prepared soil French Forcing or Long Orange in drills 18 inches apart, thinly.

Onions

Transplanting of early and main crop varieties may be made this month on richly prepared soil. Where root and wood ashes are obtainable this should be applied broadcast and worked in thoroughly.

Celery

Seed should be sown in boxes of sandy soil. Golden Self-Blanching and Giant Paschal are good varieties. Trenches for planting out in due course should also be prepared during the next two months. Celery is deep rooting, hence these trenches should be deeply manured.

Lettuce

Strong seedlings should be selected for transplanting towards the end of the month from last month's sowings.

Potatoes

This is the month when we can safely plant in our section. Little is gained by very early planting and it will also be advisable to secure your seed tubers from your seedsman (certified as free from disease) and these can then be placed in a shallow box near the window to encourage sprouting. Select small tubers for planting or cut the large tubers into sections having two or three eyes. Avoid planting in stiff heavy soils as it requires a rich sandy loam in which to thrive. Plant the tubers in rows about five or six inches apart, after two weeks' sprouting has taken place in the boxes. The soil should have been previously deeply trenched with farmyard manure. Early varieties we advise planting are Early Rose, British Queen or Irish Cobbler, and for the main crop Oregon Burbank and Great Divide. About eight pounds will be required to plant a row 100 feet in length. It is very advisable to dip the tubers in a solution of formalin before planting to prevent any development of disease.

Radish

Make a sowing of Early Scarlet turnip and Half-long on rich soil. Sowings may be made every two weeks.

Flavoring Agents

Mint, thyme, etc., may be transplanted or existing clumps divided now or seed of any of these herbs may be sown on a warm border.

Rhubarb

This is a paying crop and if planted in richly manured soil will give results. Strong clumps of Giant Winter and Victoria may be secured from your nurseryman and planted without delay. Plant in rows three feet apart. Dress existing roots heavily with farmyard manure.

This Month in the Ornamental Garden

Northern California

Written for California Cultivator By A. R. Gould

MARCH brings us still more work in this department, as we must prepare for summer displays and to keep up a succession it is necessary to make several sowings during the coming months.

Enemies of Plants

There are numerous enemies of plants everywhere, both as fungous diseases and insect pests. Among the most important of the latter are snails, slugs, caterpillars, mites or red spider, scale, mealy bug and last, but not least, the green fly, or aphis. These latter increase very rapidly. Prof. Huxley has stated that the tenth brood of aphis would contain more animal matter than the population of China. These very destructive creatures suck the juices of the young tender shoots of plants where they may be found on sweet peas, roses, stocks and other flowers. A solution of nicotine mixed with a little soap, sprayed at intervals will generally prove an effective method to adopt. Paris green or lead arsenate will prevent the ravages of the caterpillars if sprayed on the plants in time. Sulphur should be used against the mite or red spider and constant vigilance day and night is required to destroy snails and slugs.

The Flower Seed List

If you have not yet ordered your flower seeds for the season you should study the list without delay as the seedsman's stock is larger early in the season.

Flowers for Partial Shade

The question is often put, "What can I grow in partial shade?" and here we may mention the following: Lilies, pansies, viola, wallflower, verbena, sweet william, begonias tuberous, nigella, or love-in-a-mist, columbine, marguerite, calceolaria, and campanulas, among which are the Canterbury bells. You may secure bulbs of the lilies and seeds or plants of the others mentioned and use them to beautify the situation above referred to.

Flowers for Shady Places

Even here where many have despaired of improving such a location one may use cinerarias, primulas, forget-me-nots, violets, valerian, begonias fibrous, and mignonette. For ground cover under oaks or other trees having dense shade English ivy and vinca are both ideal to use.

Sowing Annuals Broadcast

For a bright color display sow the following seeds broadcast in the open ground after the soil has been well prepared. The seeds must be well raked in: Poppy, Shirley; linum or scarlet flax; Tagetes, Golden Gem; Dimorphotheca, orange daisy; candytuft; white livonia; viscaria and balsam. Any of these may be sown in this month direct to the flower beds or borders, their permanent quarters in a few weeks after germination. However, they will need thinning out.

Some Fine Buddleias

These are large evergreen shrubs and have of late become very popular. Recently the writer saw a beautiful white winter flowering variety quite distinct from the others in that it was also very fragrant. B. magnifica is a large deep purple flowering type of variabilis. B. globosa, having orange yellow globe shaped flowers and a compact form of bush growth, is also worthy of notice, and B. madagascariensis, also orange colored, has long spikes of flowers, the plant being of very vigorous growth.

All the above mentioned should find a place in the garden and they may be easily propagated from cuttings or slips placed in sand in a warm frame.

Fragrant Flowering Shrubs

Many gardens lack fragrance, which is a great loss, but among those shrubs which are very fragrant we should advise planting Daphne, pink and white varieties, abelia, lilacs and syringa.

The Perennial Border

Work connected with the perennials should be completed this month. Dividing the larger clumps and transplanting should be performed without delay, and any new plants raised from seed planted in their respective groups, oriental poppies in solid groups of color, phlox, golden glow, a tall plant for the background, hardy asters in variety, pentstemon, sweet williams, polyanthus and heuchera effectively grouped provide a summer and fall display to which we might add the anchusa, geum and gaillardias, with a border edging of double daisy, and violas, white and blue.

STYLEPLUS CLOTHES

To the boys going back to civilian life

You will need new clothes almost the first thing.

If you were not a Styleplus wearer perhaps these facts will convince you:

—We concentrate our volume which enables us to manufacture at low cost.

—We attach a sleeve ticket on every Styleplus garment at our factory which plainly marks the price.

—Styleplus Clothes have *earned* the reputation of always being exceptional in value and in style.

—Styleplus are for the men who want a reliable quality—and real style—in the medium price range.

Southern California

Written for California Cultivator

THERE are so many spring months in California that it is hard to tell which is the most important. Any spring work which has not been done in the preceding months should be cleaned up during March. Lawns are now getting greener and handsomer than ever and need additional fertilizing. Bone meal and tankage are two good lawn dressings. Uncultivated ground which is covered with weeds should be spaded at once. One may still plant sweet peas during the earlier part of the month. One may well apply manure during this month. The flies are not so bad as when it is spread around during midsummer. The mulch checks evaporation and puts the soil in excellent condition.

Finish sowing the annuals, or rather, continue for one may sow annuals practically the year around, but make this the most liberal planting month; asters, balsams, coxcomb, cosmos, larkspurs, marigolds, nasturtium,s zinnias, and dozens of others; especially plant nasturtiums. They will stand for neglect and are a fine soil cover and usually grow rank enough to prevent weeds from getting a start. Use these in out of the way corners.

Cuttings. This is a good month for making cuttings, and don't forget the homely geranium. Nothing more gorgeous can be shown than the effect of massing some of the bright colored geraniums, and if water gets short in midsummer they will stand for much neglect.

Then there are poinsettias, begonias, carnations, fuchsias, heliotrope, marguerites, salvia, and later in the month, chrysanthemums and other plants which are grown from cuttings or rather by division. In this class are the Shasta daisies, Golden Glow and dozens of others which will occur to every gardener.

The old callas which have been frozen down should be encouraged. We have never seen anything give color and mammoth size equal to a half a dozen handfuls of bone meal thrown around calla plants. We have grown leaves four to four and a half feet in length, but remember they take lots of water and a bit of shade in midsummer is not unacceptable. New callas may also be planted, as may cannas, dahlias, tuberoses, tigridias, and don't forget that glory of the garden, gladioli. Loosen the soil around the amaryllis and give them a good mulching. The true amaryllis, that is the pink midsummer or early fall bloomer, gives wonderful cut flowers. The spring blooming amaryllis, or hippeastrums, will appreciate quick acting commercial fertilizer.

Those roses which were pruned last month should now be given abundance of water and fertilizer. We can force Christmas bloom by proper midsummer handling of these plants, but the true glory of the rose is shown by its natural spring bloom.

In sections where rain has been a bit scarce don't forget to lay the hose where it will run for several hours on the roots of the wistaria. It is time for it to be getting ready for the wonderful bloom which it will give a month or two later.

Avery Motor Cultivator

You Can Also Cultivate With Motor Power

The AVERY-MOTOR CULTIVATOR and PLANTER has been in successful use in the Middle West and Southern States for FOUR YEARS, planting and cultivating COTTON and CORN.

We have made some special changes in this machine so as to especially adapt it to California Crops.

Our machine is NOW especially equipped to cultivate—

4—30-INCH ROWS OF BEANS,
8—18 TO 20-INCH ROWS OF BEETS,
2—36 TO 44-INCH ROWS OF COTTON OR CORN.

With an AVERY MOTOR CULTIVATOR you can cultivate from 18 to 30 acres per day, when it is too hot to use the horses.

Motorize Your Whole Farm

Also investigate the Avery Kerosene Tractors, built in seven sizes—a size for every farm. You can plow, disc and harrow your land with a tractor and plant and cultivate your crops with an Avery Motor Cultivator. All of these machines, together with a complete line of grain separators are fully described in the 1919 Avery Catalog. Come in and look over our display of motor cultivators and tractors and get a copy of the Avery Catalog.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

When Are Eggs Fertile?

Our hens have had no rooster with them for a month but now have him with them again. How long will it be before eggs are fertile? When placing a rooster in the flock for the first time when would eggs be fit to set? How long will eggs remain fertile after removing male bird? Would a cross on Plymouth Rock and Cornish Indian Game make a better market fowl than straight game?—Subscriber, Lakeside.

Generally speaking, fertility cannot be counted on till the male has been with the hens about two weeks, but in this case, since he is not a stranger, you should have a reasonable per cent of fertility by the end of the first week. Tests have shown that some eggs are fertile as early as four days after mating, and the majority are fertile in eight or nine days, but there are always some hens in a flock that are slow in getting acquainted, so, when hatching eggs are to be sold it is better to wait two weeks if the male bird is new in the pen. Fertility lasts five or six days after the male is removed, and sometimes longer.

A cross of Barred Rock and Cornish ought to give a market bird that would reach market size a little sooner than straight game, though the color would not be as satisfactory as a cross of Cornish on R. I. Red. A well known Cornish breeder tells me that his chicks from a cross of Cornish male on R. I. Red hens reach one and a half pounds in six weeks. Game breeders claim that there is no better table bird than the game, but the game does not grow quite as rapidly as its crosses with other breeds.—J. A. K.

R. I. Reds or Plymouth Rocks

Which are the best all 'round chickens to raise, both for eggs and meat? Which is better, Rhode Island Red or Plymouth Rock?—Subscriber, Del Sur.

I should not dare to say which is better, for both have their admirers. Californians generally consider the Red the better layer, but Barred Rocks have made some splendid records in the egg laying contests. On the other hand, it is pretty generally agreed that the Rock is the better breed for meat. It is just a question of which you want more, eggs or meat. No breed is equally good for both. Probably a good laying strain of either Barred Rock or Orpington comes as near being the ideal dual purpose fowl as you can find.—J. A. K.

Who Is Breeding Buff Ducks?

Please give me the addresses of two or three people who are breeding a good grade of Buff Ducks. I know of the Ferris Ranch, Pomona; they have no stock for sale. There do not seem to be many people breeding them, judging by the dearth of for sale notices.

I find no one advertising Buff Ducks except the Ferris Ranch. If any reader of the Cultivator has them, now is a good time to let it be known.—J.A.K.

Rabbits Have Indigestion

What cure is there for young rabbits that get poor and die. The apparent cause is white spots on the liver and very little gall. I am feeding dry alfalfa, rooted barley with a little green grass and a few carrots at times.—Subscriber, Vallejo.

The trouble is caused by indigestion, may be because of feed or inherited disposition. Feed corrective foods such as a variety of weeds, barks of orange, apple or apricot sprouts. Feed sparingly yet regularly. —W. D. W.

Egg-Eating Dog

I have a dog five months old that eats eggs. What can I do to break it of the habit?—J. H. Armstrong, Stockton.

Personally, I don't think a dog belongs on the same ranch with chickens. If you break him of eating eggs you will also have to teach him to let your young chicks alone. However, I do not see why an intelligent dog cannot be trained not to eat eggs or catch chicks just as easily as he can be trained to stand on his hind legs and do other useless things. Why not try punishing him every time he is found in the chicken yard? A cat that has been accustomed to chicks all its life will play among them and never think of touching one. Surely a dog has as much intelligence. If it has not, there is only one thing to do.—J. A. K.

Tanning Rabbit Skins

How are rabbit hides tanned for fur?—Subscriber, Vallejo.

Remove all flesh and fat from skin while fresh. Dissolve one quart common salt in one gallon water, add one ounce sulphuric acid. Three days in this solution will tan baby rabbit skins, 21 days mature skins. Six weeks' soaking will not injure either, and it is best to take time. When tanned, remove from first solution and wash in mixture of five gallons water and ½ pound sal soda. Hang skin in shade for about 24 hours. Rub and work skin to make soft and pliable, then roll up in sack to keep from drying. Repeat this process several days until skin is dry and soft. Don't permit skin to become dry and stiff until work is completed.—W. D. W.

Is Rabbit Raising Profitable?

Can rabbits be raised profitably for

This is the Time to Fight THRIPS

Get thrips now as they come from the ground to lay their eggs. A million dollars' worth of damage—that's what they do every year to California prunes, cherries, pears, apricots, etc. And all because they're not killed in time.

This is the month when the adults emerge from the ground to embed their eggs in the first opening bud. Kill them in this egg-laying stage by **spraying with**

Miscible Oil No. 2 for Thrips

—high gravity oil especially prepared to control thrips, of great penetration and quick evaporation—will not injure the tenderest buds. Miscible Oil No. 2 is a Universal Brand product, always uniform. It gives right results.

Don't wait for your trees to bloom—or they may never bloom. Thrips come without notice, stay only a short while, and are gone; but they get in their work of destruction in a few hours.

Hold your materials in readiness. Be sure you have enough on hand for your entire orchard. Send in your order today.

Our entomologist, Paul R. Jones, is an expert on thrips. He can tell you how to fight them successfully. Write to him now about your own peculiar problems — you get personal service and—it's free.

UNIVERSAL BRAND
ORCHARD SPRAY

the market at the present prices of feed? If so, what breed would you recommend for that purpose? At what age and weight should a young rabbit be placed in the market at the most profit and what is the average cost to produce a rabbit for the market?—Subscriber, Berkeley.

Yes. The writer can prove this by his own experience and that of many members of our local pet stock association. One can waste money or save money in buying feeds. One of our members saved 35 cents per sack on roll barley by shopping around a little last week. One member bought his hay loose at $11.00 per ton and another stood and looked at it longingly one day for he was then buying his by the bale and paying $26 per ton. The question presents many phases and is one that is often discussed in our club meetings, and it would pay you to join your local club and have a part in these talks.

Belgians, New Zealands or Flemish make good market stock. The age for killing depends on the demands of your market. Some want fryers, some broilers and some roasters. The average cost per pound can only be determined for you by a test of stock fed on the foods obtained in your market for a certain period of growth. Take a doe with litter just born and estimate cost of food for three months and then weigh stock and you will know accurately. It generally runs about from 11 cents to 15 cents per pound. You will find it very helpful to read carefully some good rabbit book where these and many other questions are discussed.—W. D. W.

Beans for Poultry Feed

Can you tell me how beans at six cents per pound would compare in feeding value with corn and barley as feed for laying hens, if I cook the beans.—Subscriber, Monterey County.

Beans at six cents a pound are considerably more expensive than corn or barley and much less palatable. For some reason hens do not take readily to a bean diet. If the beans are ground or broken and mixed with other grain in such a proportion that the hens do not notice them, they will eat them, but they prefer other things. I have in mind a friend who bought a quantity of weevilly beans thinking they could be cooked and fed to his hens, but the hens have steadily refused them unless they were thoroughly disguised. If I had the beans I would try to fix them so the hens would not know what they were eating, but I would not buy them at any price.—J. A. K.

Proper Ration for Poultry

Please tell me what is the matter with my chickens. I had a fine show rooster and knew the flock from which he came and know there wasn't a sick one among them, but after I had him about two or three weeks he became squatty and wouldn't wander around for feed, and his droppings were a very light brown with a tinge of very light green and then on top was always a big lump of white. This was quite hard. His comb and head turned very dark but never got black. My chickens are in an old chicken yard but there have been no chickens there for four years. I have guessed it to be cholera as the trouble seems to be contagious. A hen died yesterday and I have four hens setting and their droppings are turning the same. Will the little chicks be all right if I take them away from the hens as soon as out of the shell? Is there a cure? What shall I do? The chickens have all the green grass and alfalfa they can eat and table scraps. The setting hens have wheat.—Subscriber, Helm.

Cholera is a very rare disease in California and is characterized by a yellow coloration of the urates, or white, solid portion of the droppings, which is not in accordance with your description. I think your chickens have enteritis or dysentery, due to wrong feeding. You say they have green grass and alfalfa and table scraps, all but the sitters, which have wheat. If, as this seems to imply, the general flock has no hard grain and no mash, nothing but greens and table scraps, which are quite likely to be more or less spoiled, the trouble is easily explained. Chickens must have some hard grain to keep their digestive organs strong and active. They must also have grit for grinding the grain. Table scraps are all right once a day, but they should be cooked, along with potato and apple parings, waste cabbage leaves, etc. Boil them till soft, and then thicken them with bran or middlings or with the commercial dry mash, which ought to be before them in hoppers all the time. This mash is best given early in the afternoon, though some very successful feeders give it at night. Sprouted oats or barley in the morning, with fresh greens at noon, the moist mash at 2 o'clock, and a mixture of barley, milo and wheat at night makes a good, wholesome balanced ration.

To cure your sick chickens, get them onto the proper ration first. Second, give the whole flock a dose of Epsom salts, a teaspoon to each bird, dissolved in water and mixed in the moist mash. Mix powdered charcoal with the mash. Third, Dr. Salmon recommends this treatment, which will not cure your chickens unless they are properly fed, but which may hasten their restoration to health. He suggests either one of the following:

1. Subnitrate of bismuth, three grains; powdered cinnamon or cloves, one grain; powdered willow charcoal, three grains. Give twice a day mixed with food or made into pills with flour and water.

2. Subnitrate of bismuth, three grains; bicarbonate of soda, one grain; powdered cinchona bark, two grains; mix and give three times a day in a paste made with rice flour. When diarrhoea is arrested, bismuth and soda are no longer needed. Give as a tonic: Powdered fennel, anise, coriander, and cinchona — each 30 grains; powdered gentian and ginger, one dram; powdered sulphate of iron, 15 grains. Mix and give in the feed so that each fowl will get two to fourteen grains twice a day.

Sick birds should be removed from the flock as soon as they are noticed. Houses and runs should be cleaned and disinfected. Drinking vessels and food troughs should be scalded. If the hens still have diarrhoea when the chicks hatch they should not be allowed to brood them. It would be better to put the eggs under other hens if they are available. It is possible they will not be infected in any case, but one cannot be too careful.—J.A.K.

Green Feed Cutters

What kind of green feed cutter is the best? Where can I get it and how much will it cost for either hand or power?—Subscriber, Gridley.

I have mailed you catalogs which give the information you wish as to prices and kinds of clover cutters. Which one is the best depends on how much use you have for it. For a large flock you would probably find the power cutter more economical of time and labor. For a small flock its expense would hardly be justified.—J. A. K.

Home for Old Ladies

Can you give me the location of a Protestant home for old ladies? Who could I address to find out particulars?—Subscriber, Covina.

There are two such homes in Los Angeles, the largest being the Hollenbeck Home for the Aged. A card to it will secure information as to the requirements but we believe there is a long waiting list, and in addition that home is open only to those who can make certain cash payment with the application. When that is made lifelong care is assured. One may also write to the W. C. T. U., Temperance Temple, Los Angeles, California, and secure information as to old ladies' home located on Avenue 57 of that city. In addition one may make application through their own church organization and often secure help in locating a home.

WOOL STOCKS ON DECEMBER 31, 1918

Dealers and manufacturers reported 213,600,000 pounds of wool, grease equivalent, held by them December 31, 1918. Stocks in pounds by classes as given in the bureau of markets, United States department of agriculture, report were: Grease, 140,524,763; scoured, 26,163,548; pulled, 15,447,429; tops, 11,817,192; and noils, 17,489,814.

The wool purchasing quartermaster reports on December 28, 1918, that the total stocks of wool in the government's possession, spot and transit, was 313,746,502 pounds and estimates the quantity of wool in dealers' hands not yet billed to the government at 70,000,000 pounds. Total manufacturers' stocks of grease, scoured, and pulled wool reported to the bureau of markets were 77,650,921 pounds. This amount added to the figures on government stocks gives a total of grease, scoured, and pulled wool in the United States on December 31 of approximately 460,000,000 pounds.

Stump Land Worth Money To Day

This one-armed man Pulls big trees by hand

FRANK M. HANCE, a one-armed farmer of Bowie, Md., sent me this photo of himself and a "K" pulling a double silver maple, 3 ft. 8 in. in diameter at the ground. What he has done you can do. Clear your stump land cheaply—no digging, no expense for teams or powder. Your own right arm on the lever of the "K" Stump Puller can rip out any stump that can be pulled with the best inch steel cable. I guarantee it. I refer you to U. S. Government officials. I give highest banking references.

HAND POWER
K Stump Puller

ANY red-blooded man with a "K" can outpull 16 horses. Works by leverage—same principle as a jack. 100 lb. pull on the lever gives a 48 ton pull on the stump. Made of best steel—guaranteed against breakage. Has two speeds—60 ft. per minute for hauling in cable or for small stumps—slow speed for heavy pulls. Works equally well on hillsides or marshes where horses cannot go.

IMPORTANT To one man in each locality I will make a special money saving offer. Write for it today.

—Electricity opens a New Era of Progress on the Farm!

What would the city be without electricity?

Yet electricity is just as much needed on the farm as in the city

The back-breaking drudgery, the soul-grinding hard work, the long hours, the dreary monotony of small tasks—those are the things that make farm life hard—that drive the boys and girls to the cities by thousands every year.

Electricity turns the tables on all these unpleasant features, and electricity with its many possibilities comes to you in **DELCO-LIGHT**—up to the minute with the latest improvements, tried and tested and true, as over 50,000 satisfied users will tell you.

DELCO-LIGHT is the sign of progress on the farm. Also it is a sign of prosperity on the farm—for **DELCO-LIGHT** speeds up everything, saves you from seven to twenty or more hours a week, increases efficiency, saves man power and reduces costs. Your farm is a factory; **DELCO-LIGHT** gives you **MORE POWER.** Mail the coupon on opposite page and learn how much more power. Don't wait—mail it now!

From Hundreds of Letters We Quote these:

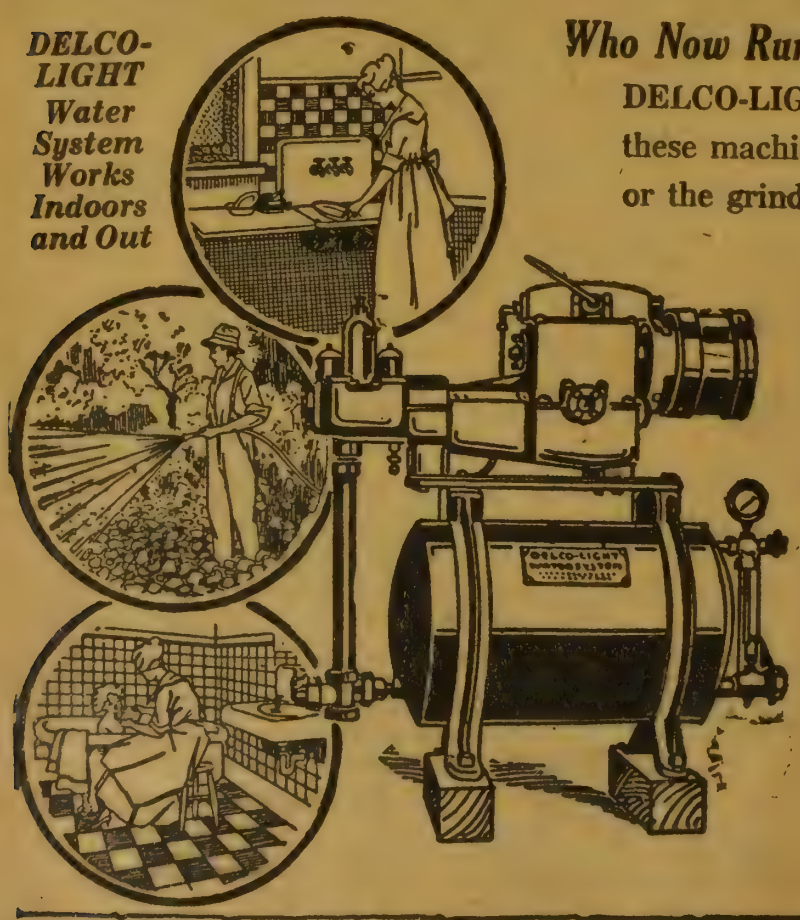
"My Delco-Light plant is always on the job. No trouble to operate. Lights powerful and steady.

"Operates deep-well pump, electric iron, etc., with perfect satisfaction and little expense. Would give up my automobile before I would my Delco-Light plant.

(Signed) "JOSEPH BLACK,
"Hillcrest Orchards,
"Oroville, California."

"We have had one of your Delco-Light plants installed in our home for more than a year, and I want to say that it has proven perfectly satisfactory in every respect. Gives a splendid light and operates our flat iron. Our cost of operating has never exceeded 75 cents per month.

"We are more than satisfied with Delco-Light and would recommend it to anyone desiring a perfect lighting system.



(Signed) "A. P. KLINT,
"Turlock, California."

"Our Delco-Light plant is running in fine shape. We are very much pleased with it. The lights are steady and bright.

"Any rancher who wants to live in comfort in his home and with perfect safety from fire about the house, barns and outbuildings should have Delco-Light, and the lady of the house should have a flat iron. It works fine and the cost to run is very small.

(Signed) "E. W. SLYGH,
"Armada, California."

Holsteins Without Price

Most Holstein breeders have in their herds breeding animals upon which they would not put a price under ordinary circumstances. It was such animals as these that claimed the attention of the Committee of Selection, H. V. Bridgford, James W. McAlister Jr., Frank L. Morris, and C. L. Hughes, when inspecting the various herds to select cattle for

The Guaranty Sale

State Fair Grounds, Sacramento, Cal.
Thursday, March 27, 1919

There will be 66 great animals in this sale, 60 females and six bulls, and buyers will find here the most desirable Holstein quality ever assembled for a one day sale in the world—a strong statement but a true one.

You will find in this sale: The highest record cow ever offered at public sale, Boweda, over 37 pounds butter in seven days; the highest record bull ever sold in the west, his dam having an official record of 41.01 pounds butter from 831.7 pounds milk in seven days, and she has now to her credit over 158 pounds butter from over 3500 pounds milk in 30 days, the greatest combined milk and butter record for 30 days ever made in the United States and exceeded by only one cow in the world; more than 25 daughters of 30 to 35 pound cows; more than 35 daughters of 30 to 40 pound sires; EVERY BULL IN THE SALE OUT OF A 30 TO 41 POUND DAM; the first high record females ever sold bred to the $106,000 bull, CARNATION KING SYLVIA; every consignment is a star consignment, 14 herds contributing.

Second Annual
Wisconsin Holstein Breeders
—SALE—

Held under the auspices of the

Holstein Breeders Association of Wisconsin

March 12 and 13, 1919

In the New Sale Pavilion in Fond du Lac, Wis.

Would you like a chance at the cream of Wisconsin's Holstein Herds?
From no place in the world can you secure better, healthier, more dependable Holsteins.
The cattle consigned are a remarkable offering.

Among Them are:

A Daughter of Wisconsin's State Record Cow, 36.36 pounds, bred to the Highest Record Bull in Wisconsin, a 42.31 pound Son of Bess Burke Ormsby. In the pink of condition.

A Beautiful Daughter of the 40.32 pound sire, King Model, from a 23.50 pound dam, and bred to a 30.27 pound son of King Segis Pontiac Alcartra.

A Fine large 27.66 pound cow, bred to "The King," due to freshen before the sale, and will be re-tested. Calf sold also.

A Classy 25.435 pound four year old from a 31 pound dam, next dam 32 pounds. Also a 27 pound four year old, and a 28 pound four year old. Real Prospects for 30 pounds or better.

Some Good Record Daughters of Spring Farm King Pontiac 6th, and Fine Individuals. As Good as the Best.

A 22.03 pound junior three year old Daughter of Woodcrest Pietje Walker, and Bred to Iowana Sir Ollie. Not many of these for Sale.

A Beautiful Yearling Son of King Segis Pontiac, from a 26 pound two year old.

A Bull Calf, Some Individual Too, whose Five Nearest Dams average over 1000 pounds butter, and 23,000 pounds of milk in one year. Just good enough for Anybody, if Year Records Count for Anything.

Poland-Chinas Sell Well

Written for California Cultivator By Bruce S. Bennett

A MORE enthusiastic crowd of breeders would be hard to find than those that comprise the Poland-China Breeders' Association of Kings County. What cooperation and good fellowship will accomplish was thoroughly demonstrated at their sale held in Hanford Feb. 22nd.

Unlike many such sales every breeder was on hand to assist in any work or boosting necessary to bring the sale to a successful conclusion. A very inspiring sight was a crowd of 25 pig club boys from Fresno County, accompanied by their farm demonstration agent, there to purchase pure bred sows. The boys are being financed by a number of banks of the county which believe in starting the boys right so are purchasing for them pure bred sows and gilts bred for early spring farrow. Owing to the high prices prevailing only part of the boys were able to secure pigs, but those that didn't will be supplied from the herds of the various breeders.

Seventy-one head of sows and gilts including a few boars sold for a grand total of $11,827.50, making an average of $166.58 which, I believe, is by far the best sale of Poland-China's ever held in the county, if not the state.

The top of the sale was from the herd of Wm. Bernstein. His magnificent sow, Kings Jumbo Lady, after a few minutes of spirited bidding, went to Mr. Gray of Hanford for $460. The consignments from the Bassett herd were snapped up quickly and totaled $2175, the tops bringing $430, $355 and $310. The wisdom of the association in securing Col. Ben Rhoades, of Los Angeles, to cry their sale was verified by the high average secured. The colonel was in good spirits, had the crowd with him from the start and kept things moving with the rapidity necessary in securing high averages.

Detail report of the sale follows:

NOTES OF THE SALE

Wm. Bernstein continued the habit he has formed of topping the sales, by doing so in this sale with the excellent specimen of the breed, King's Jumbo Lady, which was sold to Mr. Gray of Hanford for $460. Another, Betsy H., went to Mr. Cross of Merced for $300. Mr. Bernstein knows the value of advertising as these two animals were specially advertised for this sale in the Cultivator.

F. D. Ross, the efficient secretary of the association, was about the busiest man on the grounds. In fact he was so busy he did not finish 'til way in the night.

Dr. J. A. Crawshow, who enjoys a very lucrative practice, gets his relaxation from his Polands. As his offering was mostly young stuff he should be well pleased with the results of the sale.

John Bernstein was very busy all day boosting, especially the get of President, the boar that John banks on. He drove in seven young pigs and announced he would sell one buyer to take his choice—$180 was the price.

From the DeRaad herd came seven head, mostly late spring farrow, and age considered brought very satisfactory prices.

Dimmick Bros. had eight head in the sale and while they sold very satisfactorily were entitled to a little more than was received.

W. L. Hoag & Son, comparatively new breeders, sent ten nice gilts to the sale and were rewarded for their efforts by making the nice average of $144. All of these were of 1918 farrow and some rather late.

W. S. Hubbard & Sons entered only two animals but had the satisfaction of seeing one of them go way up to Mendocino County at $156.

When H. D. McCune drove in the two litter sisters, Big Jane and Big Ann, it kept Auctioneer Rhoades mighty busy as it seemed like everybody wanted to bid on these two at the same time. They went to H. C. Shinn and A. J. Elliott, both of Tulare, for $325 each. Had these two been in most any eastern sale the price would have been doubled.

Secretary Ross was only able to send two gilts of April, 1918 farrow, but they made the average of $170.

While Mr. Vaughn, one of the newer breeders, had nothing of his own old enough for the sale he showed his enterprise by going out and buying four. The four sold for $540.

During the sale Wm. Bernstein put on what he called the Ladies' Special—two young sow pigs—and the bidding was limited to the ladies. Mr. Bernstein's offer to buy back either in six months at the price paid for both produced a flood of bids. Mrs. Guerin of Visalia was the fortunate bidder, paying $350 for the two. We venture the opinion that neither will return to the Bernstein ranch.

LITTLE CHILDREN IN FRANCE SUFFERING FOR MILK

Serious conditions from lack of milk are related in a cable received at the office of the American Committee for Devastated France. Mrs. Dike and Miss Morgan, who are in charge of the committee's work in France, beg that at least 100 milch cows be provided at once to save the lives of babies and little children in the department of the Aisne.

It is almost impossible to buy cows in Europe and the few for sale are held at enormous prices. American breeders who can supply cows suited for export to France are requested to communicate prices and full particulars to the American committee's offices at 16 East 39th Street, New York City.

Berkshire Breeders Hold Best Meeting

WEDNESDAY and Thursday, February 19th and 20th, the members of the Berkshire clan met at the University Farm, Davis, for the fourth annual meeting and sale, and when the last event on the cards was over, every one in attendance frankly stated that the meeting had been—as advertised—a two day Berkshire exposition, and quite the most successful meeting ever held by the Western Berkshire Congress.

Taken as a whole this year's meeting was refreshingly different from past congresses. The Berkshire hog occupied the center of affairs rather than the Berkshire breeders. The entire program was planned to set forth the merits of the breed by actual demonstration. In place of the usual eulogistic addresses declaring the many good points of the Berkshires, a barrow contest was arranged—thus checking it up to the hog rather than a speaker. It is not beside the fact to state that the barrow contest at Davis was easily the best show of single barrows and pens ever held in this state.

The contest was limited to pigs farrowed since March 1, 1918, and the prizes and trophies offered were such that no less than 15 splendidly selected and fitted barrows were driven before Professor J. I. Thompson for rating. Professor Thompson had his work cut out for him and after he had carefully worked over his class, selected his three top barrows, and explained his reason for his ratings, the crowd felt that they had been treated to a highly instructive demonstration.

One of the most interesting features of this show was the fact that, with the exception of the third prize barrow, the winners were developed by young breeders. The first prize barrow was developed by J. Francis O'Connor of the Castleview Ranch, Santa Rosa, and represented his first attempt at barrow fitting. The second prize barrow was shown by W. F. Sandercock of the Natomario Rancho, Sacramento, and was one of the first developed in that herd. The third prize barrow was from the famous Humphrey herd.

After the single barrows had been judged, three pens of three barrows each, were placed. Frank B. Anderson, Sacramento, one of the youngest of the Berkshire breeders, had the first and second prize pens and W. S. Guilford of the Superior California Farm Lands Co., showed the third prize pen.

Following the on-foot judging, ten of the barrows were slaughtered and entered in the carcass contest. This contest was judged by Fred Farrell, a retail butcher of Sacramento, and the fact that the winning carcass was from a pig not placed on foot, but indicates that it is not always possible to tell what is under the skin.

The barrow and carcass contest developed the keenest interest and will doubtless be made an annual event at future congress meetings, and plans are being discussed that will probably result in a big barrow show at the state fair. Such contests serve to stimulate better feeding, and when properly conducted can be made to bring about a better understanding on the part of the producers as to what kind of a hog will come nearest producing the sort of carcass that the butcher likes.

The following table contains the results of the two contests. The pens of three were placed as stated above:

Owner	Live Weight.....	Dressed Weight.....	Dressing Percentage...	Rating on foot.....	Carcass Rating.....
umphrey	..390	329	84.3	1	3
Connor	...320	267	83.4	1	..
nderson	...220	169	77.0	..	1

perior California Farm Co...	260	194	74.6	..	..
perior California Farm Co..	245	202	82.4	..	..

Following the barrow contest a students' judging contest was arranged. Nearly 100 students, most of them boys who left school at the beginning of the war, and who have returned to take up their work at the University Farm School, were entered. Three classes were provided, one of four sows, one of four gilts and one of four barrows. The boys were required to place each class and to give their reasons on one class.

The winners were:

J. P. Comerford, first; Edw. Lewis, second; L. F. Ernst, H. W. Woodward, B. J. Showers, D. Boucher, E. M. Penn and Paul Goya, all tied for third place.

After the various classes had been judged the annual meeting of the congress was called by President W. M. Carruthers.

For several weeks prior to the meeting there had been rumors afloat that this year's congress meeting would do one of two things—either set the breed back five years or put it ahead five years. No one could imagine that the first contingency would develop, because the character of the breeders identified with the organization is such that each would willingly make any personal sacrifice rather than to permit a situation to develop that would in any way retard the progress or dim the prestige of the breed.

Those who came expecting to see a political ruction develop were disappointed, but were treated to one of the finest demonstrations of breed loyalty.

Berkshire breeders are aggressive and it was but natural that a contest for the honor of directing the breed's progress shhould develop. It is no empty honor to be an officer of the congress and there were several aspirants for the office of president. Some insisted that President Carruthers stand for reelection. Other men had their supporters. It did look bad for a while, but President Carruthers saved the day by gracefully withdrawing his name, and after much pressure A. B. Humphrey, who has been one of the towers of strength in Western Berkshire affairs, and who had repeatedly declined the honor for a number of years, was induced to become a candidate. Immediately the skies cleared, Mr. Humphrey was unanimously elected president and what might have started a Berkshire revolution was averted. The following officers and directors will work with President Humphrey:

James Mills, Hamilton City, vice president; Frank B. Anderson, Sacramento, secretary; Mrs. Ruth Hardy, Orland; Geo. Murphy, Perkins; J. Francis O'Connor, Santa Rosa; W. F. Sandercock, Sacramento; Homer Hewins, Jr., Calistoga; H. C. Muddux, Sacramento.

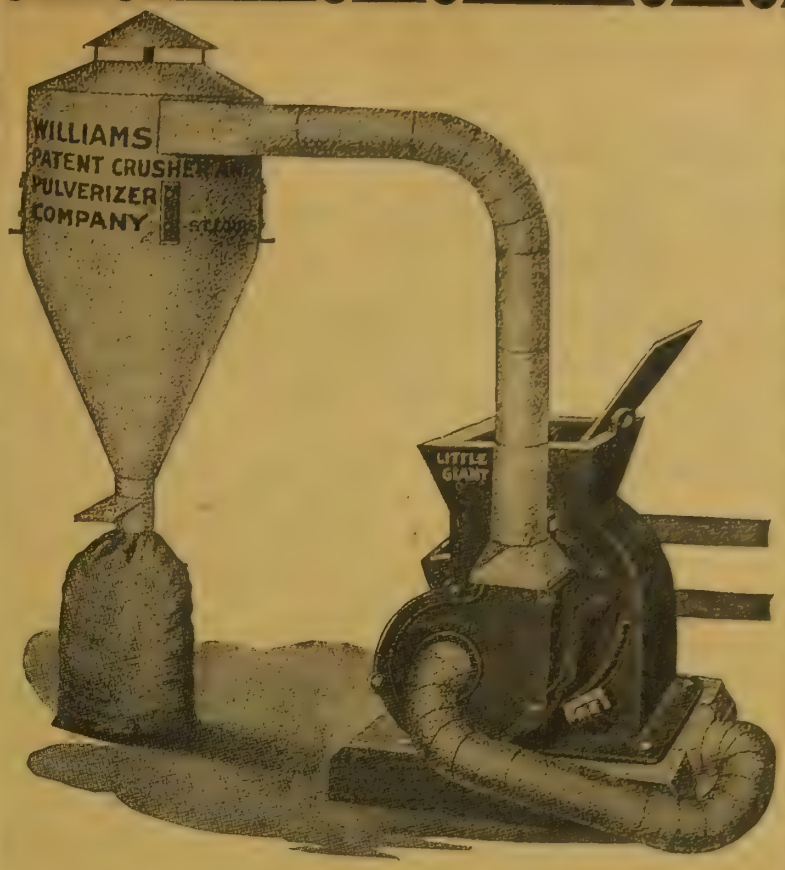
Resolutions were passed endorsing the work of the American Berkshire Association; urging the state legislature to pass the pure food bill, the pure seed bill and the Rush dog tax bill.

At the suggestion of James Mills a resolution was passed urging that the state legislature adopt a more liberal policy toward the college of agriculture and the University Farm School.

W. F. Sandercock suggested that the Western Berkshire Cangress investigate the several fake hog syndicates operating in this state. The proposal met with hearty endorsement and the congress officials propose to do what they can to force these fake outfits out of business. All were agreed that the literature being used to entice money from innocent investors is calculated to deceive, and that the claims of huge returns are preposterous.

Following the meeting and election of officers the annual dinner was served in the University dining hall.

THE ONLY ONE LACKING



"Why are you so sure there is no such thing as a fourth dimension?"

"Because," replied the discouraged fat man, "if there was I'd have it.'

HER DIAGNOSIS

"What kind of a character is old Mrs. Gabby?"

"She's the kind of character that doesn't believe anybody else has any."

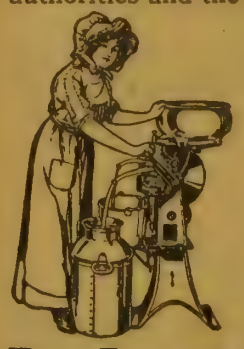
$20.00 TO $30.00

per cow per year with a

DE LAVAL

Cream Separator



Formerly, with butter-fat at 25 to 35 cents a pound, a De Laval Cream Separator saved $10 to $15 per cow per year over gravity skimming.

Now with butter-fat selling at 50 to 65 cents a pound, and even higher, the saving with a De Laval is doubled.

If you have only two cows and are selling cream or making butter, a De Laval will soon save enough to pay for itself.

With butter-fat at present prices you need a De Laval more than ever before, and if you already have an inferior or half-worn-out separator, your cream loss with such a machine is too big to be neglected.

The best cream separator you can get is the only machine you can afford to use these days, and creamerymen, dairy authorities and the 2,325,000 De Laval users all agree that the De Laval is the world's greatest cream saver. They know from experience that the De Laval skims the closest, lasts the longest and gives the best service.

Order your De Laval now and let it begin saving cream for you right away. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

Western Canada's "Horn of Plenty" Offers You Health & Wealth

Western Canada for years has helped to feed the world—the same responsibility of production still rests upon her. While **high prices for Grain, Cattle and Sheep** are sure to remain, price of land is much below its value.

Land capable of yielding 20 to 45 bushels of wheat to the acre can be had on easy terms at from $15 to $30 per acre—good grazing land at much less.

Many farms paid for from a single year's crop. Raising cattle, sheep and hogs brings equal success. The Government encourages farming and stock raising. Railway and Land Co's. offer unusual inducements to Home Seekers. Farms may be stocked by loans at moderate interest. Western Canada offers low taxation, good markets and shipping; free schools, churches and healthful climate.

For particulars as to reduced railway rates, location of land, illustrated literature, etc., apply to Supt. of Immig., Ottawa, Can., or

Stray Thoughts of a Cowman

Written for California Cultivator By A. L. Spellmeyer

A farmer works hard with a $40,000 investment, feeds his stock, and probably has a couple of thousand bushels of corn left over to sell. The price for the corn he has fed to stock depends upon the price he gets for the beef and hogs. Therefore the value of his farm depends upon stock prices.

Along comes a speculator and sells on a ten cent margin or less a half million bushels of corn which works against the value of the farmer's corn and his farm and his stock. For $5000 margin this speculator can affect the probable corn returns of 250 farms. The investment of the farmers is $10,000,000 as against the $5000 used to affect the price. The man who advanced this view is a banker and farmer of Illinois and has a million or two himself, but as he says there are a lot of things which need adjustment, if production is to be increased and stabilized. If the farmers had a national association which worked it would be called a trust and wouldn't be allowed to influence farm product prices.

The live stock investment of this country, in cattle, sheep, hogs, land to raise them, and industries which supply them with needful merchandise probably total 60 billion dollars or more. The actual killing plants and stock yard's cost probably does not total a half billion dollars. It's like a cootie driving an elephant—as long as the elephant doesn't object.

We notice "J. O." is now advocating a "closer understanding" and increased production. From the book written some years ago we thought that all the prosperity of this country, its meat demand and its live stock wealth was due to the packers and that it was both righteous and above reproach in the system it used.

This view has been sadly perforated by the federal trade commission, and of course every man reserves the right to change his opinions. The light is permeating, and if true, that closer understanding and increased production is going to be a policy, there has been one long step taken toward better conditions for live stock producers. There isn't one producer in a thousand who won't meet the packers more than half way, and this country will be far more prosperous and our people eat better at lower cost. This get-together idea is good stuff and "J. O." is on the right track, if he doesn't jump it at the first few bumps.

Some of us have been thinking that these few big food handlers didn't care much what this country did or whether its producing industry was shot to pieces or not. The dollars can go elsewhere and make their interest if conditions become too burdensome. Some of us figure that all those new plants in South America and Australia could still make a lot more money as the less production in this country the more demand for chilled and frozen import meats. They can raise big steers in South America for less than we can summer a cow and meat is half to a third of our prices.

Capital must have a fair return and our packers must make money so we cannot be too severe in our judgments or taxation, or we will merely stimulate a foreign industry, raising it to compete against our own essential live stock and farm production. More production can be fostered by government interests and financial backing. If "J. O." would forget for a while his own interests and apply his great talents to solving this food problem, without bias, he would be hailed by future generations as our economic George Washington.

Half of the trouble with the cattle business today is financial, and the government can correct that with long term cattle loans as those six months loans are a mere delusion for any man in the producing stock line, although of use to feeders.

Chicago and Kansas City loan heavily to Arizona, which borders California. Trade follows loans. Kansas City and Chicago do an enormous mercantile trade with merchants right at Los Angeles portals, and Kansas City gets the bulk of the sheep and the cattle which go on the fat market. We will never have a city here (Los Angeles) until we get a different financial line up, and handle the money for producing industries, as well as give it a stockyards for the stockmen.

The oldtimers in the Biblical days lived seven or eight hundred years, raised great herds and the people to herd them. All they had to do was to graze the grass, fight off the wild animals, spin the wool and make their sandals, and eat the meat. They didn't have to figure packers, or tight money, or a poor market. Plenty of time and lots of help. They didn't have blizzards to contend with or winter feeding, and when they grazed out the country moved every hundred years or so to a new range.

Later a lot of herders and farmers got together and started a town, which they called Rome, and which whipped all the other towns in their parts. When the farmers and the herders got pushed to one side in the councils by the politicians and soft livers, Rome had a tumble.

This age and generation is wiser, as intellectually we all know the value of raw products and producing industries but have a hard time convincing our political directorate and representatives that we want the government to back up production and start it by giving us cowmen long term loans so that we can get down to producing good cattle and more of them.

All labor troubles and unrest hurt the stability of live stock prices, and Ole Hanson did good work, if he can make it stick. We have lots of work in roads and building to do at home and ships to deport the anarchists. It would be hard lines for the Southwest to run up against tight money and troubles after all the grief and loss during the last year.

The spring prices are still unsettled although many sales have been made at considerably advanced prices over last year. A bunch of poor quality mixed California stock cattle sold recently for $60 a head and a big bunch of good Colorado cows at $87, which shows a fair demand. Yearlings are held in Arizona from $35 to $48 and in Nevada and Utah $40 to $45. Good Panhandle yearlings are held at $50. There is a big steer demand but few cattle of age to fill it.

Clif Harris is to bring out some registered Missouri whiteface Herefords next month and has assembled about five cars of the good ones. Sometime in the years to come the stock industry is going to thank Harris for his efforts for better California bulls, as to convince a man who wants a bull

to buy a registered one takes as much time as to sell a carload. Such men as Harris, and Bellows, the Shorthorn ribbon winner, believe there is a great future in growing fine cattle in this state. It is surprising how many good herds in both Durhams and Shorthorns have been established and developed here within the last two years, and new men are joining the ranks every few weeks.

Any man who has tried to develop a good herd from grade cattle can appreciate what work and constant effort it entails. Better bulls and culling do wonders, but there always comes a time when it dosen't seem worth while, but the man who sticks and makes his cattle weigh 100 pounds more than his neighbor's finally gets there, financially.

Adam Patterson, the oldtime cow man from Nevada, was harking back to the time when beef brought a cent and a half per pound and yearlings $6.00 a head. As he says, "The price of cattle in the end depends upon how much meat the working man eats and if he has the money to buy it with." The upper crust may go strong for sauces and chicken a la King, but the working man buys the thick roasts and juicy steaks and goes to it in bulk.

A man can't help but wonder how much of the reported increase of cattle in the United States is like the big increase of hundreds of thousands of head reported for Arizona, which is due entirely to closer reporting, closer taxing and closer estimating, and not actual increase in cattle during two years of drouth and loss. In 1907 we had about ten million more cattle and twenty million less people and no close methods of estimating numbers.

INCREASE PROFITABLE BUTTERFAT PRODUCTION

The following are essentials in profitable butterfat production, according to H. H. Kildee, formerly of the dairy husbandry division of the University of Minnesota, University Farm, St. Paul:.

Proper shelter in a warm, light, well ventilated barn. The leeward side of a barbed wire fence is an expensive shelter for milk cows.

A knowledge of the herd through the use of milk scales and the Babcock test.

Corn silage and clover or alfalfa hay as patriotic, profitable, palatable feeds.

A grain ration in proportion to milk and butterfat produced.

Fall calving as a means of increasing production as well as price at a time when more labor is available.

A bushel of grain fed before calving rather than two fed afterward. Prepare the cows for the milking period.

Water of moderate temperature. Ice water is not conducive to greatest milk production.

A milking machine in case of labor shortage.

Cooperation with the neighbors in organizing cow testing associations and purchasing feeds in carload lots.

DAIRY FEEDING PRINCIPLES

Prof. C. H. Eckles, formerly professor of dairy husbandry in the University of Missouri for a number of years, and now of Minnesota, and who has conducted some of the most valuable experiments and also made some of the highest records with dairy cattle in the United States, has the following to say in regard to feeding and milk production:

"A dairy cow uses feed for the following purposes:

"1. For maintaining the body.

"2. To supply the material for milk.

"3. For developing the foetus.

"4. For growth in case the animal is immature.

"5. At times to produce gain in weight.

"For each of these purposes, three general classes of food material are required:

"1. Protein or nitrogenous material.

"2. Carbohydrates and feed to supply the heat for energy.

"3. Ash or mineral water .

"The main problem of feeding is to supply the proper amount of the food material of the three classes in the least expensive form."

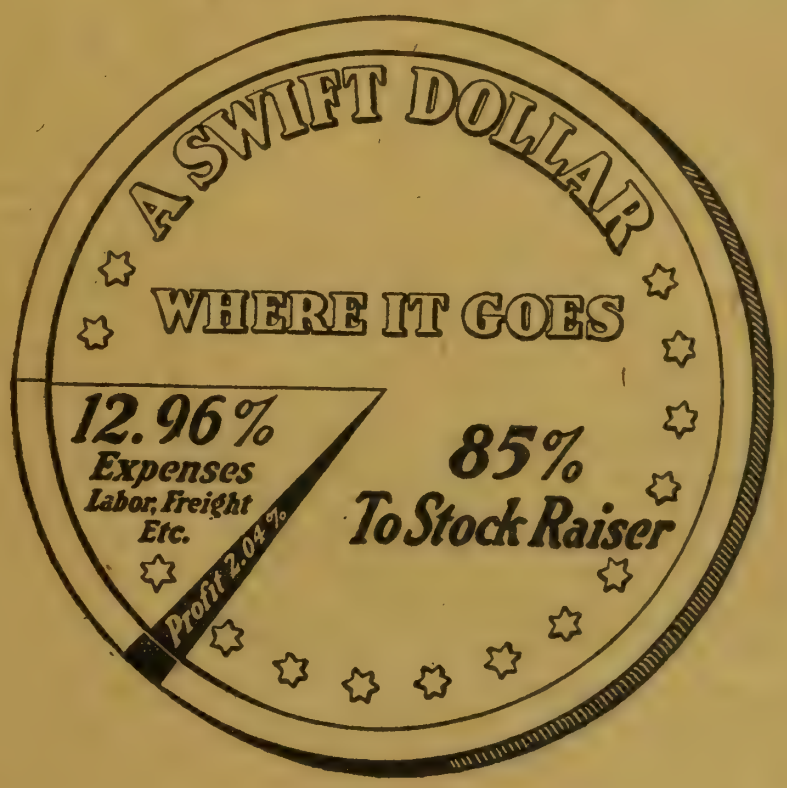
MAKING STOVER INTO SILAGE

Some interesting results of Illinois experiments with feeding silage made from corn stalks are reported by H. P. Rusk. Mr. Rusk reports the following: The normal silage contained 7.35 bushels of corn per ton and cost $10.92 per ton as feed. On the basis of this value and three cents per pound for linseed oil meal, our standard winter maintenance ration costs us 24.8 cents per cow daily. On the basis of $1.50 per ton for the stover silage, and three cents per pound for linseed oil meal, the feed cost in the stover silage lots ranged from 7.2 to a little over 8.0 cents per head daily, or about one-third of the cost of maintenance with normal corn silage.

HOG CHOLERA LOSSES DECREASE

Losses from hog cholera declined greatly in the four years, 1914 to 1917 and a further reduction is expected for 1918, says a letter from the secretary of agriculture to Addison T. Smith, a member of the house of representatives.

The secretary calls attention to the necessity for state cooperation in the federal government's campaign against this destructive animal disease.



The losses for 1914 totaled 6,304,300 animals, which, valued at $10.40 a head, made a monetary loss of $67,697,461; for 1917, 2,952,144 animals, valued at $11.73 a head, a monetary loss of 32,475,190. During the four years the number of animals taken by the disease was 18,835,901, representing a value of $188,448,643.

CHANGES IN SALES DATES

The date of Walter F. Mitchell's public sale of registered Holsteins on his farm near Visalia, has been changed to Thursday, April 3, instead of April 9 as previously announced.

The dispersal of the E. R. Putz Holstein herd at Laton, has also been changed and the new date will be announced next week. It will probably be the day preceding or the day following the Mitchell sale.

The Swift Dollar for 1918

Live Stock News Notes

Sunnyside Holstein on Test

R. F. Guerin, owner of Sunnyside herd of Holsteins, has just completed a record of 25 pounds of butter in seven days from Cantate Wonder 3rd. She is a half sister to Melba Hengerveld, who made 30.38 pounds of butter in seven days. They are both daughters of Arcady Pontiac Wayne Hengerveld, who has 30 A. R. O. daughters. He was the senior herd sire of Sunnyside. He has more A. R. O. daughters than any other sire developed on the Pacific Coast.

McDonald Goes East for Angus

Alex. McDonald, herdsman in charge of the herds of beef cattle maintained by the University of California, at the university farm, Davis, has been commissioned by two leading Aberdeen-Angus breeders of the Hawaiian Islands to purchase for them 10 head of females and two bulls of herd heading caliber.

Mr. McDonald left for a trip through the cornbelt states early this week and expects to be gone about a month. While in the East McDonald will select an Angus bull to place at the head of the university Angus herd.

McDonald was born among the "doddies" of Scotland, and, for a number of years was in charge of the Angus herd owned by Hess of Iowa. He is not only a critical judge, but is a fitter of rare ability, having to his credit one world's grand champion steer, a reserve grand champion and a breed champion, as well as many other prize winners.

Majors to Buy 150 Head of Guernseys in East

E. W. Majors of Los Angeles, one of the leading dairy cattle experts of the entire country, is now in the East for the purpose of selecting between 150 and 200 head of high grade Guernsey cows for the Adohr Stock Farm, near Los Angeles.

Mr. Majors was formerly head of the animal husbandry department of the University of California, and later of the University of Minnesota. During the past few years he has been induced to act in a consulting capacity to many of the largest dairy firms operating in the West.

Mr. Majors states that he has never experienced a keener demand for dairy cattle than exists at the present time, and that apparently dairymen who sacrificed their herds in the winter of 1917-1918 are making every effort to get back in the game.

Carruthers Makes Big Berkshire Sale

W. M. Carruthers, proprietor of the Carruthers Farm, Live Oak, California, has recently completed a sale of 20 bred sows and gilts to the Toyon Farms Association of Los Altos.

Included in the sale were some of the top sows of the Carruthers herd, and, for the most part, are either daughters of Ames Rival 100th, or are bred to him.

The Toyon Farms Association maintains a high class herd of Holsteins at Los Altos, but it is understood that the Berkshires will be established on a ranch that the association is developing in Yolo County, near Haviland Station, just north of Sacramento.

Sandercock Boar to Pennsylvania

W. F. Sandercock, owner of the Natomario herd of Berkshires, has sold his herd boar, Winona Lee Champion 6th, to Paul F. Krause, Douglasville, Pa.

Mr. Krause, it will be recalled, recently selected a carload of California Berkshires for shipment east.

Winona Lee Champion 6th was sired by Laurel Champion and his dam was Miss L. 2nd. He is a boar of considerable scale, fine depth, and exceptional smoothness and will doubtless add much to the popularity Western Berkshires already enjoy in the East.

Modesto Jerseys

F. W. Elleby, Jersey breeder of Modesto, has purchased of David Larson of Stevinson five pure bred cows and heifers and a four-year-old bull, Wildwood Critic. Four of the six head, including the bull, are the offspring of one cow, "Marigold Cretesia," who is a very fine type of cow, also a heavy and persistent producer. She has never been dry since dropping her first calf. Mr. Elleby recently sold five cows to the Hearst estate and bought the five from Mr. Larson to replace them.

California Guernseys for Hawaii

Professor Gordon H. True has recently selected for the College of Hawaii at Honolulu, from the Hidden Valley Farm of A. J. Welch at Redwood City, three registered Guernsey heifers.

The consignment consists of a two year old daughter of Dairymaid's Prince, grandson of the famous Dairymaid of Pinehurst, and two under a year daughters of Argie's Prince out of imported dams.

In making this first sale of choice heifers from his herd Mr. Welch is proving his loyalty to Hawaii, where his family has large sugar interests, and to the cause of agricultural education. He is one of those public spirited men who believes the colleges should have in their herds the best of the various breeds of farm animals, and is willing to support this belief in a substantial way.

Gerstdale Jones Sells for $2250

A year ago last fall Gerstdale Jones sold for $6600, thus establishing a new high record for a Poland-China boar. A year ago 40 sows bred to this boar established a world's record price —the 40 head averaging $683.40. On February 2, Gerstdale Jones again passed through the public sale ring and sold to Winn Brothers, Mexico, Missouri, for $2250.

Gerstdale Jones is considered to be one of the outstanding boars of the breed and a number of his sons are in service in California herds.

Natomario Berkshire Sales

W. F. Sandercock, who is in charge of the Natomas Lands near Sacramento, is making every effort to make that district a Berkshire center. In order to encourage the farmers to take up the breeding of Berkshires, Sandercock established one of the choice herds of the West. This herd not only furnishes breeding stock to the farmers of that district, but is being called on to supply a much wider territory.

Recent sales of breeding stock include a boar by Ames Rival 102d and out of Princess Lee 50th, to Louis Heitman of Nevada; a spring boar by Winona Lee Champion 6th, and out of Symboleer Belle, to John Born of Woodland; a young boar by the above sire and out of the splendid sow Silberfa Bernice, to B. S. Stewart of Amador; a trio consisting of two gilts sired by Winona Lee Champion 6th, out of Symboleer Belle, and a boar by Ames Rival 102d, out of Princess Lee 50th.

California Hogs to the Philippines

During the Western Berkshire Congress meeting at Davis, Professor Gordon H. True of the animal husbandry department announced that he had been asked to select 40 Berkshire boars and gilts for the University of Manila. The shipment will assemble during the next few weeks and it is expected that practically every California herd will be called upon. The far Pacific is proving to be an important outlet for California breeders of all kinds of live stock.

A New Ayrshire Herd

Bailey McFarland, Ayrshire breeder of San Mateo, has recently sold to H. P. Faye nine choice heifers, the aged cow, Springburn Mossy, and a young bull.

Mr. Faye, who has been operating in the Hawaiian Islands, is establishing an Ayrshire herd on his River Garden Farms near Knights Landing.

The nine heifers are all sired by Willowmoor Robinhood 32d, the Steybrae herd bull, and the price paid for them averaged $500 each. Springburn Mossy was the dam of the champion bull at the Liberty Fair at Los Angeles. The price paid for her was $750.

McFarland Sells Berkshires

Bailey McFarland, of Steybrae Farms, San Mateo, has recently sold three Berkshire gilts sired by the English boar, Champion of England, to W. M. Carruthers of Live Oak.

Mr. McFarland secured a number of English bred Berkshires from H. W. Gossard of Indiana.

World's Record Poland-China Sale

The world's record Poland-China sale was held at Kansas City, January 30, when L. R. Glover sold 37 head of bred sows and gilts for $30,475.42, a general average of $823.66. The top price, $2000, was paid by A. D. Severe and R. W. Halford, Iowa breeders, for the two year old sow, Model Belle 2d, a daughter of Model Big Bob. Sol Leonard of St. Joseph, Missouri, paid $1950 for the fall yearling gilt, Mary Pickford, by W's Giant. Seven other sows and gilts fetched $1000.

Carruthers Makes Good Bull Sale

W. M. Carruthers of Live Oak has sold to Jerome O'Neil of the Santa Margarita Ranch, San Diego County, nine young Shorthorn bulls—all about ten months old.

Five of the calves were sired by Count Glory, champion Shorthorn at the past three state fairs, and are out of Lovely, Red Lady, Mysie and Alexandria dams. One is out of White Rose by March Knight.

Four bulls were sired by the white, Hallwood Villager—one out of a Rosemary dam, and three out of granddaughters of Choice Goods.

The bull was sired by Hallwood Flash, now in the Dibblee herd, and out of a Lovely dam. So well did the buyer like the Carruthers bulls that he offered to contract for the entire 1919 crop of bull calves.

Mr. O'Neil also selected a spring Berkshire boar pig by Ames Rival 100th.

Johnson Buys Eastern Duroc Sow

Fred M. Johnson, Duroc breeder of Napa, has recently purchased from G. B. McAndrews & Son, Vail, Iowa, a two year old Duroc Jersey sow sired by King Orion Cherry and out of an Orion Cherry King dam. She is a litter mate to a boar that sold for $1000 as a pig. The Johnson sow is bred to the popular Eastern boar, Orion Cherry King Jr.

A community auction sale under the direction of the Kerman farm bureau center was held on Washington's birthday.

MAMMOTH AUCTION SALE

Live Stock and Implements

ON THE GLIDE RANCH, ONE-HALF MILE NORTH OF FREEPORT FERRY ON THE YOLO SIDE

Nine miles south of Sacramento on the Riverside Road. Two miles south of Glide Station on the O. A. & E. Free transportation from this station. Ranch leased to other parties. Positively a sale—Rain or Shine. Big barn. All to be sold in one day

MARCH 6, 1919, 10 A. M.

200 High Grade Holstein Cows—Every one raised by us and all under eight years of age.
4 Registered Holstein Bulls.
100 yearling to two-year-old heifers.
50 big work horses and harness.
1 Belgian stallion.
150 fat hogs—150 to 200 pounds.
20 brood sows.

Anchorage Farm Bred Berkshire Gilts

We now offer, at reasonable prices, a particularly choice lot of bred sows and gilts. All are bred to Anchorage Leader 2nd, an outstanding son of the World's Reserve Champion,

Star Leader

Sixty of our brood sows averaged 8¾ living pigs. Our last May pigs weigh over 300 pounds. Anchorage Berkshires have extreme size, are prolific, mature early, are splendid feeders, and are noted for their bone and feet. They are money makers. The Anchorage Farm guarantee—the purchaser must be satisfied—goes with every sale.

Full description and prices on receipt of your inquiry.

Anchorage Farm

Home of STAR LEADER, pronounced the greatest living Berkshire boar

Orland Calif.

A GRANDSON OF TILLY ALCARTRA

We are offering for sale a son of Prince Alcartra Korndyke from one of the best daughters of Prince Gelsche Walker.

This bull is a good individual, straight and well marked. He is backed on both sides by good yearly records, his dam having 542 pounds butter as a two year old and her dam 536 pounds as a two year old.

For price and further particulars write

The J. S. Gibson Co., Williams, Cal.

Berkshires Average $153

FOLLOWING the annual meeting of the Western Berkshire Congress at the University Farm, Davis, 20 head of superior Berkshires were sold at public auction for a general average of $153.75.

It had originally been planned to offer 50 head, but many recent sales, including the carload shipped to Pennsylvania, forced the consigners to trim their allotments, if the sale was to be held to the high standard of former years.

Perhaps the outstanding feature of the event, aside from the quality of the offering, was the fact that practically the entire offering was absorbed by men who are just starting in the business. Only two established breeders appear in the list of buyers.

No extreme prices were registered, but uniform range of values prevailed. Only two sows and one boar sold above the $200 mark.

The honor of consigning the top animal goes to Frank B. Anderson of Sacramento, a man who two years ago secured his foundation stock at the congress sale. Columbia's Leader, a two year old son of the noted Grand Leader 2nd, turned the trick for Anderson and at the bid of $310 became the property of Brown & Boyd, two young men just back from service, who are starting a herd near Mercuse, Sutter County.

The top sow, Princess Lee 49th, was consigned by W. F. Sandercock of the Natomas Company, Sacramento, who secured his start at the last congress sale. The second high sow fetched $230 and was consigned by J. Francis O'Connor of Santa Rosa, who, like Sandercock, made his start last year.

Another interesting feature of the sale, and one that should not be overlooked by other breeders, was that a goodly number of the animals were purchased by former students of the University Farm, who received their introduction to Berkshires while attending former sales held at that institution.

Ord L. Leachman of Sacramento did the selling in a very satisfactory manner.

The list of sales follows:

1—Leader's Belle of Glenoak, by Iowana Royal 34th, Oct. 10, 1917; consigned by Schmeiser Ranch Co., Davis; Brown & Boyd, Mercuse $135

Sandercock Land Co. Consignment

2—Princess Lee 48th, by Winona Lee Champion 6th, Sept. 8, 1917; Brown & Boyd 185
3—Litter mate; Brown & Boyd 240
4—Litter mate; Geo. Strauch, Del Poso Heights 160
6—Miss Villa Rookwood by Mayfield Rookwood 2nd, Nov. 17, 1917; Geo. Strauch 100
8—Rookwood Lady 113th, by Artful Duke 32d, April 30, 1915; consigned by H. L. and E. H. Murphy, Perkins; H. C. Muddux & Son, Sacramento 150

Frank B. Anderson Consignment

9—Columbia's Leader by Grand Leader 2d, March 20, 1917; Brown & Boyd 310
10—Alice Robin by Robinhood Baron S., Oct. 20, 1915; A. E. Greene, Hood 135

Castleview Ranch Consignment

13—Hopland Grand Lady 2nd, by Iowana Rival Majestic, Sept. 20, 1917; H. C. Muddux & Son 230

31—Boar, litter mate; A. L. Emmery. 150

LATEST ITEMS ON THE GUARANTY SALE

The auctioneers for the Holstein Breeders' Guaranty Sale to be held at State Fair Grounds, Sacramento, on Thursday, March 27, will be Col. Ben A. Rhoades, Los Angeles, and Col. Harry C. Cranke, Nez Perce, Idaho.

Several choice females in the sale are bred to Matador Segis Walker, senior herd sire at Carnation Stock Farms, Seattle. A senior three year old daughter of this great sire recently made over 40 pounds butter in seven days and another three year old now on test has 29.60 pounds in seven days to her credit.

An addition to the list of 30 pound cows in the sale was made at Rosamaines Rancho, A. J. Stalder, Riverside. She is by a grandson of King Segis, only five years old, and a splendid individual.

The latest 30 pound cow to be added to the sale is a beautiful daughter of King Hengerveld. She is now on test in the A. W. Morris & Sons herd at Woodland, and has over 30 pounds butter in seven days from close to 600 pounds milk as a senior four year old.

Adirondac Wietske Dairy Maid, who made 41.01 pounds butter from 831.7 pounds milk in seven days, now has to her credit over 158 pounds butter from over 3500 pounds milk in thirty days, the greatest combined milk and butter record ever made in 30 days by a cow in the United States. Her son is in the sale.

Some very choice heifers in the sale are out of daughters of Sir Skylark Ormsby Hengerveld, who now has five daughters from 30 to 34 pounds butter in seven days. His fifth daughter to go above 30 pounds is Verona Hengerveld of Glen Eva, who made 32.64 pounds butter in seven days in the herd of E. E. Freeman, Modesto. This cow also has above 130 pounds butter in 30 days at the present time.

Several of the good ones, including a 30 pound cow, are bred to King Pontiac Netherland Segis 3d, herd sire at Rosamaines Rancho, owned by A. J. Stalder, Riverside. The first three daughters of this bull recently freshened and have made official records. A senior yearling made 17.07 pounds butter from 335 pounds milk in seven days, and two junior two year olds have made 20.41 pounds butter from 404 pounds milk, and 20.52 pounds butter from 425 pounds milk in seven days respectively. A sister to this bull, by the same sire, recently made over 30 pounds butter in seven days.

LIVE STOCK NOTES FROM NEVADA

George Wingfield has lately added a flock of Rambouillets and a flock of imported Shropshires to his Churchill County ranch near Fallon

Jack Kington, formerly herdsman for the department of animal husbandry at the University of Nevada, has lately taken a position as herdsman with the J. H. Cazier & Sons Co., Hereford breeders at Wells, Nevada.

Hon. H. I. Dangberg of Minden is just completing a model dairy plant including a fine barn in which to house his young Ayrshire herd, just purchased.

A heavy rain and light snow has covered most of Nevada. Heavy snows in the Sierras guarantee an ample water supply for irrigation during the coming season.

The first spring foal has arrived at the Nevada Stock Farm, breeders of thoroughbreds.

Mr. Hale Marsh of Modesto has donated a Poland-China herd boar to the University of Nevada.

The Imperial County farm bureau schedules hog auctions at Brawley, March 4; El Centro, March 18. A third sale will be held on April 2, place yet to be announced.

Fresh air and sunlight combat disease in the stable. Dairy barns should be airy barns. Ventilation is conservation.

The farm bureau of Madera County held a hog auction on the 17th at Madera.

Consignment of the Hollywood Farm

Hollywood Wash.

TO THE

California Breeders' Sale at Sacramento, March 27th, 1919

A Daughter of a 35 pound cow, sired by a 32 pound sire and heavy in calf to Judge Segis.
A Daughter of a 31.5 pound cow, 27,860 pounds milk and 1127 pounds butter in 365 days and from a 33 pound sire, in calf to Judge Segis.
A Daughter of a 30.14 pound cow, 21,800 pounds milk and 891 pounds butter in 365 days and from a 30.4 pound sire with three 31 pound daughters, also heavy in calf to Judge Segis.
A 22.6 pound two year old granddaughter of Korndyke Abbekerk and from a 32 pound sire, also in calf to Judge Segis.
Three beautiful yearling heifers all from better than 31.3 pound dams. The six nearest dams of each one of them average over 31 pounds butter in seven days.

He is one of the best Sons of King Segis, and remember that it took Sons of this great sire to produce the only 50 pound cow, the 46 pound and 40 pound Champions of the Holstein Breed. Through his above mentioned Daughters and their records, Judge Segis has proven himself a sire of wonderful transmitting ability, regardless of the breeding of the dams of his Daughters or any special combination of blood lines.

His breeding is the very best. His opportunity with the Hollywood Herd of over three hundred head is great. Should he live but a few more years, his tested Sons and Daughters will exceed all others. Expert Judges have scored him 97 per cent perfect, and he is at eight years old as active as a two year old.

Choice of Grain Feeds for Dairy Cows

With feeds at following prices, and no silage available, will you suggest a ration for Holsteins giving from 16-40 pounds per day: Bran, $50; copra meal, $57; cottonseed meal, $72; Sure-Milk, $57; barley meal, $58; corn, $73; alfalfa molasses, 60 per cent-40 per cent, $45; beet pulp, $48; alfalfa hay (good quality), $30. Your advice will be appreciated.—F. M. E., Claremont.

Prof. F. W. Woll of the University Farm answers:

The cheapest grain feeds at the prices given are doubtless beet pulp, wheat bran, and alfalfa molasses feed, in the order given, or probably with barley meal as number three. It is not likely, however, that there would be much choice between alfalfa molasses and barley meal at $45 and $58 per ton, respectively, as regards the amounts of nutrients furnished for a certain amount of money. Beet pulp, wheat bran and alfalfa molasses may be mixed in the proportion of two parts each of beet pulp and bran and one part of alfalfa molasses, all by weight. This will make a very palatable and economical combination of grain feeds and one that will make an excellent supplement for alfalfa hay, since it combines a large proportion of digestible carbohydrates with a medium amount of protein. Since it takes from 2 to 2½ pounds alfalfa hay to supply similar amounts of nutrients as one pound of common grain feeds, it will be readily seen that the former at $30 per ton is relatively high priced. A rather high proportion of grain feeds is, therefore, preferably fed to all high producing cows in the herd and to promising young heifers, viz., one part of grain for every four parts milk produced. Medium or low producers in the herd, on the other hand, will not be likely to give economical returns for more grain than about one pound for each five pounds of milk. The other feeds given are relatively expensive at the prices quoted and would not, at any rate, be likely to improve the ration suggested.

Contaminated Milk

We have a Jersey cow giving three gallons of milk a day but the cream is so strong that I cannot use it. I only let the cream set 12 hours, and when churned the butter is likewise strong. She is fed oat hay and bran.—Mrs W. B. A., Vacaville.

The condition you describe may be due to several causes. It is possible that the udder may contain some infection, but usually such a condition is the result of contaminated utensils. There are certain organisms that lodge in the seams of buckets, pans, and strainers, that will cause the milk to become strong, and as your letter would indicate that you only notice the condition in the milk after standing, we are inclined to believe it due to the utensils. Thoroughly sterilize all utensils by scalding and dry them in the sun or over a stove. If the condition persists it is probably due to udder infection, in which case a veterinarian should be consulted. Neither of the feeds mentioned would cause the trouble.

Curing Goat Skins

Would some kind reader of the California Cultivator give me any information in regard to curing skins? I have three very fine Angora goat skins and would like to know what process they should go through to cure them with hair left on. The skins are dry and hard, nothing having been done to them since they were taken from the goat several weeks ago.

I would like to have them, when finished soft and pliable, so that they may be used as rugs or for other purposes.—G. W. R.

Here are two methods of preparing fur. We shall be glad to hear of others. To prepare skins for making ladies boas, muffs, capes, etc., take the skin off whole by mutting from hock joint across vent to hock joint on opposite side and draw the pelt off over the head and cut off at a point back of ears; or, if the ears are to be left intact, let the cutting be done on a line extending around the point of nose. Then place the pelt on a stretcher made of half-inch board six inches wide at the top and four inches wide at the bottom. Cut this in two parts, from end to end. Stretch the pelt over the two, place edges together and rub salt over the pelt while fresh, and then sprinkle with powdered alum and allow it to dry. When about dry remove from boards and rub with the hands until dry. Then skin will be as soft and pliable as buckskin. Place your pelts where there will be plenty of fresh air, yet not in the direct rays of the sun.

Another method is to tack the skin taut, the fur side under, on a board, and after scraping the bits of fat off, moisten all over and sprinkle with a mixture of seven parts salt and one part pulverized alum. Leave about two days to absorb the salt. Then wet it again and repeat the mixture. About the fifth day wet it again and sprinkle with a mixture of two parts alum and one part salt. When dry it is cured and can be taken off the board. The above is from the Belgian Hare Guide.

Thirty-Two Pound Cow in the Freeman Herd.

E. E. Freeman, Modesto, has some splendid official records in the making in his herd of registered Holsteins. The full aged cow Verona Hengerveld of Glen Eva has made over 32 pounds butter in seven days and is still going strong. She is a daughter of Sir Skylark Ormsby Hengerveld, making the fifth of his daughters to make over 30 pounds. Julia Clothilde of Sleepy Hollow, also a full age cow, has 29.80 pounds butter to her credit in seven days. In some ways the most interesting record under way is being made by the beautiful junior two year old heifer Belle Faskie De Kol Witkop, who already has 24.85 pounds butter to her credit in seven days. She is an outstanding individual and is a daughter of Belle Faskie Hengerveld De Kol 2nd, grand champion cow at 1918 California state fair. Mr. Freeman's herd is headed by Segis Pontiac De Kol Dutch, a son of Segis Pontiac De Kol Burke and Miss Dutch. Thus the three nearest dams of this bull are all cows with records above 1000 pounds butter in one year and the seven day records of the three average over 30 pounds butter. His individuality is fully up to his breeding and Mr. Freeman has a fine lot of calves by him out of the splendid cows he is developing.

Fine Herefords to Pacific Islands.

One of the choicest collections of Herefords to leave this country for the Hawaiian islands, was loaded at San Francisco this week.

The cattle were selected by James Wight, who has spent several weeks visiting the leading herds of the country. Included in the shipment were 16 bulls, 11 females and two calves.

Heading the list of bulls was the great senior calf, Choice Mixer, secured in the record breaking Mousel Brog. sale at $5150. This calf, a son of the famous Beau Mischief, is a youngster of rare promise. He is especially thick throughout, is nicely balanced, and is fronted with a magnificent head. Ten of the bulls—all calves—were secured from the Gable herd of Esparto.

The females represented some of the choicest breeding available and are of the character that will be a credit to the breed on the islands.

In speaking of the cattle situation on the islands Mr. Wight said:

"The Hawaiian Islands are really the cattleman's paradise. We have a wonderful climate, an abundance of feed and water, and our market is quite satisfactory. Just now there is a growing interest in better cattle of all kinds, with the interest especially keen for Herefords, as they seem to 'fit in' to better advantage.

"Some very high class herds are already in existence, and I predict that before many years cattle from the Pacific islands will be known to American show yards." When asked if the island trade preferred Eastern cattle to California-bred stuff, Wight said: "No. As a matter of fact we would much prefer to get our cattle here, but they are not to be had in this state. I secured part of my bulls here, and considering the age, they were quite as good as I could get in the East. California can produce good cattle—and does—but not enough of them."

Sales by Winsor Ranch

Winsor Ranch, Bonita, reports great demand for top Duroc-Jersey bred gilts. Mr. Walker writes: "It is perfectly normal as the demand and prices paid in the Middle West states are unheard of but on a cash basis, and the animals sold in last year's sales are returning a handsome profit.

"We have recently sold eight gilts bred to Great Model and Grand Golden Model, to Mr. Swett of San Fernando Valley; a boar and four gilts to J. T. Weight of the Imperial Valley; a sow bred to Great Model to Mr. Stevenson of Van Nuys; a boar by Great Model and out of our twice grand champion sow, Model Defender Lady to the Beaumont Milling Company of Beaumont; have also sold three sows, two boars and 20 youngsters to farmers around San Diego. We are practically sold out of gilts but still have five extra good boars, nine to ten months old that are sired by Great Wonder, the 955 pound Iowa grand champion, and Great Model, the sire of all the under six months winners at the Liberty Fair this year. We have sold 000 feeder hogs in the last 30 days and so most of our stock is pure bred sow. We hope in another year to have enough pure breds to raise feeders enough to consume all our feed so we will not have to buy grade feeders. We are enlarging our pure bred herd all the time with purchases from the best, buying nothing but the real tops. We now have in our herd five sows by the Iowa grand champion, Great Wonder; two by Grand Model, two by Grand Model Again (a son of Grand Model and Model Lady 3rd), one by Cherry Chief and out of a Proud Col. dam, five by the great Nebraska sire, Top Sensation, one by Cherry Friend, a son of Orion Cherry King, and second prize senior junior at the National Swine Show 1916, one by Grand Model 8, the first prize boar at Iowa 1917, one by the $2500 Grand Model Supreme, besides 30 gilts we have kept for our own use, sired by Great Model and Grand Golden Model and out of such sows as our Model Defender Lady and Cherry Blossom and some of the sows mentioned above.

True Models

Left, Great Lady, by Great Wonder and Model Lady 4th., first prize junior yearling Riverside 1918, weight 570 pounds. Center, Model Defender Lady, grand champion for two years at Riverside. Right, Cherry Blossom, by Cherry Chief, grand champion Riverside 1916, three and one-half years old and mother of 53 pigs.

LONDON LIKES AMERICAN BRED PERCHERONS

In announcing a special sale of 200 high class heavy draft horses of the American bred Percheron grade type by the director of remounts of the British army, the London Times says: "They have been specially selected for sale in London in response to many requests from users of heavy horses, including farmers. These draft horses are of the class which has done so well on active service. They are all powerful, healthy, and clean legged and are chiefly of the predominant colors, grays and blacks."

At last we will be able to make love to something more than a pair of eyes. —S. F. Chronicle.

Good qualities are jewels that only good breeding can set off to advantage.

This Champion
Brown Swiss
—a five-year-old, has made the remarkable yearly production record of 16,804.4 lbs. of milk and 727.64 lbs. of butterfat. Every dairyman has cows that could produce far more than at present, if they were as perfect in health as this animal.

No matter how well you feed your dairy cows, remember they have vital organs that get out of order. And nowadays there's

A Premium on Health!

Never before has it paid so handsomely to get every extra pound of milk from every cow in the dairy. You can see the profit in milk, now.

The digestive and genital organs are the seat of practically all disorders in cows. Barrenness, Abortion, Scouring, Retained Afterbirth, Lost Appetite, Bunches and other cow ailments usually arise from "forcing" the cow's production without aiding nature in the rebuilding process.

KOW-KURE has met with great success in the treatment and prevention of cow diseases. It acts on just the organs that the troubles start in—toning them up and aiding the cow to produce and reproduce with regularity. Its effect on the milk flow is direct and positive.

Send today for your free copy of our book,

"The Home Cow Doctor"

It gives much general information of value to dairymen.

PUBLIC SALE
45 REGISTERED 45
HOLSTEINS

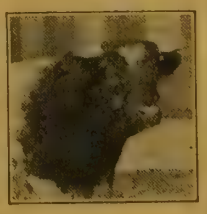
Having decided to retire from the breeding and dairy business, Mr. E. R. Putz has instructed us to sell his entire herd at public auction on his farm near

LATON, CALIFORNIA
Wednesday, April 2, 1919

The registered Holsteins in the herd, about 45 head in all, carry some of the best blood of the breed. It will be an opportunity to secure some very promising cattle. The females include

TWENTY-FOUR GREAT GRANDDAUGHTERS OF PONTIAC KORNDYKE
THREE DAUGHTERS OF ARCADY PONTIAC WAYNE HENGERVELD
THREE DAUGHTERS OF PRINCE BEAUTY PIETERTJE SEGIS

The herd sire, PRINCE LUNDE KORNDYKE 2ND will be sold. He is a fine individual and is sired by a son of PONTIAC KORNDYKE.



45 HIGH GRADE HOLSTEIN COWS AND HEIFERS will also be sold, and dairymen will find a good clean lot of milking stock in this sale.

Every animal tuberculin tested and sold subject to retest by the buyer.

for officially authenticated butterfat records is offered by the Holstein-Friesian Association of America for the purpose of furnishing reliable data as to the merits of the Holstein-Friesian breed as butter producers. This method has demonstrated the unequalled ability of the breed. These cows hold all A. R. O. records for amount of butter.

Marketing Livestock by Motor Truck

GETTING a bunch of live stock to market quickly while getting is good—before a drop takes all the joy out of a season's profits—is one of the things motor transport is enabling farmers to do. Uncertain railroad transportation and car shortage have led to a marked increase in the number of fat hogs, sheep and cattle hauled to market in motor trucks during the last year. The fat stock travel with greater comfort and are not so long on the road where the truck supplants the train for hauling purposes.

Although the movement of live stock to market by motor usually costs more than that by railroad, this extra expense is more than balanced by the rapid delivery of the stock on the market which is effected before the market price has much opportunity to fluctuate. Furthermore, when the lorry is used, as a rule, hogs from a single farm are loaded in one truck and hence there is less liability of the animals fighting in transit as compared with conditions in the average carload of mixed hogs shipped by rail.

In investigating the extent of motor truck transportation to the Omaha live stock market, the United States department of agriculture found that during the last forty years the movement of live stock by wagon to South Omaha from farms within a radius of five to 25 miles of that market has been fairly large. Development of better highways and more rapid means of transportation, that is, the motor truck, has extended the territory from which the stock is hauled. Fat animals now are being hauled by trucks to South Omaha from farms at much greater distances than those formerly served by wagon. A number of commission firms cater particularly to the motor truck, or less than car load trade. Their business is increasing, because many farmers are purchasing trucks for the special purpose of delivering live stock to the market.

Motor truck companies with from one to four trucks have been formed in various towns and cities within a radius of 50 miles of Omaha to accommodate the demands of the farmers for such service. These companies are developing not only the live stock trade of the market, but also a "back haul" trade of groceries, merchandise and general freight such as feeds, fertilizers and other farm supplies. On the morning of September 5, 1918, between 5:30 a. m. and 8 a. m., 40 truck loads of live stock were delivered at the Omaha stock yards, and of this number 19 of the vehicles were owned by farmers.

The charges for hauling stock by motor truck vary with the distance to market. Some of the companies charge a flat rate of 25 cents a hundred pounds to the Omaha market, and add one cent or more a hundred pounds for the distance hauled. Other firms charge by the load from $10 to $15 for the trip, depending on the distance from the farm to the market and the number of animals carried. Although the hauling charges at present are considered extremely high, as the truck hauler charges 50 to 60 cents a hundredweight as compared with 12 to 15 cents a 100 pounds freight rate, still the general tendency seems to be for a greater number of farmers to use the motor truck method as profitable.

The carrying capacity of the truck varies with the size, age, class and weight of the animals. A standard two ton truck, on the average, will carry about 20 head of medium weight hogs. The floor space of the truck, when small stock such as sheep and hogs are transported, is often increased by double decking the machine. Usually in mixed truck loads of cattle, hogs and sheep, the maximum carrying capacity of the truck is not utilized. As a rule, the companies operate large trucks of from three to four tons capacity, while the majority of the vehicles owned by farmers are from one to two tons.

Figures indicate how the motor truck delivery of live stock at the South Omaha freight yards has increased during the last two years. During the first nine months of 1917 only 52,129 hogs constituted the Omaha "drive in," which included the animals conveyed to market either in wagon or motor vehicle. There was an increase of 90 per cent during the same period in 1918, 142,220 hogs being delivered by wagon and motor truck, the increase resulting largely from the use of the motor truck. In the case of cattle, the "drive in" during the period from July to September, inclusive, 1917, aggregated 12,189 head, while in the same period in 1918 it amounted to 17681 cattle.

Motor Trucks Are Used Extensively

The Cincinnati, Indianapolis and Louisville markets receive a large proportion of their hog supplies directly from the farms, motor trucks being used as conveyances. One typical, double deck truck load of live stock unloaded at the Cincinnati stock yards in the presence of a representative of the United States department of agriculture, consisted of three head of 850 pound cattle, seven calves weighing 150 pounds each, and 11 hogs averaging 185 pounds. Another large load consisted of seven cattle each weighing 750 pounds, while still other truck loads, dependent upon the size of the trucks, were made up of from 10 to 25 hogs which weighed from 175 to 225 pounds each.

The custom in hauling by motor truck to the Cincinnati market is to charge a flat rate of from $15 to $30 a trip for the use of the large truck to convey the live stock from 15 to 40 miles. One shipper reports that he hauled 25 hogs a distance of 43 miles in four hours, and that the actual shrinkage of these hogs, which weighed approximately 200 pounds apiece, was from six to ten pounds. The trucks engaged in the regular business of hauling live stock to Cincinnati increase their income by carrying feeds, fertilizers and other supplies back to the farm.

Other Increases Found

At Kansas City a marked increase notable in the local "drive in" has resulted largely from the increased use of motor trucks. During the first eight months of 1918, a total of 72,887 hogs were handled by motor truck and wagon, which is an increase of 21,505 over the same period in 1917. Denver, Colorado, makes note of an increase of 223 per cent in sheep, 12 per cent in hogs, and 13 per cent in cattle in the local "drive in" during the first eight months of 1918 as compared with 1917. At St. Joseph, Missouri, the "drive in" during the last year has more than doubled as a consequence of the extensive use of trucks. During a single day at St. Joseph, 1400 hogs, 200 cattle, and a considerable number of sheep were brought to the market, largely in 190 motor trucks.

With good, permanent roads on the boom in all sections of the country, and transportation by motor truck more satisfactory in every way, the department of agriculture investigators believe that the future promises cheap and efficient marketing of many of the smaller animals by means of power vehicles. The effect of market fluctuations is reduced to the minimum, because, in the main, only a few hours are required for the market trip by motor trucks.

Anchorage Farm Berkshires in Demand

Mrs. Ruth Hardy, California's first live stock woman, who is responsible for the establishment and development of the famous Anchorage Farm herd of Berkshires, Orland, received proper recognition for her efforts in helping to make good the Berkshire slogan, "Berkshires on Every Farm", when the members of the Western Berkshire Congress unanimously elected her to a directorship of that organization.

When the Anchorage herd was established early in 1917, Mrs. Hardy secured the boar Star Leader, from the University herd, and when she paid $1500 for him she showed keener judgment than Professor Thompson who sold him!

Star Leader, a son of Grand Leader 2nd, is conceded by all to be one of the most remarkable boars that the breed has produced. He is not only a great individual (and there are those who claim that he is the greatest individual Berkshire boar now living), but he is responsible for many very high class sons and daughters. So popular has his blood become that Anchorage Farm enjoys a very wide and growing demand for his get, as is indicated in the following list of sales, 15 of which were shipped in one week. All are either sons or grandsons, daughters or granddaughters or are bred to a son of Star Leader:

To T. W. Ringer, Seattle, two boars and five gilts; T. W. Mayhews, Sacramento, two bred gilts; to Elsie Davis, Yuba City, one boar; to Frank Gilloon, Sisson, one boar; to Peter Sieth, Palo Cedro, one boar; to Gee Brothers, Corning, a boar and gilt; to W. H. Paxton, Nevada City, three bred gilts; to G. W. Cornwell, Santa Cruz, two bred gilts; to Mrs. J. T. Varley, Bakersfield, bred sow; to L. W. Meyers, Walnut Grove, bred sow; to G. W. Williams, Rackerby, a boar; to S. M. Coates, a trio; to C. W. Wilson, Paynes Creek, a boar; to R. G. Gillette, Marysville, a bred gilt; to Mr. Eible, Willows, two gilts and a boar.

Training Offered to the Wounded

A FORMER bell boy injured at Chateau Thierry, with practically no education and outlook for the future, has been given a short course in an automobile school by the Federal Board for Vocational Education and placed in a large garage, where he is earning a good wage and learning the mechanism of the car, so that his earning capacity will increase.

A young man of ability wounded at Belleau Wood, a member of a family of physicians, who had been trying to earn enough by occupations for which he was untrained, to put himself through medical college, is being given one year of a medical course with the prospect of continuing the training if it proves to be suitable.

Another young man, a physician, lost both his legs in the Argonne and so could not return to general practice. He will be given graduate training so that he may carry on office practice as a specialist.

One young sailor who was prepared to enter medical school lost his hearing from shell concussion, and is being given a course in lip reading to be followed by a course in bacteriology.

One case, typical of many, is that of a young man with general farm experience, who is physically unable to do the heavy work of the farm, because of rheumatism incurred in one of the cantonments, and is being trained in scientific farming, so that he can be placed as a manager with the expectation of ultimately managing a farm of his own. Another who has grown up on a small farm, asked for a course in motor engines and tractor operation, so that he could go into partnership with his father on a large farm suitable for tractor cultivation, as he was incapacitated by an artificial limb for general farm work.

A man of thirty, whose previous occupation required the handling of logs and heavy machinery, but who had read books on engines and electricity is being given a course in electrical station operation, because an injury due to shrapnel to his back makes heavy work impossible.

A stone mason, with some knowledge of stationary engines, lost his left arm at Chateau Thierry, and is being given training in gas and stationary engine operation.

Common Sense Training

"There is no mystery about the work of retraining war disabled men so as to make them 'efficient'," today declared Dr. Chas. A. Prosser, director of the federal board for vocational education. "It is simply the application of good common sense education and good judgment. It is merely the utilization of the abilities remaining to the disabled man, which can be as trained as in most cases to be ju

as effective if not more so, than the ones which he lost by reason of his injuries.

"It is surprising the number of things a man is capable of doing. If he has been engaged in an occupation which requires the use of his legs, such as operating a foot power press, we do not throw away his trade knowledge, but he is educated to use his hand, or perhaps the stump of his leg by means of a special adjustment, and can continue doing that which he knows best just as well as before he received his injury, or if he is disinclined to continue that work, he is reeducated for some other phase of the same industry which he knows well, and which appeals to him, thus preserving his trade knowledge.

"This reeducation is given in the various industries and factories as well as in the leading technical and trade schools of the country. It is absolutely free to the disabled man; if he is single, he is given $65 a month support fund, all other expenses being paid, and if married or there are other dependents, a larger allowance is made.

Skilled Farm Labor.

Labor is the great problem on the farm at the present time. War conditions and abnormal wages in the various lines of industry have demoralized farm help to such an extent that it is exceedingly difficult to get assistance requisite to carry on operations.

In this state of chaos the Federal Board for Vocational Education has hit upon what seems to be a solution, and has created a brand new profession —that of "farm mechanic," and it is figured that any farm of more than 100 cultivated acres can very well afford to have a man of this sort.

The men being qualified for this work are disabled soldiers who before injury were farm boys. With this background of agricultural knowledge these men are being taught to operate modern tractors which do the work of many teams and men. They are being taught operation, care and upkeep of motor trucks and other gas engines. They are being given a general course in looking after all machinery used on modern farms, and indications are that the supply of these specially trained men will not begin to equal the demand. Farm hands who before the war could not hope to make more than $25 or $30 a month as laborers can by becoming proficient as farm mechanics, qualify for positions paying from $100 to $125 per month with steady employment the year around.

It is an exceedingly interesting development of our national rural life brought about by forces of necessity, and is but another illustration of the well known fact that the emergency is usually met in one form or another.

Farm boys who have been discharged and are disabled as a result of their services either by sickness, accident, or disease, would do well to write to the Federal Board for Vocational Education, Washington, D. C., and obtain the particulars of this training which the government provides free for its disabled men.

A NEW ENGLAND CHAMPION COW

Rag Apple Aaggie Colantha 233800, a four year old pure bred Holstein cow, bred and owned by the D. W. Field Farm Company, of Massachusetts, has recently given evidence of her wonderful inherited producing ability by giving 346 quarts of milk during a seven day official test; the fat contained in this milk being equal to 41.24 pounds butter. For seven consecutive days this remarkable cow averaged 49 quarts of milk per day; giving on her best day 51 quarts, while during her 30 day test she gave 1380 quarts, or an average of over 46 quarts. Her butter production for the 30 days was 163.68 pounds, and this record entitles her to second place in the list of highest producers for the 30 day period, the leader being Ormsby Jane Segis Aaggie, known as "the great white heifer," the only cow that ever made two seven day butter records each over 40 pounds. Rag Apple Aaggie Colantha is in splendid physical condition and still in test, producing around 100 pounds milk and over four pounds fat per day. Her average daily grain ration is 24 pounds.

This New England champion comes from a family of high producers; her dam, Dutchland Colantha Aaggie Cornucopia 110176 being a 34 pound daughter of the famous Colantha Johanna Lad, sire of so many great milk producing daughters. Her granddam is a 30 pound cow and her great grandam is the noted Aaggie Cornucopia Pauline, a 34 pound cow which stands at the head of the only 30 pound four-generation group of cows in the world.

WHY CROWE LIKES HEREFORDS

S. R. Crowe of Haywards, who in partnership with Clifford B. Harris of Los Angeles recently purchased 80 head of Hereford breeding cows from George Watterson of Bishop, now has his herd installed on a ranch situated between Haywards and Pleasanton.

Messrs. Crowe and Harris made an equal division of the lot and the Harris cattle were shipped to Missouri where they will be prepared for the forthcoming Harris sale.

Practically all the cattle secured from Watterson represented the Repeater line of breeding made famous in the O. Harris herd.

Among the 40 head retained by Crowe, 30 are of rather direct Repeater breeding and six are out of Repeater dams. Most of the cows are now in calf to the service of a Bonnie Brae bull.

Mr. Crowe saws that it has always been his ambition to own a herd of registered Herefords, as he believes them to be better adapted to the range than any other breed. He arrived at that conclusion a good many years ago when he was operating a cattle outfit in Northern California. It so happened that he was carrying a good many whitefaces at the time and shortly after winter "broke" he suffered a severe accident that sent him to bed for 16 weeks. That winter turned out particularly bad. Hay was scarce and help short and before the snow melted a lot of his cattle died. Every day his men would bring him bad news which naturally did not hasten his recovery. Finally, however, he was able to get out.

"I expected to find that I was just about out of the cattle game," Crowe said in relating the story, "but when I checked up on my stuff I found I wasn't so bad off as I had figured. Of course my losses were pretty heavy, but I found this out: Most of the stuff that pulled through had white faces and was able to walk. That winter made a Hereford man out of me."

FIRST 1000 POUND COW IN TULARE COUNTY

Hertinga Willis, a registered Holstein cow owned by W. J. Higdon, Tulare, has completed a 365 day record of 23,963.5 pounds milk and 1003.25 pounds butter, the highest yearly record to date in Tulare County. The junior two year old Madrigal Mooike 2nd finished with 20,160.3 pounds milk and 751 pounds butter in 365 days, which gives her the California milk record in class. Of the seven day records recently completed in the Higdon herd, Leda Hartog Ormsby 2nd made 25.46 pounds butter from 548.9 pounds milk. Wayne of Rock Martha has 18.76 pounds butter to her credit in seven days and is still on test. She is a two year old daughter of Wayne of Rock, the good cow that recently completed a yearly record of 802 pounds butter in one year. Herdsman Harry Redd has some more good ones that will be heard from shortly.

NEW CROPS FOR CALIFORNIA

Special crops are needed for conditions near the coast of California and in the mountain districts, where the weather remains cool at all seasons and many crops fail to grow or to reach normal maturity, and the United States department of agriculture is conducting experiments with a number of plants, many of which have been imported for this purpose. Special interest attaches to the possibility of securing varieties of potatoes and other root crops from the high table lands of South America, which are able to grow under conditions of low temperature. Numerous other food crops, fruits and useful trees that grow successfully in the cooler mountain regions of South America are being studied to determine their possibilities of use in California. Among these are varieties of Indian corn from the cool table lands of Peru, including the remarkable large seeded Cuzco type of maize.

PROPER FORM FOR SCREW DRIVER END

Almost everyone uses the screw driver more or less, yet how seldom, even among mechanics, do we find it properly ground. To be sure its uses for all purposes from that of a can opener, a clam hammer to that of a crow bar precludes the point being ground in the form to best serve its real purpose, that of driving screws. If neat work and good smooth heads for the screws, when in place, are desired, then grind the screw driver bit square across the end with sides flat and parallel back a distance equal to the depth of slot in the size screw to which the driver is adapted. This leaves the edge somewhat weaker than the old wedge shaped end so commonly used. However, if the bit is made of good tool steel properly tempered, it will give much better service with much less effort required. A. Cammack, Colorado Agricultural College.

APRIL 9 DATE OF HEREFORD SALE

Under the auspices of the Pacific Coast Hereford Cattle Breeders' Association approximately 75 head of registered Hereford cows, heifers and bulls will be sold at public auction at University Farm, Davis, on Wednesday, April 9. The offering will consist of drafts from leading Pacific Coast Hereford herds, and it is expected that the sale will accomplish much in disseminating the blood of some of the best families of the breed still further throughout the West.

60 REGISTERED 60
Holsteins
AT PUBLIC SALE

We will sell the entire milking herd of registered Holsteins owned by W. F. Mitchell, on his farm near

Visalia, California
Thursday, April 3, 1919

This is one of the best herds in the San Joaquin Valley, one that has been built up through years of constructive breeding by the present owner.

There are many official record cows in the sale, up to over 31 pounds butter in seven days.

PRINCE HISKE WALKER the well known Mitchell herd sire, will be sold and most of the females in the sale are bred to him. This bull would not be offered for sale at all but for the fact that his young daughters will be retained as Mr. Mitchell's future breeding herd.

Every animal tuberculin tested and sold subject to retest by the buyer.

Retained After-birth

Cows can be made to clean easily without using force.

When cows do not clean properly after calving, it indicates a germ infection which is likely to run through the entire herd and result in Abortion and Barrenness.

The after-birth should be removed at once without force by means of the B-K douche and the cow treated to prevent her becoming an aborter or sterile. Authorities state that while there is no absolute cure for abortion and sterility, nevertheless the infection can be controlled by prompt treatment and the animal saved for successful breeding.

B-K is scientifically correct for this work. Used as a douche for the uterus, it quickly brings the after-birth, dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K does not cause straining, but is soothing and heals the tissues.

Send for "evidence" and free Bulletin No. 52 "Contagious Abortion." If your dealer does not have B-K send us his name.

Bulk Handling of Grain Pays

Bulk harvesting and storage saved an enormous amount of money, time and labor this year on the Moreing Brothers ranch north of Sacramento. The harvesting cost, even with their old steam tractors as motive power to pull the combined harvesters was exactly 50 per cent less per day than it would have been if the grain had been in sacks. The saving of labor in warehousing the grain reduced to less than half that ordinarily required for handling in sacks. Losses due to leaking sacks, weather damage, fire, rats, mice and other vermin, as well as through theft, was almost totally eliminated.

Thousands Saved

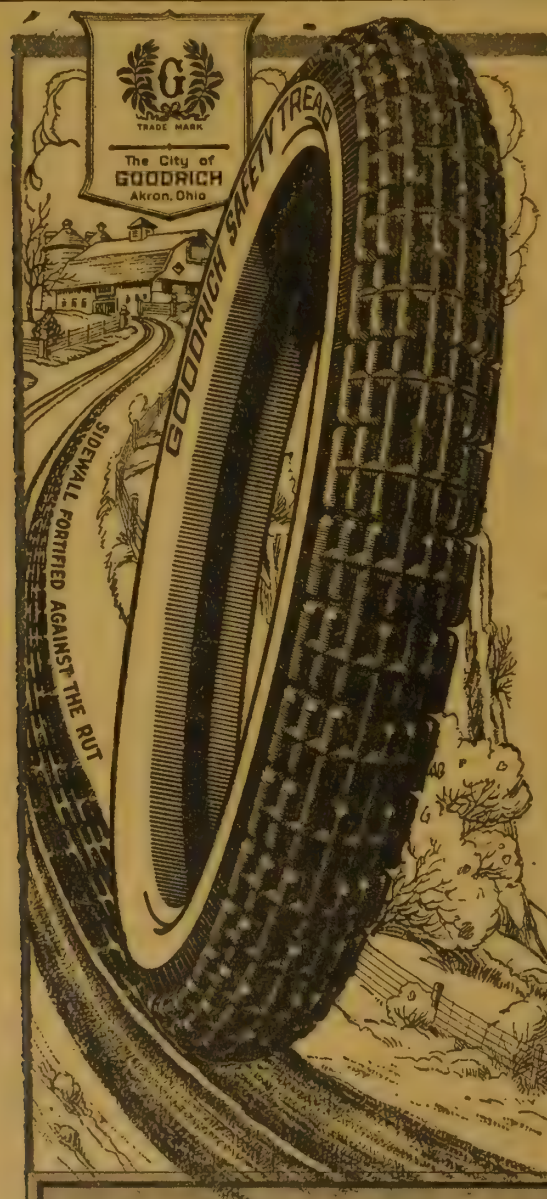
According to estimates, based on the quantity of wheat harvested, and handled this year, more than $43,000 worth of sacks, at the prevailing price, was saved by handling this crop in bulk. Last season, when the yield per acre was slightly greater on the virgin land, the bulk handling methods instituted, saved the costs on 294,000 sacks. The jute sack committed suicide on that ranch the year previous both because of the extra cost of sacks and the cost of extra labor to harvest the grain in sacks.

Harvesters Easily Changed

It is a simple and comparatively inexpensive matter to fit bins to the combined harvesters, lengthen out the bucket elevators which convey the grain to the sacking spouts when sacks are used, so that grain is delivered into the bins. These are about 4½-ton capacity on the large 34-foot combines used on the Moreing Brothers ranch. Each is fitted with a spout, which permits the delivery of the wheat into grain tight wagon boxes, which are driven alongside. The Moreing Brothers' operations are so large that 45 of these tank wagons, hauled by four-horse teams, were necessary to keep up with the seven or eight big combines.

Reduced Labor Costs

Grain is as quickly and easily dumped from the wagon box to a hopper at the grain warehouses on the property, or located at convenient points along the levee, and a simple bucket elevator and screw conveyor, working in a trough, delivers the grain to the several square storage bins in the long corrugated iron building. Only two men were needed for the unloading and storage work at the Moreing warehouses, which is in sharp contrast with the sweating crew of sack buckers, trucking the sacked bins into the ordinary warehouse, under most conditions of grain handling in California.



Metal Grain Bins

Bulk handling of grain in California has demonstrated its economy of time, labor and money costs for sacks, as well as in the 25 per cent savings from fire losses, weather damage, inroad of rats, mice and other vermin, and theft, by the use of small metal grain storage bins in a number of parts of the Sacramento and San Joaquin Valleys. Progressive farmers here and there have found a way in which they could increase their financial income from their grain cribs by preventing these profit reducing charges and losses, and the small metal grain storage bins and small, efficient tubular steel elevators have come into use in a number of places.

NO MORE GERMAN SEED FOR BRITAIN

That it would not trade with Germans for five years was the decision reached by the Agricultural Seed Trade Association of the United Kingdom at its annual meeting held in London. The possibilities of growing in Great Britain seeds of grasses hitherto imported, chiefly from Germany also were discussed. The question of providing more adequately for better seed testing and grading throughout the country also was under discussion in connection with the decision by the board of agriculture to establish a national institute of agricultural botany at Cambridge. Members of the trade through the association have contributed $75,000 to this institute where it is hoped to establish a center for testing seeds both for germination and purity. There was no reason, in the opinion of the members who discussed the matter, why London should not now become the recognized station for at least the whole of Great Britain, as Zurich was looked upon as the central testing station for practically the whole of Europe before the war. It was agreed that whatever method of testing was finally decided on, it should be one that would satisfy not only Great Britain but also the Continent and America.

That agriculture had been almost, if not quite, the "most controlled" industry since the outbreak of the war was the statement made by Lord Selborne at the annual general meeting in London. If a considerable section of the population had learned that agriculture was the most vital industry, and that its welfare should be the first duty of the state, the trials of the producer would not have been in vain, he said. It was probable, however that its trials were only beginning. It was certain that reconstruction as conceived in some quarters would threaten the prosperity if not the actual existence of the agricultural industry. It therefore behooved everyone concerned with its well being either as producers or friends of the rural community to organize themselves with a more earnest spirit than had obtained hitherto.

They Shorten The Road to Town

THE distance between farm and town today is a matter of tires. Goodrich Tires will shorten the distance for you—shorten it in cost, and shorten it in wear and tear of the trip.

Were Goodrich Tires made expressly for country roads, they could not better meet the special needs of the automobile on the farm.

Their extra thick, extra wide SAFETY TREAD, with the Goodrich interlocking safety bars spreading to the sidewall, lay more tough rubber and more non-skid safety tread on the road—their overlapping tread and side strip fortify the sidewall against the grinding and scraping of deep ruts—and their whole burly, broad shouldered structure fits them for farm service.

For a high-powered car use Goodrich Silvertown Cords.

In your heavy hauling, Goodrich Truck Tires furnish the same low cost full-work-day service.

A farm on a Goodrich basis saves money.

Buy Goodrich Tires from a Dealer

GOODRICH TIRES

"BEST IN THE LONG RUN"

THE HACK SAW

Almost any kind of a tool kit is incomplete without a good hack saw. To the mechanic it is almost indispensable, while to the man who does his own repair work on machines or about the farm its usefulness is great.

In choosing a hack saw, keep the following points in mind: The frame must be rigid or it will twist out of line when the blade is drawn tight. The blades used should be as short as the work will permit, as short blades are less expensive and less liable to breakage. The frame should be arranged so the blade may be turned at right angles to the usual position for special work.

In using the saw remember that oil should never be used on the work as it tends to glaze the surface; enough pressure should be used to keep the teeth biting freely and not allow them to scrape and glaze the surface; the blade should be drawn tight when in use and the tension released when not in use, if the frame is to be kept in good condition. Forty strokes per minute is about all the ordinary blade will stand without heating, and washing down the points of the teeth; for thin metal or tubing, blades having 24 teeth per inch should be used; for general work 14 teeth is best.

Few hand hack saw blades are ever worn out by proper use. Hard material, fast running and twisting usually account for their destruction.—A. Cammack, Colorado Agricultural College.

DIAMOND CUT DIAMOND

Butcher—"This pound of butter you sent me is three ounces short."

Grocer—"Well, I mislaid the pound weight, so I weighed it by the pound of chops you sent me yesterday."—Boston Transcript.

TIME TO CUT IT

"Don't you think her voice ought to be cultivated?"

"No, I think it should be harvested."—Boston Transcript.

The Cultivator Patterns

8990—Ladies' Slip On Waist. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The fastening is on the shoulders, as the waist slips on over the head.

8986—Boys' Suit. Cut in sizes 2, 4, and 6 years. The blouse is cut in a point, and the separate trousers are straight at the lower edge.

9005—Ladies' One Piece Slip On Apron. Cut in sizes 36, 40 and 44 inches bust measure. The apron is open as far as the waistline at center front, so that it can be quickly slipped on.

8971—Ladies' Slip On Waist. Cut in sizes 36, 38, 40 and 42 inches bust measure. The front of the waist is all in one piece and is cleverly cut so that it forms a square plastron.

9000—Ladies' Dress. Cut in sizes 36, 38, 40 and 42 inches bust measure. The four-gored skirt has a plain panel at the front and is gathered all around at the slightly raised waist-line.

8983—Girls' One Piece Dress. Cut in sizes 2, 4, 6 and 8 years. The dress is softly gathered at front and back of the round neck, which is bound with a bias roll of the material.

8993—Ladies' Four Gored Gathered Skirt. Cut in sizes 24, 26, 28, 30 and 32 inches waist measure. The yoke is cut in tabs at the waistline and buttons onto the belt at each side.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

THE ROAD TO LAUGHTERTOWN

Oh, show me the road to Laughtertown,
For I have lost the way!
I wandered out of the path one day,
When my heart was broken, my hair turned gray,
And I can't remember how to play!
I've quite forgotten how to be gay,
It's all through sighing and weeping, they say,
Oh, show me the road to Laughtertown,
For I have lost the way!

Would ye learn the road to Laughtertown,
Oh, ye who have lost the way?
Would ye have a young heart though your hair be gray?
Go learn from a little child each day,
And catch the lilt of his laughter gay;
Go serve his wants and play each day,
And follow his dancing feet as they stray;
For he knows the road to Laughtertown,
Oh, ye who have lost the way!
—British Weekly.

FRANCE REPLANTING ORCHARDS DESTROYED BY HUNS

THE fury of the invading Germans knew no bounds. Not satisfied to terrify defenseless citizens, to burn cities, to carry off rich furnishings, jewels, grain and cattle, they even wreaked their spite on the trees of northern France. Woodland and orchard were laid low. Proud trees that stood sentinel along the white French roads—cherry, pear, peach and plum, whose delicate blossoms filled the spring with perfume, whose ripening fruit laughed in the sunshine—cut down, ruthlessly, and left prostrate where they fell, or injured sufficiently to insure slow though certain death—for retreat had sounded and the enemy must be left "haught but his eyes to weep with!"

It is down at "Petit Trianon," where the gay belles and beaux of Márie Antoinette's court had disported in the simple garb of peasant folk, that the "Pepiniere National" (National Nursery) has been established for the cultivation of plants and trees for the restoration of the devastated regions. One day in December, 1916, Lieut. Georges Truffiant, of the French army, wandered through the fields about Versailles—fields that had only mothered the flowers, only known the light footsteps of powdered marquises and the slippered tread of court ladies—and it was the idea of this practical soldier that this very ground should give of its best for France. So Trianon, long captive of weeds and wild nature, with the exception of a few stately elms and cedars, became, in April, 1917,the "Pepiniere Nationale de Versailles."

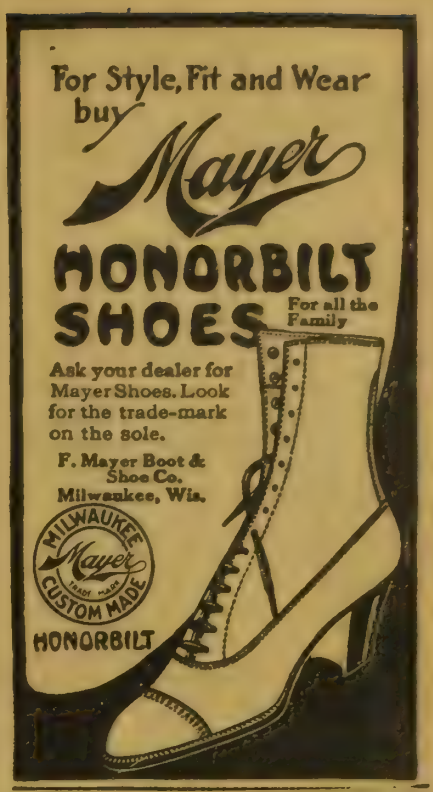
This was the beginning of a nation-wide movement and the nurseries thus established throughout interior France have not only furnished millions of fresh vegetables for the soldiers' mess, but many thousands of trees and saplings that have been and are being transplanted through the northern departments, replacing those that have fallen under the merciless axe of the Hun.

The reconstruction of the French orchards involves the planting of at least 2,000,000 trees. France, with characteristic resource, has provided funds to meet the expense. There is a subvention made from the fund of three million francs appropriated by the chamber of deputies to the national office of agricultural reconstruction. This portion will be used for the replanting of trees in the invaded regions only. Then the interest and support of the Touring Club of France has been enlisted, insuring propaganda and publicity not only in France but throughout the allied countries. Already much encouragement in the way of financial aid has come from private individuals and societies, among them the American Red Cross, which gave its check for $10,000. Recently 10,000 live fruit trees were shipped from the United States for transplanting in French soil.

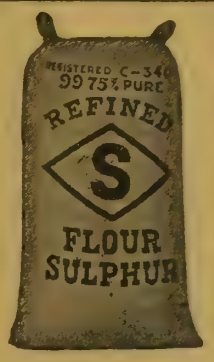
We needs must think of the murdered trees of France when we look out at our own blossominbg orchards and the green-gold of our forests smiling in the sunshine. Thankful, indeed, are we that the sacred temples of America's quiet woods have been spared the desecration of the despoiler. We are glad that our trees are to stand in place of those that have fallen and as our men have died, there on the long battle line, so will their youth and vigor rise anew in the flowers and fruit of France, carrying on the great scheme of nature, the perfect circle of "the resurrection of the body and the life everlasting."—The Red Cross Bulletin.

THE MAN WHO TAUGHT OUR NAVY TO SHOOT

In the December Boy's Life William Heyliger gives a sketch of Rear-Admiral Sims in the course of which he relates the story of Sims' battle for target practice in our navy:



"Back in 1901 he was a lieutenant attached to a warship of the Asiatic fleet. He studied gunnery—morning, noon and night. He believed that when a gun was fired, the shell should hit something. He knew that in the battle of Santiago, in the Spanish-American War, the American warships had scored but one hit for every one hundred shells fired. At the time no other navy could show any better marksmanship; nevertheless, those ninety-nine misses worried him.



"In China he met a young British naval officer who, also, had ideas about gunnery. The British officer was experimenting with a tube that when attached to a big gun fired a very small shell. The tube pointed exactly as the gun was pointed. By mathematical calculation the accuracy of the big gun could be determined by firing the small tube at a miniature traget.

"Sims was quick to see the possibilities of the idea. He made one of the tubes and attached it to the gun he himself commanded. Because of the great cost of shells it was then, and is now, impossible to have much traget practice with the big guns. But Sims drilled his crew day after day with his tube attachment. If he saw other naval officers smile at his experiment, he paid no attention. And when general target practice was next held the crews that Sims had patiently and tirelessly drilled out-shot the whole fleet.

"After that Sims had but one idea; that every gun crew in the navy should be drilled in the new way. He wrote a long letter to Washington. But the navy department was busy with a thousand and one routine duties; and besides, a new idea always has had to struggle hard to oust the old and the accepted. Sims wrote again and again; weeks gave way to months and still he continued to mail his letters. Finally, when there seemed no other way, he wrote to Theodore Roosevelt, then president of the United States. Back came a cablegram ordering him to report at Washington.

"There the determined young lieutenant was granted an interview with the president. In those days it was

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste — (Atomic Sulphur) — and for dusting.

For Lime Sulphur Solution, use our DIAMOND "S" BRAND refined Flour Sulphur. We can furnish you this sulphur at such a low price that it will pay you to mix your own solution.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our Diamond "S" Brand Powdered Sulphur. Write direct to

San Francisco Sulphur Co.

624 California Street, San Francisco, Cal.

We are equipped to make immediate shipment. Send for illustrated booklet; price list and samples, and please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Tel. Kearny 871.

Save 1-2 on Fuel

CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns distillate costing only 7½ cents per gallon in cook stoves, heaters, furnaces, pasteurizers, boilers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes, address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

CALIVADA
Sheep MANURES Steer

From highest nitrogenous feed. Decomposed and concentrated by age in their own liquids, containing the highest percentages of Nitrogen, Phosphoric Acid, Soluble Potash, and readily available Humus.
Shipped commercial dry. Cars average 22 to 24 tons. Saves four-fifths labor in application. Thousands of tons now being shipped to citrus and deciduous growers in California.
Write for samples, prices and particulars today to insure prompt deliveries

the custom in all the navies of the world to be content if shots struck anywhere near a target. Sims argued that shells that struck 'near' enemy ships were wasted. He asked for a real target and an actual count. If shells were being wasted something should be done. And that 'something,' to the dogged mind of Sims, was the method he had proven when his gun-crew had out-shot the Asiatic fleet.

"After all the weary months he was at last given his chance. The target President Roosevelt provided was an abandoned lighthouse rigged with a great spread of canvas. With fast-beating heart Sims watched a fleet approach and fire salvo after salvo. When the last gun had spoken the canvas was examined. Only one shot had reached its mark. Sims had proved his case."

AUNT ABBYS CALLER

"I declare," said Aunt Abby, falling weakly into the nearest chair when she had closed the door after a departing guest, "I'm about tuckered out."

Her young niece, Caroline, looked at her in astonishment.

"Why, Aunt Abby," she exclaimed, "what is the matter? I always thought that you enjoyed people more than anybody I ever say. I didn't suppose that they could tire you."

"They can't, most of them," Aunt Abby replied, "but I must confess Mrs. Eli Hewett is too much for me; I always feel as if I'd been drawed through a knothole after she's been here for an afternoon. She isn't interested in one mortal thing except herself. I kept count today to sort of keep my spirits up, and I tried her on twenty-seven different things and people, and she wasn't interested in any one of them—not in church or missions or flowers or bead work or cooking or the doings of society; she wasn't even interested in the new minister's wife, which, to be sure, was so remarkable that it seems as if I might have counted that to her credit.

"Folks complain that Laura Potter can't talk about anything but clothes, or Mis' Little about anything but her house, but land sakes, I could talk with either of them all day, and have a real good time. There's lots of interesting things about clothes and housekeeping if you set yourself to discover them. It's the folks that ain't interested in anything that wear on me.

"Caroline Tucker, if you ever get into that state of mind you make it a matter of of prayer and don't you give up till you get interested in something if it's nothing better than shoe-strings."

"Yes, ma'am," Caroline replied, with suspicious meekness. "Do you suppose music and tennis and my Campfire Girls, and how to raise money to rent and furnish a room for them, and retrimming hats so as to make people think you have new ones when you haven't, and poetry and stenciling, and trying to get hold of little Bob Haywood, and neighbors and neighboring, and—"

Aunt Abby's eyes met her niece's laughing, but unabashed.

"I didn't say you were in immediate danger, Caroline Tucker; but all the same, it won't hurt you or anybody else to remember what I said," she declared.

Good opportunities are lost to the lover who knows not how to embrace them.

Rain, rain, come today, with your gripsack packed for a nice, long stay.

"DON'TS" IN THE USE OF THE SEWING MACHINE

Don't forget to oil the sewing machine frequently. The treadle and pitman should be oiled in their bearings almost as often as the working parts above the table.

Don't allow the machine to stand uncovered when not in use, as it collects dust and lint. The working parts below the cloth plate should be dusted and lint removed frequently with a small camel's hair brush. The parts above the cloth plate should be wiped often with cheese cloth.

Don't run the machine when the presser foot is down and there is no material in the machine, as this roughens the under side of the foot and blunts the feed.

Don't run the machine while it is threaded without a piece of material under the foot, as this causes the thread to knot around the bobbin and makes a big, ugly bunch of thread on the under side of the work when stitching is begun. There is often a tendency on the part of the operator to stitch several inches after the end of the seam has been reached. This is a bad practice.

Don't pull the material while it is being stitched, as this causes a stretched, tight, ugly stitch and very often blunts or breaks the needle. The feed will take care of this unassisted and will push the material through as fast as the machine can take care of it.—Beryl Dixon, Colorado Agricultural college, Fort Collins, Colorado.

HOME MADE SOAP

Make soap of fats which cannot be used for cooking.

First clarify the fat. Melt it up and add water, bring to a boil, and allow to cool. The fat will form a solid cake on the top of the water. The impurities may be removed from the bottom of the fat. Melt fat again and heat until all water has evaporated, till bubbling stops. Then slice a medium sized potato into the fat and strain through a dry piece of cheese cloth.

To each five pounds of lukewarm grease use one small can lye, one quart cold water, one-half cup hot water, three tablespoons borax, one-fourth cup household ammonia, two tablespoons sugar, one teaspoon salt.

Mix lye and cold water, let stand till cold, stirring occasionally. Mix one-half cup hot water with three tablespoons borax. Let this cool and add one-fourth cup household ammonia, two tablespoons sugar and one teaspoon salt. Pour lye into grease slowly, stirring continually with a wooden spoon or spatula. Add other mixture, stir until light and thick. Pour into an enameled pan lined with paraffin paper. Crease before soap gets cold. Louise F. Lacey, Colorado Agricultural College.

RECIPES CALLING FOR USE OF BEET SYRUP

Chocolate Cake

1½ cups mashed pumpkin
1½ cups beet syrup
2-4 eggs
½ teaspoon salt
4 teaspoons baking powder
3½ cups white flour
2 squares chocolate

Mix the syrup and softened fat and add the egg. Mix dry ingredients and add alternately with milk to the first mixture. Add melted chocolate. Bake in moderate oven.

Pumpkin Pie

1½ cups mashed pumpkin
½ cup best syrup
1 teaspoon salt
½ teaspoon cinnamon
¼ teaspoon ginger
¼ teaspoon nutmeg
1 egg
⅞ cup milk

Mix syrup, salt and spice, add pumpkin, slightly beaten egg and milk. Bake in one crust.

Drop Cookies

1 cup beet syrup
½ cup melted fat
2-3 cup sour milk
4 cups white flour
½ teaspoon cinnamon
½ teaspoon cloves
½ cup raisins, cut

Mix the ingredients in the order in which they are given, sifting the dry ingredients together. Drop the cookies by small spoonfuls on oiled pans and bake them in a moderate oven.

TESTED RECIPES

Southern Brown Bread.—One-half cup molasses, two cups sour milk, two spoons soda, one pint flour, one pint meal. Steam for two hours.

Nut Cake.—Three eggs, one and a half cups sugar, one-half cup butter, six cups milk, two and a half cups flour, one and a half teaspoons baking powder, four and a half cups nut meats. This is a loaf cake.

White Sugar Fudge.—Two cups white sugar, one-half cup milk; two level tablespoons butter. Cook together till a drop of the mixture will form a soft ball when dropped in cold water. Remove from fire; add one teaspoon vanilla and one-half cup raisins and beat. Chopped nuts may be added instead of the vanilla and raisins.

THE MENTONE SAGE SAYS:

The more you find fault the more expert you become.

When the right girl meets the right man there is not much more to be said except by the minister.

You are late—you've missed your date.
Fool, I'm Time—I never wait.
—Herbert Kaufman.

Poultry for Profit

Read what Portland Oregonian has to say about this book and its author. There is a woman down in California who knows more about poultry than all the men in the state, and this, too, for that matter. Her name is Jean A. Koethen, and she has written a book which is published by the California Cultivator of Los Angeles, and called "Poultry for Profit." It costs a dollar, postpaid, and it ought to be in the hands of every one who is keeping hens. This paper has reprinted a lot of matter written by Mrs. Koethen and, because of its quality, her book is recommended. Climatic conditions in these states are so nearly alike that what is good or bad for fowls there is the same here. The price of three dozen eggs will get the volume and its purchase is a good investment.—Portland Oregonian.

Send in $1.00 for book or $1.75 for book and California Cultivator.

FOLDING IRONING BOARD

This board, which is hinged to the wall, is always ready and in place. It may be hooked up against the wall out of the way when not in use. The leg is hinged to the board and falls flat when the board is lifted. With it down and in use, the leg is not in the way, and skirts may be ironed without any lifting or changing. The directions for making follow:

How to Make

Length, 57 inches; rounded at free end. Width, attached end, 15 inches; free end, 10½ inches. Leg, 58½ inches, to be changed to suit height of board; attached to board 11 inches from free end.

Board to be attached by hinges to the wall 33 inches from the floor. For use by a person above average height, the board should be higher, which will necessitate a longer leg. Board to be made of thoroughly seasoned wood one and a half inches in thickness.

Cover

Pad: Any heavy material such as canton flannel or a partially wornout blanket. Cut shape of board, allowing two inches on each side and end. Bring extra two inches to underside of board and tack firmly and smoothly in place.

Ironing sheet: Unbleached muslin (homespun). Cut shape of board, allowing four inches on sides and end and hem all around. Attach tapes on opposite sides about 10 inches apart. Tie the sheet on with these tapes. Make two sheets.

The cover and sheet may be left on when putting the board up by allowing sufficient space when adjusting the button or screw hook and eye which holds the board in place.

USING FLOUR SACKS

I notice in "A Use Everything Idea" contributed by Subscriber, Santa Ana, the various uses to which she puts flour sacks are good and commendable, the most of which I practice. Let me add a few more, which I have found very practical.

We buy 100 pound flour sacks from the bakery, and after bleaching carefully I make my husband's everyday shirts. It takes three for a shirt and they outwear anything in the order of shirts he has ever had. Contrary to general opinion they launder easily with a little care, or if preferred they could be colored a dark shade. Colored, they make excellent everyday dresses for little girls and coveralls for little boys. It is surprising how well they wear. They outlast most materials you could buy for that purpose and at the same time look neat and tidy.

Another way I use them is to cut the sack in two pieces, hem and use for individual towels. They get nice and soft after a few washings. A nice supply can be readily had, and the germ laden family roller towel can be dispensed with for the more convenient way.—Subscriber, Pomona.

* * *

In your issue of January 25, "Subscriber, Santa Ana," tells of many uses for flour and sugar sacks, and asks for further uses. Having used them in almost every way she mentions and some others, I thought I would mention them. Probably because of the almost universal use in place of the regular toweling for tea towels (dish towels) and of "birdseye" linen for babies' napkins, she does not mention these two uses.

A sugar sack, either hemstitched or plain hemmed, and with or without briar stitching (or any fancy stitch) in color, makes a nice plain apron for afternoon wear for sewing or mending, or for wear in the kitchen on baking day.

Not only my children's summer underwear was made from sacks, but also drawers for husband and myself; also nightshirts for him and my son, and night dresses for myself and daughters, two 50 pound sacks sewed together making ample length.

A meal sack, pinned with clothes pins to top of the separator tank strains the milk as it is poured into the tank.

Lastly, when money was lacking, a very good white dress for the small girl to wear to a Sunday school picnic was made from bleached flour sacks. —A Subscriber's Wife.

USEFUL IN THE HOME

A bottle of good vinegar is very useful to the housekeeper, and then many good home remedies can be made with this as an ingredient and at very small cost.

To keep window glass bright, dip a cloth in vinegar, rub over the glass and polish with soft, dry cloths. Soaking new wicks in vinegar 24 hours before placing in lamps insures a clear flame.

To mend tiling and holes in plastered walls mix plaster of Paris with vinegar instead of water, let stand 15 minutes, and it can be nicely smoothed over.

To clean soiled wall paper, dip a whitewash brush into hot vinegar and brush all over quickly. When the paper is dry it will appear fresh and new looking.

Equal parts vinegar, turpentine and linseed oil makes one of the best furniture polishes, but the furniture must be washed with soapsuds before using polish.

Keep a mixture of corn meal and vinegar on the washstand and rub the hands with it after each washing, and it will help to keep them soft and white. This is especially good to use if the hands are chapped and sore.

A saturated solution of boric acid is very useful in any home as it is a splendid first aid remedy for burns, cuts and small hurts of all kinds, and runarounds and various discharging diseases are disinfected and healed by being freely washed with it, and there is no safer or more effective remedy for boils and styes than this boric acid solution. This solution is easily prepared and at almost no expense by adding a heaping teaspoon of granulated boric acid in one pint of either distilled or boiled water. To sterilize your hair brush after washing and drying it, place it in a shallow pan containing enough of the boric solution to cover the bristles, then remove and dry in the usual way. The comb should be sterilized as often as the brush, and they should be washed and disinfected often if there is any disease of the scalp.

One can have the hands in strong soapsuds without injury to the skin if the hands are dipped in vinegar immediately after. Vinegar and cooking soda in solution are said to be a sure cure for warts, but they must be kept moist with it several times a day to obtain the best results.—A. H. H.

SINK MATS OF FRUIT JAR RUBBERS

One should never use rubber jar rings twice for canning, so many good, solid rings seemed to be about the most worthless things in the world until I made a discovery. Now I save them carefully. To my horror, I discovered that my white enameled sink, the pride of my kitchen heart, showed scratches. Something had to be done. Folded paper pads proved mussy; a wooden rack needed lots of care to keep it sweet; a wire mat or rack under the pots and pans became rusty.

At last I evolved a mat made by laying rings flat in rows and tying together securely. The best of the discarded rings are used double to make it heavy and thick enough. That is, one on top of the other, and then tied together with heavy strong cotton cord, weaving over and under several times and tying securely at each joint. The over and under idea is to make the mat lie flat and keep its place. They can be boiled in soap and water like the towels if necessary to keep them sweet. I am now savings rings for a bath tub mat.

SAVORING RICE WITH HAM

Boil a cup of rice in two quarts of salted water for 20 minutes, having the water at a galloping boil when the rice goes in. Drain and add a cup of hot milk, into which you have stirred two raw eggs, two tablespoons of grated cheese, and a tablespoon of butter. Mix well, add half a cup of boiled ham, chopped fine; put into a greased mold and steam for an hour and a half. Turn out on a flat dish and pour over it a sauce made by cooking together a tablespoon each of butter and flour with a cup of milk, and when these are smooth, stirring into it a tablespoon of grated cheese. Salt and pepper to taste.

Potato and onion. What a salad for Saturday night when you don't expect company!

Choose the Dealer First Then the Piano

A good reliable Piano Dealer will only offer good dependable pianos. Their names may be unknown to you—but his name is not. If he is known as a good reliable dealer then you are safe—you can rely upon his statements and his advice—and your choice of a Piano will give you many years of satisfaction.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, Player Music, etc.

Giant Winter **RHUBARB**

NOW BEST TIME TO PLANT

Should return from $1,000 to $1,500 per acre first year. If interested in Rhubarb or Berries, write for special prices. J. B. WAGNER, Rhubarb and Berry Specialist, Pasadena, California.

Use Great Care in Selecting Breeds

By T. E. Quisenberry

YOU should have all your pens selected and mated by this time and be ready to hatch at least a few early chicks. Some of the pullets entered in the American contest at this place (Leavenworth, Kansas) are not mature enough to lay. This is especially true of the American and English breeds. All of these pens will no doubt make good records, but look how much better their showing would have been had they laid well in November and December. The Red, Wyandotte, Orpington and Plymouth Rock pens which were mature have laid well during the past two months. And look at the high priced winter eggs that the owners of late hatched chicks are cheating themselves out of. These early hatched birds also make very good breeders for next year.

More depends upon selection and breeding than any other one thing. When you go into your yards to select your matings, you should go "with fear and trembling." You should try to eliminate disqualifications and serious defects and follow the Standard as closely as possible. You should also give at least equal consideration to the general health, vigor and egg laying qualities of your birds. In selection for egg production you will not go far wrong if you use the Hogan system if you haven't trap nest records to depend upon.

How to Make Selection for Egg Production

The rules that govern selection are as simple as A, B, C to any observing person. For instance, a hen that is slow to feather is lacking in vitality. Anyone ought to know that. You can't stuff her and make her lay eggs. She is by nature a weakling. Hens do not lay eggs because they want to; they lay because they are strong and vigorous and egg laying is a natural result which they cannot avoid. That tendency must be bred in them.

Why, if the average farmer would give half the attention to his poultry that he does to his live stock he'd find the poultry the best investment in many cases. Success comes from being willing to discard.

Before mating your birds for another season, take one more look at them, and keep the following rules in mind when making your selection:

1. Market those which have been slow to feather or seem to lack vitality.
2. Keep the pullets which matured quickly and started laying first. Those which start laying when less than 200 days old will be the best layers if they have the right care.
3. Keep the late moulters.
4. Keep the birds with rather large, plump combs and wattles.
5. Hens with pale vents, pale beaks and pale legs have been good layers.
6. The skin of the best layers should be rather loose and flabby on the abdomen between the vent and breast bone.
7. The pelvic bones must be thin, straight, flexible and wide apart.
8. Market the hens which are baggy behind and which have a heavy, fat, thick abdomen which hangs down below the point of the breast bone.
9. Keep the hustlers and heavy eaters that go to bed late and with full crops.
10. Birds that have long toe nails that show no signs of being workers are usually unprofitable.
11. If a bird meets the above requirements, it should have a broad back, long body, be stoutly built and in good flesh.
12. If a bird is not moulting and still has a small dried up comb covered with a sort of whitish substance, or if a bird has thick or crooked pelvic bones, which will be found on each side of the vent and above the point of the breast bone, these are always money losers.

No man or woman can afford to keep and feed a flock of drones at the present prices of feed, but the good layers will make more profit than in any previous year.

Uses of Corn

By Jean A. Koethen

While corn is perhaps the one grain which can least easily be spared by the poultryman, it has its limitations and cannot be used exclusively nor at all times with all birds. A glance at the table of composition of poultry feeds shows why this is so.

Corn is five per cent crude fat and 4.2 per cent of this is digestible. It is 10.30 per cent crude protein, of which only 8.6 per cent is digestible, while 63 per cent of its 70 per cent of starches and sugars is digestible. Now compare that 4.2 per cent of digestible fat with the 1.14 to 1.8 per cent of digestible fat in wheat, and the .4 per cent in barley, and it is easy to see why corn cannot be fed ad libitum. It is too heating for warm weather, and, what amounts to the same thing, too fattening for laying hens unless balanced by other grains. It is absolutely necessary to the well being of growing chicks, absolutely necessary, in limited amounts, to production in Leghorn hens in winter, the best fattening feed for turkeys and young market stock (except milk), the best feed for sitting hens, since their bodily heat must be maintained under trying circumstances, but it must be used with caution for laying hens, especially of the heavy breeds.

A hen that is fed corn to the exclusion of other grains has not all the material she needs for making eggs. She can make the yolk, for that is largely fat, but she lacks the protein necessary for the white. Being supplied with more fat than she can use in eggs, she does the only thing she can do with it, piles it onto her own body, and the fatter she gets, the less able is she to lay. Sooner or later, if she does not die of liver trouble first, her intestines become so coated with fat that laying is out of the question.

What is true of Indian corn is true in a lesser degree of Milo, Kaffir and Egyptian corn. They are all too fattening for constant and exclusive use, though all excellent feeds when balanced with barley or wheat.

WISE PRECAUTION

Lebanon has sent a delegation to Paris to look after her interests. Wonder if they fear that some one wants to change the name of the cedars of Lebanon to the cedars of some departed statesman.—S. F. Chronicle.

Two Dollars Net in Bad Year

Written for California Cultivator By Jean A. Koethen

WHEN a flock of hens can be made to net an average of $2 each under such conditions as prevailed last year, no little credit is due to both the hens and their owner—to the hens for real bred to lay qualities, to their owner for scientific management and persistent industry. That such a record should have been made by a woman—if it could be made by anyone—was to be expected.

When Mrs. C. Fromm started her poultry operations with a small flock on an acre of ground in Glendale eight years ago, she began with White Wyandottes. She still has some Wyandottes, but she has found that the Single Comb White Leghorn, while it may not lay many more eggs than the Wyandotte, lays them at a smaller cost per dozen than any other breed, so her flock of 300 hens now consists almost entirely of White Leghorns. In the beginning Mrs. Fromm sold hatching eggs and baby chicks, operating several large incubators in one room of her home, but market eggs proved to be her most profitable line, and she finally turned all her energies in that direction, hatching only chicks enough to keep up her flock. Last year, between January 1 and October 1, her 300 hens averaged $2 each net. In the month of October they just broke even, and in November and December the amount received for eggs was about $20 less than cost of feed. Toward the end of January, when I visited her, her yearling hens were averaging 33 per cent and her pullets 60 per cent.

Mrs. Fromm's Sensible Housing System

Mrs. Fromm's system of housing is quite different from that usually seen in Southern California. Instead of the one large house, accommodating several hundred layers, she uses the colony house, designed for not over 50. These houses are nine feet square, covered with tarred paper. A door in one end admits both attendant and hens. The front, which is toward the south, consists of two canvas covered frames, hinged at the top, which may be raised or lowered at will, with a large window sash between them. By this very simple means a maximum of light, air and ventilation is secured.

The houses for pullets and breeders are the same width as the colony houses, but twice as long. Mrs. Fromm has found that a breeding yard of five cockerels mated to 70 hens gives better results than separate pens of one cockerel and a dozen hens. Fertility in her flock this year is from 90 to 95 per cent. That is, out of every hundred eggs set she is hatching from 90 to 95 live chicks.

Mrs. Fromm's hens get no breakfast, except the dry mash which is always accessible in their hoppers, and any grain which may be left over from the night before. At noon they are given all the sprouted oats they will clean up, and at night a scratch mixture composed of milo, Egyptian corn, hulled barley and cracked corn. Every other day 25 cents worth of green cut bone is distributed among them.

All the chicks hatched on this little ranch are hatched in incubators. As soon as they are rested after hatching they are carefully transferred to the brooder house, which is heated by hot water and contains runs and hovers for 300 chicks, 50 chicks to each hover. In this brooder house the chicks get all the sunshine there is through windows at the level of the floor, and on warm, sunny days the window is raised so that they may have free access to the runs outside. On chilly days, when raising the entire window would chill the brooder runs too much, a board with a small door cut in one end is inserted beneath the raised sash, so that the chicks may go in and out without cooling the house. The chicks are fed milk mash and commercial chick feed from the time they are hatched till they are five weeks old, when a gradual change is made to the laying mash and coarser grains.

At about six weeks of age the chicks are removed from the brooder house to small roosting coops, each in its own run, at the rear of the brooder house. These coops are made of dry goods boxes, each two and a half to three feet square, and their inside furnishing consists of a slatted roost with box beneath. When the chicks are put into the coops the boxes are filled with straw, and here the chicks sleep until they are ready to roost. No teaching is required. As soon as they wish to roost they roost, and it is not long till every chick is on the perches. They remain in these little coops till the cockerels are ready to be marketed as broilers, when the pullets are sent to the pullet house, and another lot of chicks from the brooder house comes into the coops.

HELPING THE FOOD ADMINISTRATOR

One industrious war gardener is pictured as working busily and reflecting on the virtue of raising his own food supply.

"If everybody grew his own vegetables and ate less meat," he soliloquized, "we'd put old Bill on the bum in a hurry. This is tough work, but I'll stick to it if it kills me. I'm with Hoover on this."

At this point a fine assortment of earthworms was unearthed. The digger's reflections immediately shifted to a shady stream and the final scene shows him happily fishing.

"Oh, well," he reflects to soothe his conscience, "vegetables or fish; it's all the same to Mr. Hoover."

LIST OF PUBLICATIONS OF U. S. D. A.

A complete list of the publications that have been issued by the United States department of agriculture and those now available for distribution has been revised to July 1, 1918, and published in circular form by the department. Farmers' bulletins, department bulletins, circulars, separate reprints from yearbooks, and reports are listed together in alphabetical order. The circular states that no publications are sold by the department of agriculture, but copies will be sent free upon application to the Chief, Division of Publications, Department of Agriculture, Washington, D. C., as long as the supply lasts. When the department supply is exhausted publications can be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., by purchase only. The list of publications includes those that can be obtained free from the department as well as those which can be purchased from the superintendent of documents.

EGGS WITH WHITE YOLKS

One of the features of the University of Missouri college of agriculture exhibit at the St. Louis Poultry Show was a number of eggs with white yolks. These were produced in experiments conducted by the poultry experiment station at Columbia upon the effects of different colored feeds in producing the yellow color in plumage and shanks of birds and the deep color in yolks of eggs. It has been found that the yellow pigment which gives the color to the shanks of birds makes yellow yolks and causes creaminess in white plumage, is a substance known as xanthophyll. This is the principal pigment of yellow corn and is also found in green food and most other feed stuffs. By feeding a ration free from xanthophyll, Professor Kempster has been able to produce Leghorn pullets and cockerels with perfectly white shanks, beaks, earlobes and plumage. These pullets fed on the white ration lay eggs without any color in the yolks.

After seeing this exhibit poultry fanciers will realize the importance of reducing the amount of pigments in the rations fed to white birds intended for the show. Egg producers will see the advantage of feeding yellow corn and other feeds rich in color to laying hens to produce the deep colored yolks desired in market eggs.

YOU can't help getting jimmy pipe or cigarette makin's happy every time you fire up with Prince Albert—it pleases you so fair and square. You just can't get enough hours in the days and nights to put to smoking purposes. That's the situation!

It's never too late to hop the fence into the Prince Albert pleasure-pasture! For, P. A. is ready to give you more tobacco fun than you ever had before. *That's because it has the quality, the flavor and the fragrance!*

Soon as you know Prince Albert you'll say that P. A. *did not* bite your tongue or parch your throat. *And, it never will!* For, our exclusive patented process cuts out bite and parch and lets the man with the touchiest tongue simply smoke his fill all the time.

Toppy red bags, tidy red tins, handsome pound and half pound tin humidors—and—that clever, practical pound crystal glass humidor with sponge moistener top that keeps the tobacco in such perfect condition.

R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

A "Superstition" Becomes a Scienc

YOU have heard them say—the old farmers in the neighborhood in which you were brought up—that when the little, late, stunted cocklebur weeds, an inch or two high, began to mature their burs, it was time to get the late crops under cover because frost would be along in a few nights. The catkins on the maple trees had something to do with early gardening. The women used to watch for blackberry blossoms—had something to do with planting beans, didn't it? And either the opening of the elder flowers or the ripening of the elder berries fixed the time for some summer operation—maybe it was sowing turnip seed, or it may have been harvesting the early onions. And there was a great deal more of the same kind. Nearly every field and garden operation depended on some tree or flower—a mass of misinformation, interesting as folk lore and all that, but utterly useless as aids to productive farming.

That is what you thought, perhaps. It is what a great many thousands of people have thought. All those "superstitions" did not fit in with the little bit of cocksure science that every boy and girl learned in school. It was merely something for well meaning old fogies to putter around with and for well informed people to smile at.

Not Mythical, Says Science

Comes, now, the United States department of agriculture and says that such lore is not superstition and never was, that it is not useless and never was, but that, on the other hand, it is, and has always been, one of the most accurate aids possible to the right sort of agriculture. Here is the opinion in the language of one of the department's scientists:

"Properly recorded and correctly interpreted, there is nothing perhaps to equal the records of the dates or periodical events in plants as indices to the bioclimatic character of a place or local area, because such events are in direct response, not to one or a few, but to all the complex elements and factors of the environment which no artificial instrument or set of instruments yet available will record."

What that means, in plain language, is that there is a best time for every farm and garden operation, and that some tree or shrub or plant indicates that best time more accurately than all the scientific instruments can possibly register it.

The only restriction is that this nature lore with relation to crops, be "properly recorded and correctly interpreted". The "superstitions" that you smiled at were, all the while, the basis of a very useful and very exact science—only nobody had ever systematized it.

Phenology Can Help Agriculture

"Very little specific study," says the same scientist of the department of agriculture, "has been made in this country of the subject of index plants do determine their relation to different periodical events in farm and garden practice, especially with reference to the relative value of different species and varieties as to the constancy of their periodical responses to seasonal influences year after year. Therefore, it is apparent that among the subjects requiring thorough systematic investigation that of the relation of phenology to agriculture is among the most important."

You see, this system that the old fogies followed was the science of phenology—only it was not scientifically got together. "Phenology" means the science of phenomena. No human being has ever yet known it in its completeness. Many hundreds of years ago a wise man, though probably an unlettered one, picked up a bit of it here and there and practiced it and told it to his children, and they practiced it and in turn told it to their children. So it came down by word of mouth through many generations, with accretions here and there, every generation adding a little, but each generation likely to confuse and wrongly apply what it had inherited from the preceding generation. Some of its results may have been wrong, because men failed to remember accurately or to apply properly what their grandfathers had told them or what they had learned for themselv but, on the whole, it doubtless h worked beneficially, and now a begi ning is made toward converting it in an exact science.

You can have no idea of just ho scientific the thing is. It is all full such terms as "phenological meri ians", "bioclimatic law", "isophanes "theoretical time constant". It aboun in such equations as "isophane 4 minus 34b equal 10 isophanes times equal 40 days later'. It involves pla ted curves, graduated diagrams a world maps with zig-zag lines runni through them. It is the most math matical, geographical and biologic "superstition" you could imagine.

Practical with Hessian Fly

The Hessian fly may be said to ha started it all. Its depredations we such that it was necessary to so wheat so late that the Hessian f would not ruin it and yet early enou that it would get a start before ve cold weather. The department of a riculture undertook to establish a sy tem of planting dates for every se tion of the United States in whi wheat is grown. It was not possib to make investigations in every fie to determine the right time for pla ing. What had to be done was establish one correct time and wo out the others from it. The rule w laid down that the season, in gener varies four days for each one degr of latitude, five degrees of longit and 400 feet of altitude. That perfectly good, workable rule. A di calendar and other mechanical devic have been got out to aid the farm in applying it. By it, any farmer a determine about what time he shou sow his wheat. But he cannot de mine by it exactly what time should sow his wheat. And it wou work out the same way for planti any other crop. No two seasons a just the same. The date that is rig this year may not be right next ye

But if, on the day that was right planting cotton this year, the locu trees were just coming into bloom, t probability is that the right day n year will be the day on which locust trees are beginning to bloo though it may be ten days later ten days earlier than the year befo If, for five or ten or any number years, it is determined that the b day for planting cotton seed is day on which the locust trees are ginning to bloom, the blooming comes a pretty reliable index as when to begin planting. That, course, is a suppositious case. cust blooms are not known to ha any relation to cotton planting t But the time for sowing winter wh has been determined upon as period between the time when the late goldenrod is in full bloom the time when the white common J anese clematis flowers are nearly gone or the leaves are distinctly ored on the dogwood and hickor At least, that is the verdict of Dr. D. Hopkins, the scientist of the partment of Agriculture who has be quoted several times before.

Applying the New Science

And that is what the application the science of phenology to agric ture will be when it is worked ou a definite something in nature will indicate the right time for do a definite thing in the farm operatio It will be rather a slow process. Hopkins has worked out forms gathering index material on pra cally all trees, shrubs and plants, nual and perennial, wild and cultiv ed, with regard to the various cro In the course of years, qualified a cultural experts will gather and s tematize the data.

In the meantime—well, any indiv ual farmer may have some of his r ural phenomena indices wrong, but is likely to have a good many of th right. If he will use his own pow of observation and his own judgme he can correct them for himself fr time to time. Any intelligent farm who will take the trouble can w out a pretty good system for hims And the Department of Agricult will be able to give him more more aid from year to year.

Dr. Hopkins has recorded the sults of his work in a Weather Bur publication entitled "Periodical Eve and Natural Law as Guides to A

ultural Research and Practice," but t is too technical for the average eader—in fact it is not meant for the verage reader. At the present stage f the investigations, reports of prog- ess are for scientific workers. As he research develops workable, re- iable indicators they will be an- ounced. After all, the successful ractice of phenology is individual ap- lication of observation and common ense to the common things around he individual.

ROADS AS DIVIDEND PAYERS

If a farmer saves an hour a week by being enabled to use good roads as opposed to bad roads, it would mean 52 hours a year; estimating the use of man and team as being worth $6.00 a day, this means a saving of $31.20 a year.

Suppose his farm is assessed at $10,000, and the additional tax levy due to the issue of road bonds by the county runs to $1.00 per thousand, which would mean $10.00 a year additional taxes as against a saving of $31.20 on time alone. This means that he is investing $10.00 and drawing dividends of $31.20, an interest rate of 312 per cent.

The farmer doesn't need to stand for this. Collectively he is the political power in his community. What he wants he gets. His vote assures that.

Isn't the answer this, Friend Farmer: Impress on the law-making and bond-issuing authorities that you demand good roads; that it costs you money not to have them. Won't you get them? Most assuredly you will.

SEEKS OUTLET FOR BREWERS' RICE

Rice mills and other large holders of brewers' rice have appealed to the bureau of markets of the United States department of agriculture to find an outlet or new uses, through investigations, for their stocks which are accumulating because of the approach of national prohibition. Although such rice might be made into rice flour, dealers and mills report a decreased demand for rice flour since the restrictions on the use of wheat flour were removed by the food administration, and doubt whether the making of additional rice flour would be profitable. In addition to the stocks of brewers' rice there are also large holdings of low-grade rice and screenings which are at present unmarketable. The department is giving attention to the problem.

THE AIRPLANE IN AGRICULTURE

In connection with scouting and other survey work in Texas, the United States Department of Agriculture is putting the airplane to its first practical application in agriculture. A tryout of this method of survey was made last year along the Trinity River and resulted in the discovery of several outlaw cotton fields in heavy timber, which had previously escaped detection. This year the airplane is to be used more extensively. It has been found a valuable aid in pink bollworm work, as it makes possible the easy mapping, by means of photographs, of the quarantined territory, and facilitates the inspection work in forested areas, especially in such long stretches of country as the valley of the Rio Grande and its tributaries.

KELP POTASH SOLD TO NEW YORK FARMERS

A carload of kelp potash, produced at the United States department of agriculture's experimental plant at Summerland, California, was recently sold by the department to the Nassau (New York) County farm bureau, and has been delivered to the president of the association, Elwood B. Titus, at Mineola, Long Island. The car contained about 74,000 pounds of 33½ per cent material and was sold at $4.25 per unit, or $142 a ton. Nassau County is one of the large truck-growing counties of Long Island, and the farm bureau will probably take another carload of potash from the Summerland plant.

The Woman's Club of Three Rivers, Tulare County, protests against changing the name from Sequoia to Roosevelt National Park, and say that the change is one which "Roosevelt when living would not have approved." This is a very reasonable deduction from Roosevelt's devotion to nature worship.—S. F. Chronicle.

MARKET NOTES

Cabbage in San Fernando district was somewhat benefited by the rainfall of last week. Inspection shows a big percentage of the plants have been cleaned of aphis. A few acres will be ready to harvest next week, but not enough to justify loading straight cars.

Height of cauliflower shipping season reached the past week. Effect of the rains is seen in variable quality of stock. Heads running larger than in January. Shipments probably average close to 12 heads per pony crate. In central section black broccoli varieties not yet moving freely. Prices to growers are not yet down to Southern California levels.

The celery crop is clearing up rapidly.

Lettuce shipments this winter have not been up to the usual standard of size, firmness or volume, but reports indicate that the quantity is increasing, and the quality improving in both Imperial and Los Angeles Counties. Los Angeles County shipments have been light, but an increase is expected this coming week.

Cantaloupes, string beans, squash and corn are being planted in the Indio district.

Peas are looking very fine in Brawley district. Earlier fields are forming pods. The first express shipments will probably be out in ten days.

Peas are farther advanced in the Hayward and Half Moon districts than last year.

Acreage of Garnet potatoes in San Francisco, Colma, Half Moon Bay district, to be 2250 acres. Planting is almost finished, but plants are not yet up. The prospects are favorable.

Spinach shipped from Imperial and Coachella sections has been of fine quality and some growers secured as much as a car per acre. Four or five cars per day are being shipped from Brawley.

Honey exports, January 1-10, 1919, total 37,218 pounds, including Canada and Newfoundland 34,074 pounds, China 6000 pounds. Corresponding 10 day period, 1918, 560,808 pounds. January 10-20, 1919, total 87,860 pounds, including Canada and Newfoundland 83,887 pounds, United Kingdom and France none, Norway 1920 pounds, China 1148 pounds. Corresponding period 1918, 873,597 pounds. Total since July 1, 1918, 4,208,668 pounds, including Canada and Newfoundland 694,622 pounds, United Kingdom 2,986,856 pounds, France 492,301 pounds Norway 1920 pounds, China 6375 pounds.

Peanuts from Japan and Formosa commanded in 1918 prices double those received in 1916. The 1918 output was three and a half million bushels. Present price 7½c per pound.

California is shipping around 15 carloads daily of cabbage and cauliflower to Chicago, the heaviest buying center for these vegetables. Other eastern markets total about the same daily shipment.

Practically all stocks of dried fruit in the state are sold off.

NO BOLLWORM ADMITTED

Fumigation houses, erected on the Mexican border by the United States Department of Agriculture to help prevent further introductions of the pink bollworm of cotton from Mexico, are substantially completed and will be placed in operation in a short time. These fumigation houses, some of which will take 15 railway freight cars at one time, probably represent the largest fumigation operations ever undertaken. They are established at five different points from Brownsville to El Paso.

ON GUARD AT CROSSROADS OF THE WORLD

H. F. Dietz, an entomologist of the United States Department of Agriculture has for some time been assigned to duty in the Panama Canal Zone. The canal is the crossroads of the world and the possibility is always imminent of new and injurious insects gaining a foothold there and coming thence to the United States.

It ain't the guns nor armament, nor funds that they can pay,
But the close cooperation that makes them win the day;
It ain't the individual nor the army as a whole,
But the everlasting team work of every blooming soul.

—Kipling.

SMILO GRASS

A hardy, evergreen, perennial, drouth-resistant bunch grass, recommended by Prof. Kennedy of the Department of Forage Grass Production, University of California, who says, "Smilo Grass should not be confused with Indian or Sand Mille. Smilo Grass seed originally came from the Mediterranean district, where it is a valuable forage grass."

Prof. Kennedy also says Smilo Grass should become one of the most important forage grasses of this state, and that the seed should be scattered, or plants set, over our extensive areas of barren hills, and that Smilo Grass cannot become a pest, owing to its fibrous root system. It is easily cultivated out.

Send addressed and stamped envelope and we will mail you a free bulletin by Prof. Kennedy.

Early Fall is the best time to plant Smilo seed on the ranges of Southern California, where it can be sown broadcast, or on burnt over brush land, without cultivation, if done before Fall rains. Seed can be planted any time, providing it gets sufficient moisture to establish a root system.

When well rooted it will stand drouth.

Seed is very fine (40,000 to the ounce) and must be planted shallow, in fact, be barely covered. Do not sow thick, or you will make a failure. We find the best results sixteen inches each way, as the bunches grow very large.

Do not turn stock on Smilo the first season. Let it get a good root.

To get quick results, and to test its values, it would be well to send for a few roots. Now is the time to plant roots.

We will send one dozen for fifty cents (50c), 100 for $2.50, and 1000 for $9.00 postpaid.

Ask your dealer for Smilo seed. If he cannot supply you, send fifty cents for one ounce, or three dollars for one pound, and we will send it postpaid.

Smilo Grass has been growing on this ranch for over thirty years.

Do not write asking questions about Smilo Grass without enclosing an addressed and stamped envelope.

G. D. STEAD

Spring Valley **California**

Your Tractor Question

"Will It Do MY KIND OF WORK?"

Answered in Tractor Book

THIS Tractor Book tells all about *special abilities* of Bean TrackPULL Tractor in *orchards* and *vineyards*.

This great little 6-H.P. machine, designed by builders of special orchard and vineyard machinery for 34 years, combines a wealth of experience in one most efficient design to meet definite orchard and vineyard needs.

Don't buy tractor built for *general* use which may prove merely an expense, no matter what the purchase price.

Tractor designed to *do your kind of work* is the cheapest by far in *service-costs* per year.

Bean TrackPULL turns about-face in 10-foot circle with *full* power—tools deep in soil. You turn right back in same row.

Built low to go under lowest branches. Great traction permits

light weight, low fuel expense, and best work in soft soil.

Bean TrackPULL Tractor will be as famous as noted Bean Power Sprayer when as many are in use.

BEAN TrackPULL Tractor

New "After-the-War" Proposition

We have a new "After-the-War" proposition which includes a bond covering a liberal guarantee on one season's work of 90 days, without expense for repair parts. This guarantee bond is furnished each purchaser of a BEAN. A reduction in price is also effective at once, and guaranteed up until June 30, 1919.

Also manufacturers of famous Bean Power Sprayers

See this Tractor at either of our Branch Houses 131 N. Los Angeles Street Los Angeles, Cal. or Fresno, Cal.

LIVE STOCK

By F. P. Allen, Bureau of Markets, Los Angeles

Local buyers are paying $12 to $12.50 f. o. b. country shipping point for good steers and don't seem to be very anxious for them at those prices. In some rare cases $13 is paid when the quality and other circumstances justify that figure. These country point prices bring the cost f. o. b. Los Angeles from $13.50 to $14.50, the difference representing freight, shrink and other incidental charges. While dressed steers are quoted at $22.50 for a top, only a few head in each carload of steers received here qualify for that figure.

The same rule in a smaller way applies to live hogs. Country point prices range from $15.25 to $15.75 for No. 1 hogs, which means $16 to $16.50 in Los Angeles. All the hogs in carload lots received here are not No. 1 hogs. The receipts have been fully adequate and prices rule steady.

The quality of lambs in the receipts are a little below normal. Those of top quality find a ready market but other grades are weak on a dull market.

Yearlings and choice wethers are in good demand at firm prices but ewes are badly neglected. The sale for them is very slow and the market weak .

Live stock prices February 26:

Good steers	$13.50@14.50
Medium steers	11.00@12.00
Common steers	9.00@10.00
Good cows	11.00@12.00
Medium cows	9.00@10.50
Common cows	6.00@ 7.50
Hogs—No. 1, 175-225 lbs	16.00@16.50
Hogs—No. 2, 250-400 lbs	14.50@15.50
Lambs—No. 1	16.00@16.50
Wethers—No. 1	11.00@12.00
Ewes	8.50@10.50

POTATOES AND ONIONS

These are the actual prices obtained February 25 by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms cash on walk.

Demand and movement moderate, prices slightly lower. Closing prices Monday carlot sales to jobbers: Stockton Burbanks sacked per 100 pounds, extra fancy, $2.15; fancy, 1.80@1.90; choice, no sales reported. Idaho Russets sacked per 100 pounds best, 1.45@1.55.

Sweets, lug, 90@1.00.

Onions: Demand and movement slow. Little change in prices. Stockton, sacked per 100 pounds. Browns, best 2.00@2.10; resorted, 2.25; White Globes, 7.50@8.00; Homegrown Green Onions, 1.50 per dozen bunches.

VEGETABLES

These are the actual prices obtained February 25 by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes, doz. .....1.25@1.40
Brussels Sprouts, best, lb. .....12@14

Cabbage: Cool, clear. Demand moderate, no change in prices. Quality and condition generally good. Carloads f. o. b. cash track. Early Winningstadt, California crates, 22.00@25.00 per ton, crates extra.

Carrots, doz. 50

Cauliflower: Best in cabbage crates, 1.00@1.40.

Celery: Little change in prices, quality and condition ordinary, mostly short, carloads f. o. b. usual terms, Northern and Southern districts. Golden Hearts in California crates, 5@7 dozen bunches, No. 1, mostly 85; No. 2, 75 per dozen bunches, crates extra. Homegrowns, best 3.00@3.50; poorer, 5.00 per crate.

Lettuce: Demand good, prices advancing. Quality and condition good. Carloads f. o. b. cash track—Iceberg, California crates, Los Angeles district mostly 2.05@2.75, Imperial Valley ,district 5s 3.50, 6s mostly 3.00@3.25.

Parsley, doz. 20
Peas, Tel. lb. .....12@15
Peppers, Chili, lb., best .....22@25
Bell, lb., best .....25@30
Pumpkins, lb., best 1¼
Radishes .....15@20
Rhubarb, Strawberry, bx. .....2.25@2.50
Spinach, doz. 25
Squash—Hubbard, best, lb. 2

Tomatoes, Mexico, condition generally good; best, 3.25@3.50 lug bx.
ity and condition poor, 1.75@1.85.
Turnips, doz. 25

FRUITS

These are the actual prices obtained February 25 by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Apples: Bellefleurs, fy. best, medium size 2.00@2.25; loose, 5@6 lb. Yellow Newtons, fy. medium size, 3.00@3.25; loose 6@6½ lb. Oak Glen, Rome Beauties, large 3.00@3.50; Yucaipa, Delicious, fy. large size 3.00@3.50; medium and small size, 2.50; King Davids, small, 2.25@2.50; Winesaps, 3.00.

Pears: Winter Nellis, lb., 5@6.

CITRUS

Lemons: Fy. packed, 4.00@4.25; local pack, 3.00@4.00; loose, some tree ripe, 2.00.

Oranges: Navels, medium and large size, fy., 3.50@4.50; local packed, 2.50@3.25; loose, 3.00@3.50; Tangerines, 5@6 lb.

Grapefruit: Local fy., 2.50@2.75 bx.; Imperial Valley, 3.00@3.25; Tulare County, 2.25@2.50.

HONEY

No demand. Practically no movement. No sales reported. Probably 10 to 15 cars still in the state. Beeswax: Few sales, cash to producer on farm 38 lb.

BEANS

The general tone continues slow and weak with declines in all sections. Sacked recleaned Limas declined 50c to 7.00@7.50 per hundred weight to growers in the Los Angeles section, declining also in larger consuming markets to 9.75@10.50 with tops of 11.25@11.50 in Boston, New Orleans and several smaller cities. California sacked Small Whites declined to 8.60@10.00 in Eastern market moving very slow at that. Eastern pea beans moved very slowly at 6.50@8.00 in nearby distributing centers. Shipments were much lighter. The government has placed order for 350 cars of California beans.

GRAIN

Prices on local grain exchange.
Corn, Yellow, 2.65; White 2.60
Wheat 39.50
Milo 2.32
Egyptian corn 2.60
Barley .....1.81¼@1.82½
Egyptian corn 2.60
Feterita 2.45

HAY

Quotations by Nichols - Loomis Company. Following are prices to growers, f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices:

Tame Oat .....20.00@25.00
Barley .....18.00@23.00
Alfalfa .....16.00@20.00

The Alfalfa Growers of California, Inc., 525 Central Bldg., Los Angeles, furnishes the following quotations on alfalfa hay. Below are its selling prices to carload purchasers f. o. b. cars Los Angeles:

Market active, buyers numerous, and offerings light.
Choice dairy hay .....27.00@28.00
No. 1 dairy .....25.00@26.00
Choice Alfalfa .....24.00@25.00
Standard dairy .....21.00@22.00
Standard Alfalfa .....20.00@21.00

San Francisco Markets

San Francisco, Feb. 25, 1919.

BUTTER

Figs—Bulk basis: White Adriatic, extra fy., 17½ fy., 15¾; ch., 14; Calimyrna, extra fy., 25; fy., 23½; pkgs. ch. to fy., 12 10s, 1.75@1.80; 24 8s, 2.90@2.95; 50 6s, 3.40@4.40; 70 4s, 4.40@4.50.

Pears—Bulk basis: Fy., 19½; extra ch., 17; ch., 15½; standard, 12@14.

Apples—Lb.: Extra ch., to the evaporator, 13½ jobbing price, 14½.

Apricots—Standards, 9½; ch., 13; extra ch., 14½; fy., 16; extra, 17½; Moorparks, 19; slabs, 11.

BEANS

San Francisco and common rate points: Practically no demand or movement. Quality and condition wide range, prices lower, warehouse cash to growers, few early sales. Choice recleaned sacked per 100 pounds free from rain damage, Limas 7.50@8.00; Red Kidneys, 8.50@10.00; Small Whites 6.50@7.75; Large Whites, 5.00@6.25; Bayos, 6.00@6.50; Cranberrys, 5.00@5.50; Red Mexicans, 5.00@5.75; Pinks, 4.50@5.50; Blackeyes, 3.50@4.00; Teparies 2.00@4.00. Imports: Oriental beans December, 16,749 sacks: January none, February to date 34,948 sacks.

HONEY

Supplies liberal. Practically no demand or movement. Buyers holding off. Cash to producer at country loading points, Water White, 18@19; Sage White, 18; Light Amber, 17; Dark Amber, 14@15 lb., Beeswax, 36@38.

RICE

1918 crop, per 100 lbs: Paddy rice, Nos. 1 and 2, 4.32; 3d and 4th grades, 4.16; clean, fy. Japan, 7½ per lb; choice Japan, 7¾ per lb; screenings, 5¾ per lb; brewers, 5¼ per lb; rice polish, 50.00 per ton, car lots; rice bran, 30.00 per ton, car lots; early prolific, 4.47. All other grades are to be sold on proportional basic value and proper differentials are to be added for the cost of double pockets.

SEEDS

Flax .....8@8½
Millet .....5@5½
Rape .....2½@5

HAY

Fancy Wheat Hay (light 5-wire bale) .....24.00@26.00
No. 1 Wheat or Wheat and Oat hay .....22.00@24.00
No. 2 Wheat or Wheat and Oat hay .....16.00@20.00
Choice Tame Oat Hay .....21.00@23.50
Other Tame Oat hay .....16.00@19.00
Wild Oat Hay .....16.00@18.00
Barley Hay .....16.00@18.00
Alfalfa .....16.00@19.00
Stock hay (in order) .....14.00@17.00
No. 1 Barley straw, bale .....50@80
Damaged hay (all kinds), according to condition.

GRAIN

Barley—Feed, 1.97½@2.00 per cental; shipping, nominal at 2.00@2.05.

Oats—Red feed, 2.10@2.15 per cental; seed do, 2.60@2.75, with recleaned at 3.00@3.10.

Corn—California yellow, 2.75@2.85 per cental; Egyptian, 2.90@3.25 for dry and 2.50@2.75 for rain damaged; Milo maize, 2.70@2.90 for dry and 2.50@2.60 for rain damaged.

Wheat—Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Ba and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Cent
No. 1	2.20	$3.62 2
No. 2	2.17	3.61 2
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1
No. 2	2.15	3.58½
No. 3	2.11	3.51 2
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.09	3.48½

For sacked grain add nine cents p bushel of 60 pounds to above price. D duction of three-fourths of a pound made for weight of standard grain bag Wheat grading under No. 3 and mixed c smutty wheat will be purchased accord ing to merit.

Citrus Fruit Market

Los Angeles, Cal., February 26, 1919

Trade is reassured as to Californ quality and prices have advanced ar general market condition is steadi strengthening. Regular sized fancy stu is readily commanding between $5.00 ar $6.00. Tangerines, bloods and Navele cias are all commanding exception prices. Reports from Florida show h stock to be commanding from 3.75-4. f. o. b. shipping points. Florida shipmen are also increasing at this momen this moment, though this can be but f a short time.

Lemons are not in as high a favor though this can be but for a short tim generally good.

Shipments

Shipments of citrus fruits to date sin November 1, 1918: Southern Californi oranges 7130 cars, lemons 2171, total 930 to same date last season, oranges 41 lemons 2047, total 61.97. Central Califo nia this season, oranges 2943, lemons 3 total 3279; last season to same date, o anges 1892, lemons 106, total 1998. Nort ern California, oranges 244, lemons 2; la year same date, 202.

AT THE AUCTIONS

February 20

Philadelphia: 3 oranges, 1 lem. Na 5.25-6.00, lem. 3.60-4.15.

Pittsburg: 1 orange, 1 lem. Nav. 4. 4.80, lem. 2.10-3.50.

Boston: 4 oranges, 2 lem. Nav. 4. 5.65, Navelencias 5.70, bloods 5.00, le 3.20-4.00.

MARKET NOTES

The increased production of hogs du ing 1918 has been reflected at market ce ters during the past several months an augmented volume of receipts at pra tically all points. Figures have be compiled by the bureau of markets sho ing hog receipts at 15 markets during O tober, November and December, 1918, a January, 1919, with comparative figur for the corresponding period a year ag The receipts for the four months peri at these markets: Buffalo, Chicago, Ci cinnati, Cleveland, East St. Louis, In anapolis, Kansas City, Louisville, M waukee, Nashville, Omaha, Pittsburg St. Joseph, St. Paul and Sioux City, t taled 15,404,855, compared with 11,640,0 a year ago, an increase of 32 per cent t past four months. The numerical i crease was almost 4,000,000 head, or average of practically 1,000,000 a mont The Chicago market alone showed an i crease of more than 1,000,000 head du ing the above period, a gain of 39 p cent, but there were greater relati gains in marketing at some of the oth points. Of the markets mentioned, t following show increases of more than per cent during the four months perio Kansas City, 76 per cent; St. Joseph, per cent; Milwaukee, 57 per cent; Omah 52 per cent; Chicago, 39 per cent; E St. Louis, 37 per cent; Nashville, 33 p cent, and Cincinnati, 31 per cent. Pitt burgh alone showed a decrease, the lo at that market being about 16,000 head.

As to cheese there is a continued firm ing of the market. Scarcity of Californ cheese because of late increased co sumption and demand is reported. Or gon Young Americas sold at 36½ cer but the demand is reported as limited.

According to R. G. Risser of the bure

crop estimates the present outlook is the largest acreage of cantaloupes er grown in the San Joaquin Valley. ntracts are not all signed, and planting il not start until next month, but con- nsus of opinion is that 7000 acres will put in. The planted acreage may ex- d this figure, but is subject to later duction by abandonment. The Turlock d Ripon districts will show a marked crease. There will be new districts in anislaus, San Joaquin and Kern Coun- s. In common with other Western dis- cts, growers and shippers have been mulated by the prices of last season. Texas onions have had unfavorable ather, too cool, and thrips are show- g up. Slow growth account of weather. Florida potato acreage estimated at 610 acres against 32,730 acres in 1918. A car of Western box apples recently ld at the highest price ever recorded in iladelphia. Delicious, choice sizes, ought up to $5.15, and averaged $4.85 box. Winesaps, choice, brought up to .85 and averaged $4.28 per box. The ult was of medium size and the car ossed over $3400.

Commission men and others who have en connected with the stock yards at icago for many years, state that never fore to their recollection have the stock rds, as a whole, been in such clean con- tion for this time of the year, as they e at the present time. On account of e many complaints that were coming the bureau of markets late last fall d early this winter, one of the bureau's sistant supervisors has given most of s time to this work, and favorable prog- ss has been made. With the labor situ- ion somewhat relieved, more men have en hired by the stock yards company, d every available wagon or cart has en pressed into service, and the work s been so systematized as to produce e best possible results. The most ur-

ent needs have received first attention, ut every complaint has been investigat- d and conditions corrected where need- d; favorable weather, which prevailed ractically throughout January, was also helpful factor in bringing about the sat- sfactory results that have been obtained nd in point of total number of carloads f manure and refuse hauled from the ards, the month was a record breaker ith 335 carloads.

Wood for fuel should be sold by weight stead of by cord measure, for the heat- g value depends not upon the bulk of he wood but upon its weight, say forest- rs of the United States department of griculture in Bulletin 753, recently pub- shed. A pound of dry wood of one spe- ies has about as much heating value as pound of any other species, but two ords may vary 100 per cent in their alue for heating.

All of the special regulations governing ealers in eggs and cold storage ware- ousemen have now been lifted by the nited States food administration.

Latest reports from the tomato section n Mexico indicate that the crop will be onsiderably shorter than was first ex- ected, due mostly to weather conditions. Estimates at the present time indicate hat there will be about 125 cars from he Presidio or southern district of Sina- oa and about 500 cars from the Mochis istrict. This total is about 250 cars less han first estimates. The market con- inues strong and the demand is exceed- ng the supply at the present time. Ship- ents during the past week amount to bout 15 cars. The height of the season s not expected until April 1.—Pacific oast Packer.

FIRST CARE OF BABY CHICKS

The first requirement of young hicks is warmth, a temperature com- ortable for them. Chicks hatch in a emperature of 102 degrees to 105 de- grees Fahrenheit. When brooded by ens they remain under the mothers nearly all the time for two or three days. Chicks shipped in small boxes are kept warm by the heat of their odies so long as the boxes are not ex- posed to near freezing temperatures, ut this natural heat is not sufficient when they are given more liberty.

Have Brooder Ready

Buyers of chicks should have a brooder such as is required for the number of chicks bought ready, warm- ed and regulated when the chicks ar- rive.

If, for any reason, the brooder is not ready, take the chicks from the ship- ping box in a warm room; feed, and return to the box; repeat at intervals of three hours until the brooder is ready.

For the first few days give very close attention to regulating the brooder for the comfort of the chicks. This is the most troublesome stage in the operation of a brooder, and the most critical period in the life of the chick.

Emergency Brooder

Delay in delivery of a brooder some- times puts a novice in a quandary as to what to do with chicks. A brooder for temporary use may be made as follows:

Take a box, without cover, about 18 to 24 inches square and 10 inches high. In one side, next the bottom, cut an opening three inches high by ten inches long for the chicks to pass through. Protect this opening with a strip of cloth, tacked at the upper edge, having perpendicular slits from the lower edge to within half an inch of the top to give the chicks passage.

This box, covered on top with a piece of old blanket or quilt, may be used without heat when the outside temperature is 70 degrees Fahrenheit or over. For lower temperature a jug or a large bottle of hot water should be placed in the box and refilled as often as necessary to keep the chicks comfortable.

Feed Little and Often

Young chicks should not be fed for from 24 to 36 hours after hatching, and will not suffer if given no feed until the third day. The yolk of the egg, which is absorbed by the chick, furnishes all the nourishment required during this time. It is this provision of nature for the first sustenance of the chick that makes it possible to ship newly hatched chicks consider- able distances.

At the start it is advisable to feed five times a day, dividing the day into equal periods, and alternating a mash or soft feed, such as johnnycake, with a hard grain or scratch feed.

Scratch mixture: Cracked corn, 5 pounds; cracked wheat, 3 pounds; pin- head oatmeal, hulled or rolled oats, 2 pounds. The mixture makes an ideal ration. In the absence of corn, crack- ed kaffir corn, rolled or hulled barley may be substituted. Feed morning, noon, and night, scattered in chaff litter.

Johnnycake: Corn meal, 5 pounds; eggs (infertile), 6; baking soda, 1 tablespoon. Mix with milk to make a stiff batter. Bake well. Or a mixture of dried bread crumbs with hard boil- ed infertile eggs making about one- quarter of the mixture of infertile eggs. Rolled oats may be used in place of the bread crumbs. Feed in middle of forenoon and afternoon for the first ten days or two weeks.

When infertile eggs are not avail- able use double the quantity of baking soda, and add one-half pound of sifted beef scrap. Infertile eggs are those which have been tested out from sit- tings or from an incubator.

Green Feed

Any tender green stuff may be fed to baby chicks. When a regular sup- ply in quantity is needed, it is usually most convenient to use sprouted oats.

Water

Little chicks should be supplied con- stantly with fresh water, in either shallow pans or small drinking foun- tains.

Much frost damaged fruit was saved by immediate use in by-products man- ufacture.

SIMPLE RATION THAT DOUBLES EGG PRODUCTION

That laying hens will increase their production if fed a properly propor- tioned ration has been demonstrated in Missouri this winter. And the ra- tion costs no more than some of the carelessly compounded rations many farm flocks receive. Here is the ra- tion expressed in quantities sufficient to feed 100 hens one day:

Scratch feed: Ten pounds shelled corn or kaffir, and five pounds thresh- ed oats or barley. Feed in deep litter morning and evening.

Dry mash: Three pounds bran or three pounds cornmeal, three pounds shorts or three pounds ground oats, and one and a half pounds beefscrap or one pound tankage. Three gallons of milk may be substituted for the beefscrap or tankage. Keep this mash before the birds at all times.

In addition to this feed supply green feed in some form, plenty of fresh water and grit and shell.

The use of the foregoing ration has been advocated by the extension serv- ice of the University of Missouri col- lege of agriculture. Ten communities have reported results for the last thir- ty days which shows a percentage in- crease of 173. This means that all communities reporting are receiving a double return in number of eggs laid and one community reports that the yield has been increased sevenfold. This is conclusive evidence that the ration is practical, and that a laying hen, well fed, will respond to good feed.

REVISION OF POTATO GRADES

The following information on the re- vision of United States potato grades has been received from Washington and is intended for general distribu- tion among potato growers and the trade. The potato grades recommend- ed by the department of agriculture and the United States food adminis- tration have been changed slightly since September 10, 1917. The revis- ed grade specifications are stated be low:

United States Grade No. 1

This grade shall consist of sound potatoes of similar varietal character- istics, which are practically free (a) from dirt or other foreign matter, frost injury, sunburn, second growth, growth cracks, cuts, scab, blight, soft rot, dry rot and damage caused by dis- ease, insects or mechanical or other means.

The diameter (b) of potatoes of the round varieties shall be not less than one and seven-eighths inches, and of potatoes of the long varieties one and three-fourths inches.

In order to allow for variations in- cident to commercial grading and han- dling, five per centum by weight of any lot may be under the prescribed size, and in addition, six per centum by weight of any such lot may be be- low the remaining requirements of this grade, but not more than one- third of such six per centum, that is to say not more than two per centum by weight of the entire lot, may have the flesh injured by soft rot (d).

United States Grade No. 2

This grade shall consist of potatoes of similar varietal characteristics, which are practically free from frost injury and soft rot and which are free from serious damage (c) caused by sunburn, cuts, scab, blight, dry rot, or other diseases, insects, or mechanical or other means.

The diameter (b) of potatoes in this grade shall not be less than one and one half inches.

In order to allow for variations in- cident to commercial grading and handling five per centum by weight of any lot may be under the prescribed size, and in addition six per centum by weight of any such lot may be be- low the remaining requirements of this grade; but not more than one- third of such six per centum, that is to say not more than two per centum by weight of the entire lot, may have the flesh injured by a soft rot (d).

Explanation of Grade Requirements

(a) "Practically free" means that the appearance shall not be injured to an extent readily apparent upon casual examination of the lot, and that any damage from the causes mention- ed can be removed by the ordinary processes of paring without appreci- able increase in waste over that which would occur if the potato were per- fect. Loss of the outer skin (epider- mis) only shall not be considered as an injury to the appearance.

(b) "Diameter" means the greatest dimension at right angles to the lon- gitudinal axis.

(c) "Free from serious damage" means that any damage from the causes mentioned can be removed by the ordinary processes of paring without increase in waste of more than ten per centum by weight over that which would occur if the potato were perfect.

(d) "Soft rot" means a soft, mushy condition of the tissues, from what- ever cause.

PRUNE BY-PRODUCTS TO MAKE MONEY

Prune marmalade, or a cross be- tween marmalade and jam is soon to be put on the market by the California Prune and Apricot Growers. The as- sociation is experimenting with other by-products, such as a "mince meat" made of apricots and prunes. A dry pack of prunes, French process, is also to be put on the market. These by- products will offer an outlet to the prunes which are not perfect in ap- pearance, of profitable size, etc.

FLORIDA GROWERS FIGHTING REFRIGERATION RATES

Florida citrus fruit growers through their marketing exchange are making a determined fight on the proposed in- crease in refrigeration charges. The increase has been put off until the growers can have a chance to state their case.

ORANGE EXPORTS LAST YEAR

Orange exports for the year ending June 30, 1918, amounted to 1,240,477 boxes. This was less than exports of either 1916-17 or 1915-16. Imports for the year 1917-18 amounted to 62,- 906 boxes.

WEATHER CONDITIONS

Make Your Car Help

America is asking for a Victory Harvest this year.

Every country's short of everything. You never had such an eage market. Every additional bushel you can make your fields produc means just that much more in the bank for you.

Make your car help. Think of the time, energy and good, hard cash will save for you! Think of the speed it will put into those trips to town

Its dependable service means a lot to you.

And there's no such thing unless you give it good tires to travel on

There's a United States Sales and Service Depot dealer in the neares town. He will gladly point out the United States Tires that will mee your requirements to perfection.

For the line of United States Tires includes tires to meet an possible need.

There are five different types for passenger cars as well as both pneu matic and solid tires for trucks.

They're all good tires—the best our seventy-six years in the rubbe business have taught us to make.

Once you discover what they mean to your car—their wonderful de pendability, their real goodness—you'll stick to United States Tires jus as tens of thousands of other farmers are doing right now.

Try it and see. Ask our Sales and Service Depot to help you.

Cushman Engines
For Pumping

Why purchase an engine for pumping only. CUSHMAN engines run smoothly, steadily, almost noiselessly. They use gasoline or distillate, with guaranteed economy. High speed, with throttle governor and perfect balance, gives smooth, continuous flow of power and insures uniform speed, so that the pump or machines gives out its fullest capacity.

Built Light ——— Built Right

So that explains why they are more durable than the common types weighing four or five times as much. There are no violent, irregular explosions nor the ever-changing speeds of the heavy hit-and-miss types.

Only All-Purpose Farm Engines

When the pumping is over use your engine for other work. Being light, compact and with wide range of speed, it is easily and quickly adapted to any work. All sizes furnished with friction clutch pulley, Schebler carburetor, throttling governor, forced water circulation, battery or magneto ignition.

The Cushman Satisfies Every User----Satisfy Yourself

SILO FILLERS - FEED CUTTERS

All kinds of Feed Cutters, hand or power. Silo Cutters and Blowers a specialty. Write us your needs and get catalogue by return mail. Call and see us when in the city. Buy the genuine Petaluma Chicken Cutter of any dealer or direct from us. ARNOTT & COMPANY, Inc. 112-18 S. Los Angeles St., Los Angeles

ENGINES & PUMPS

ALPHA ENGINES
1¾ to 18 H.P.

Here is a pumping engine so well designed and so accurately machined of sound materials through and through that there can be absolutely no question about its reliability and superior efficiency. Comparison will prove its superiority.

There's nothing "cheap-john" about Alpha construction. It's dependable machinery—built for continual service season after season at the lowest cost for fuel and upkeep.

The Alpha is the easiest starting engine made and the most economical form of mechanical power. Investigate it. Write for new catalog, prices and terms.

VIKING ROTARY PUMPS
10 to 1100 gal. per min.

Viking Pumps require less power—a smaller engine—for a given quantity of water than other types. A positive-acting, slow speed, single stage pump that operates at highest efficiency under any head up to 200 feet. Details upon request.

Growing Long Staple Cotton

By M. E. Bemis

IT HAS been my privilege to interview recently a number of growers of what is now known as American Egyptian Long Staple cotton, who have produced more than a bale to the acre. As the average production is just about a half bale, the experiences of these growers who have produced more than twice the average are of no little importance and interest. The growing of Long Staple differs from almost any other crop in that no general rules can be applied. The most experienced growers will make such remarks as this in regard to the growing of the crop: "These methods have proved successful for my soil and conditions but may not do at all for someone else."

Type of soil and moisture conditions are prominent factors in determining successful methods. There are some types of soil where the growing of cotton would not be advisable. It is questionable if the extremely heavy or the very light soils are adapted to the growing of American Egyptian cotton. It is now pretty generally recognized that the raw desert lands will not usually produce paying crops the first season and many growers who have land of this type will put a considerable portion of it in alfalfa or some other leguminous crop as a preparation for producing cotton on a profitable scale.

Among cotton growers the most discussed questions are those which have to do with time of planting, distance apart in rows, as well as distance apart of the rows, and last and most important of all, the amount of water which the plants should have. With the exception of the extremely heavy or the extremely light soils, I have found that growers have been successful on soils from a gravelly loam to a rather heavy loam. More than one-half of those interviewed who have produced over one bale to the acre to a bale and a half or more, so far as I have been able to learn, planted their crop on land that had previously been in alfalfa. With one exception, the very largest crops have been produced on alfalfa and Bermuda grass sod. This is an important argument in favor of the rotation of crops and it is a source of considerable gratification to me to learn in interviewing these progressive farmers that they are looking forward to the working out of a rotation.

As a general thing most cotton growers are in favor of rather deep plowing, say about eight inches. As is well known, a shallow plowing of alfalfa which cuts off every alfalfa root, followed later by a deeper plowing, results in a better seed bed and with less trouble from alfalfa sprouts and undecayed roots. One of the best yields was obtained upon an alfalfa field plowed early in the fall of 1917, quite deep. It was seeded to barley, which was pastured until about the middle of February, then plowed shallow and planted to cotton. The largest yield was 11 bales of cotton on a little less than seven acres of land. This was land which had been in alfalfa and the previous year in grain and corn. In other words, it had produced one crop of corn and one crop of grain in 1917. It was then plowed eight inches deep in December.

Without exception, the successful growers agree that it is absolutely necessary to allow the soil to absorb as much water as possible before planting and to have the top soil in a fine dust mulch condition. These results are obtained in several different ways. As just mentioned, one successful grower accomplished this by plowing his green barley stubble (this had been closely pastured until the time of plowing) very shallow, after a thorough irrigation. This left the soil in a firm, moist condition for the roots of the young plants. At the same time the top soil was loose and easily worked into a perfect dust mulch. Planting under these conditions, the seed is brought in close contact with the firm, moist soil and germination is rapid and sure. Another successful grower accomplished very nearly the same thing by plowing deep, dragging, irrigating, disking and then rolling, following with a disk harrow set so as to cut very shallow. Another method which has been successful and is practiced by the well known grower E. W. Hudson, under whose direction the American Long Staple cotton was developed at the Sacaton, Arizona, experiment station, is after plowing and harrowing, to run a lister the same distance that the rows are to be planted apart, throwing the earth up into ridges. Water is then run into the furrows, preferably in a small stream so that the soil absorbs every drop of moisture which it will hold. Some growers are able to so adjust the head of water as to make the flow constant for a period of 48 hours. Then when the soil condition will permit these ridges are dragged down level, or very nearly so. By this method the desired condition of the seed bed is obtained—that is a light dust mulch on the surface and a firm moist soil underneath.

Now, as to the time of planting, older cotton growers as a rule prefer to plant early in March, but the fact that some of the largest yields have been obtained where the cotton is not planted until well into April would seem to indicate that the question of time to plant is not of so much moment as a thorough preparation of the seed bed and the saturation of the soil with moisture. Most of the cotton is planted in rows, three feet, six inches to three feet, eight inches. The usual type of two-row planter is not readily adjustable to other widths; however, I find that there are some very successful growers who have planted as far apart as four feet and have advocated the wide planting. This is particularly true upon land which has previously been in alfalfa and therefore capable of producing a large, strong plant and forcing the growth rapidly.

The usual amount of delinted seed planted is 25 to 30 pounds per acre, and the depth to plant varies from one inch to three inches, though the majority of growers prefer to plant not over two inches and usually under two. As to the time of planting, the temperature of the soil should be considered rather than the calendar, for unless the soil is warm enough to germinate the seed the growth will be slow and the results are apt to be a poor stand. Almost all growers begin cultivating their soil after planting; some harrow the field with a light drag harrow before the plants appear; others cultivate as soon as the plants can be seen in the rows. Usually the first cultivation is "barring off" or breaking the earth near to the plants, following this with throwing the earth back towards the plants.

Most growers thin when the plants are three to four inches high; some preferring to let the plants go as long as possible, believing that this has a tendency to check the growth of vegetative branches. Most growers thin by chopping with a hoe to the desired distance apart. A few pull the plants to a stand. This seems to be a little more expensive than chopping but does not result in injury to the plants left standing, which is sometimes caused by inexperienced, careless choppers.

The distance apart that these plants should be left in the row is one of the disputed questions. It is considered that where moisture conditions are absolutely under the control of the grower and he has had sufficient experience to determine the exact time when water should be applied and has the water immediately available, the plants may be left very close together in the row, say six to eight inches apart. Under ordinary conditions, however, it is not always possible to get water at a moment's notice, and if it were, it would be impracticable to apply it over a large acreage. Therefore, it becomes a question whether the wider spacing which permits of a wider range of moisture conditions is not advisable. In this connection, as well as in the matter of time to plant, experiments conducted at the Salt River Valley experiment farm under the direction of E. J. Woods are of no little importance.

The soil on this farm is rather heavy, although it would not be classed as adobe, but somewhat difficult to work nevertheless. Plantings were made on acre plots, the land being as nearly uniform and all other conditions as nearly equal as possible. The land was plowed in December, eight or nine inches deep, the cotton planted in rows 3½ feet apart, the plants being thinned 8 to 12 inches apart. From the plantings of March 5th, 1,806 pounds were harvested; from that of March 15th, 1,548 pounds of seed cotton was harvested; from that of April 1st, 1,824 pounds; from that of May 5th, 1,463 pounds; from that of May 15th, 988 pounds. The experiment to determine best results from narrow or close spacings resulted as follows: This was land under similar conditions to that of the experiment noted above and was planted March 15th to 20th.

(Continued on Page 345)

Spacing Cotton Plants

The hat is thrown in the foreground of the illustration to show spacing in the row advocated by many growers.

Where the Ginning Is Done

In the Salt River Valley of Arizona long staple, or to use the local name, Pima, cotton is almost exclusively grown. These gins handle the long staple varieties only.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

California can hardly class itself as one of the great cotton states. It has, however, the makin's. The crops already produced have been sufficient to show the Southwest to be a great cotton producer from the standpoint of quality, and we believ a few years' time will establish the state's reputation as to total output. The cover illustration is from a photo taken with the Cultivator camera in the Imperial Valley. This is of the upland, or short staple, or sometimes called Durango cotton, but we believe California's reputation will be made by the high quality of her long staple cotton, of which perhaps the finest grade is usually called Pima, a type developed in Arizona. It is found to do exceptionally well in the San Joaquin Valley.

OLEOMARGARINE

The California Dairy Association recently held a series of mass meetings and is making an effort to organize a more efficient state association. The specific fight now on hand is to discourage the extension of the gospel of margarine. This Chicago made "dairy" butter seems to be winning with even state and federa' officials. It is to be hoped that the dairymen can at least prevent the officials from making state purchases of this Eastern manufactured product. There is no reason why clean, wholesome California produced butter may not be supplied to our state institutions.

LOTS OF BUZZING

From all the racket the beekeepers must be swarming. There are some four bills before the state legislature, and some beekeepers want them, or a portion of them at least, made into laws. Other beekeepers are doing their best to secure their defeat. They say that the present laws are sufficient if enforced, and the expense of a new commission is entirely uncalled for. The honey producing interests of the state are becoming a great factor in its prosperity, and the beekeepers should be considerate enough of the state's welfare and their own to get their heads together and make more honey and less noise.

HAPPY ECONOMY

In urging all the people to continue the habit of thrift and economy which was formed during the few months of strenuous preparation for war a recent publication urged that we make thrift a happy national habit. We think the word "happy" was exceptionally well chosen. We often hear: "We have economized until we are heartily tired and sick of the word." Too often economy and stinginess are considered synonymous. Quite the reverse. Economy is simply thrifty or careful administration, management without loss or waste, or, to use a more homely expression, making a little go a long way, or, again, the choosing of those things which will give the greatest happiness and denying those of lesser importance, or getting what best suits your needs without regard to what somebody else has. Hence, the formation of a happy habit should not only be desired but easy of accomplishment.

GIVE TREES WATER

The orchardist who is sometimes a bit careless in the matter of fall irrigation of deciduous trees—especially if that sometime happened to be last fall—should have a care at this moment in giving the best spring attention to his orchard. After removing all the crop in midsummer it is easy to consider that the needs of the tree for that particular season have been met and no further irrigation or care is given. This results in the production of buds of such low vitality that the season's crop is seriously injured, and sometimes the life of the tree is threatened. This may be overcome to a degree at least by irrigation and fertilization with a quick acting commercial fertilizer.

The southern end of the state at least has been somewhat shy of rainfall and in those districts especially should this spring irrigation be attended to.

In the matter of using nitrate of soda the Ohio experiment station has reported that apple trees treated with nitrate of soda just before the blossoming period give blooms and young fruit more resistant to frosts and also assist in holding the young apples on the trees. The same station recommends midsummer application of nitrate to encourage better fall development of the buds of the following year's crop.

CHAMBER OF AGRICULTURE

A large number of Middle West farmers recently met at Omaha in what they called a Trans-Mississippi Readjustment Congress. By "Trans Mississippi" we take it they mean—in this case—on this side of the Mississippi.

One of their strongest recommendations urged the formation of an international chamber of agriculture to look after the best interests of the farmers of the country in the same way in which the international chamber of commerce looks after manufacturing and commercial interests.

There have been efforts during the past year to organize a great central association, or rather associations, for there have been two quite ambitious plans formulated, each along its own line and with some little antagonism. Besides, the Grange has established in Washington this year a gathering place for all concerned with agricultural interests of this country. None of these has seemed strong enough to pull all classes interested in agriculture into one body.

The present movement is endorsed and supported by Secretary Houston, Governor McKelvie of Nebraska, Lieutenant Governor Huffman of Kansas and other believers in a better and bigger agriculture. Governor McKelvie says.

"The idea of forming such a chamber has been discussed quite a little of late and will undoubtedly receive further impetus as a result of this endorsement. It arises from the feeling that there is need of a national organization which will furnish a point for the centralization of the ideas of the country's great agricultural interests and a convenient means of their expression."

INCOME TAX RETURNS

Every reader of the Cultivator whose income during 1918 aggregated $1000 if unmarried, or $2000 if married, should keep the date of March 15 in mind, for on or before that time returns must be made to the officers of the department of the interior as to items of that income. If income in excess of the figures given has been received payment must be made of at least one-fourth of the tax due to the government. This tax is compounded at the rate of six per cent on all income in excess of $1000 or $2000, that is, unless the income is over $4000, when 12 per cent is the rate.

There are many exceptions and rules and regulations which make it almost necessary to employ an expert to direct us through the mazes of these reports, but the farmer who has a clear record of his business and a clear idea of the depreciation and other items which he is entitled to take advantage of can soon make out his report.

He will find little opportunity to secure advice or assistance at any of the central offices of the department. There are literally hundreds jamming in one of these rooms and the halls approaching them, and this will continue until after the 15th. Officers of the department are, however, to be found in county seats and are sent out to other centers throughout the counties to aid in making out the reports.

We are assured by the collectors that if report is made out as completely as possible and filed, after making oath as to its correctness, if accompanied by check, any addition or correction may be made later when the rush is ended.

RURAL CREDIT

In his address of welcome to the American Bankers Association Assistant Secretary of Agriculture Clarence Ousley said:

"The only hope of a reinforced and abundant agriculture is a profitable agriculture which young men will seek as they seek other vocations that promise substantial reward, and, as the day of cheap land has passed the prime necessity for multiplying farm home ownership is financial accommodation and sound business practice for worthy young men in order that they may acquire the initial capital for farm purchases.

"While our new system of farm credit is affording much relief to those who have farm property to improve and those who have some capital with which to buy, it should be understood that the great class of tenant producers are without property or capital. Their need is operating credit in order that they may produce economically, and in order that they may acquire something with which to purchase farms. As every boy is a potential man and will be a strong man or a weak man according as he is nurtured, so every tenant is a potential owner and he will become a substantial success or a derelict accordingly as opportunties are provided."

Yet the time was when the farmer who borrowed money was hardly in good form in rural society, and to have a mortgage on the farm was evidence of lack of financial soundness. But the power for good of credit has been realized and the lack of proper conditions in handling rural credit is one reason why there have been so many failures amongst farmers. The manufactures and commerce have enjoyed vastly better financial resources and have enjoyed privileges unknown to the producing class. This is not all because of the unwisdom of the bankers but is in part due to the method of some farmers. Both the farmer and the bankers are doing some thinking which may bring them closer together and result in a more satisfactory rural credit system.

Again there is cooperation. Cooperative or massed credit is building up other countries; it will also work in the United States.

GARDENITORIAL

This is the period of the year when drivers of automobiles are warning each other to use care in driving through the country for unless reasonable care is observed one may run down a pedestrian loaded with rakes and things which are sure to puncture tires. During the past two or three years a great many have learned that the hoe and rake cost less than golf sticks and give much more satisfaction. Better than all, California farmers have learned the excellence of home made garden sass. We say "learned" for unfortunately the most attractive of all farming operations has been left to Chinamen or, more recently, to the Japanese. There is no reason why war gardens may not become peace gardens and thrift and happiness both be secured.

SAVE THE SHEEP

Man's best friend is the dog. But there are dogs and dogs. Some are as destructive as a coyote. Hence senate bill 641, introduced by Senator Rush: "An Act to impose a tax on dogs for the protection of horses, cattle, sheep, swine, other live stock and domestic fowls, defining the duty of owners of dogs with reference thereto; providing penalty for the violation of this act, etc."

This bill, intended to encourage the sheep industry, is meeting strenuous opposition from hunters and sports who have more interest in their own pleasure than in the welfare of the state. Impulsive members of humane societies are also working against food production.

The untrained large dog at liberty hears the call of the wild and dozens of fine sheep are often killed as the result of a single night's depredations.

There will be public hearing on this bill at Sacramento next Monday, and friends of the state's advancement will be given opportunity to stiffen the back and knees of certain legislators. Besides letters from Cultivator readers to assemblymen and senators at Sacramento will prove helpful.

The Prettiest Back-Lot Poultry Plant in Los Angeles

By Jean A. Koethen

"PRETTY" is not a word usually applied to chicken houses. Indeed there are those so unkind as to intimate that no chicken house nor chicken yard can be otherwise than unsightly and detrimental in a residence district. And yet I found in the swell Wilshire district of Los Angeles, right on Hobart boulevard and surrounded by elegant homes, a poultry equipment so thoroughly in keeping with its surroundings that even the swellest swells must admire. As for the cock, which fashionable Los Angeles views askance because of his unseasonable vociferation, Mr. Ruess, the owner and architect of this up-to-date poultry establishment, has him "swatted" for keeps. Every night his lordship is confined in a box, the entrance to which is pushed tight against the back-yard fence. If he crows, as he probably does, at five o'clock in the morning, nobody hears him, and the Wilshirites sleep on, peacefully oblivious of the proximity of so vulgar a noise.

Chick Coop and Yard
Fig. 1. Note canvas covering, also convenient little feeders on ground.

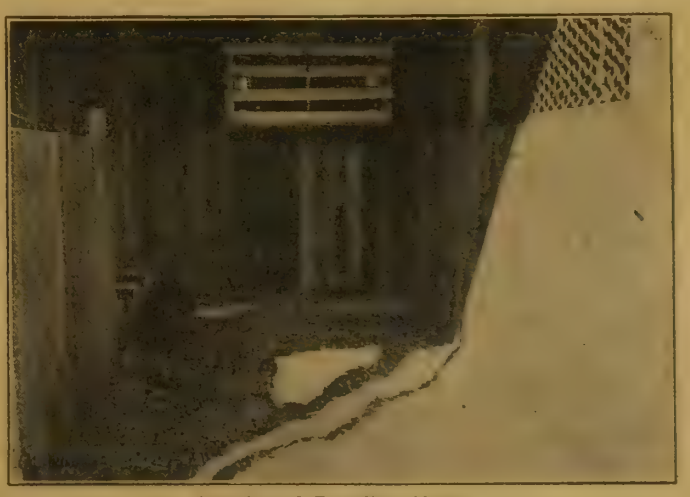
It is Mr. William R. Ruess, owner of "Perfection," the Dark Cornish cock that won sweepstakes at Sacramento and Fresno, and first at the midwinter show, graduate engineer, fancier and poultry enthusiast, who has succeeded in designing something so unique and complete in the way of brood coops and breeding houses that they recommend themselves instantly to any backlotter who is handy with tools and anxious to have his equipment beautiful as well as convenient.

Figure 1 shows something less than half of Mr. Ruess' brooding yard, which is about 25 feet square, and covered by a canvas roof sloping up to a peak in the middle exactly like a large tent, and reaching down to the rear or the coops at either side. This yard is entirely surrounded by fine wire which effectually prevents the entry of any bird, cat, dog or other "varmint." The canvas keeps out rain and fog so that the chicks have always dry ground under their feet. In front of the coop, crossing the yard in both directions and running along the wire fence, can be seen the brick walk on which fountains and feeders stand. Between the walks is soft dirt for dusting.

The coop, which occupies the center of the picture, has its duplicate on the opposite side of the yard, both facing toward the nursery coop and run, part of which can be seen in the foreground. This nursery coop looks more like a doll house than a chicken coop, with its neat, tar-paper covered gable roof, smooth floor and tightly fitting door. It is 20 inches square on the ground, one foot high to the eaves and 20 inches to the gable. The little run in front of it is about three feet long and one foot high. As soon as a brood is hatched it is put in this little run with the mother, and here it stays till the chicks can jump over the side of the run. At about three weeks of age, chicks and mother are transferred to one of the long coops, which are each 3½ feet deep, 13 feet long and four feet high in front and three feet in the back. A foot-wide strip of wire along the front provides ventilation, and the front, which is fastened in with a wooden button, is easily removed for cleaning and disinfecting. The roosts also are portable. These coops have dirt floors, for Mr. Ruess believes young chicks should be as close to Mother Earth as possible.

In Figure 2 is shown one of Mr. Ruess' breeding houses, with "Perfection" posed on a box in front of it. These houses are 11½ x 10½, six feet high in front and five feet at the rear, and, like the chick coops, are made of tongue and groove lumber. An important feature of these houses, of which there are two, is the three swinging doors which can be closed entirely or partly or opened wide. In this figure they are shown in a horizontal position. In Fgure 3 they are raised to a vertical position. Their height is controlled by two wooden props which hold them at any angle. In stormy weather the lower door, which in the cut is swung back under the windows, can be closed and the birds kept in the scratching pen. If the weather is very stormy all the upper doors may be closed and there will still be sufficient ventilation through the wire, which separates this house from the one adjoining, and through a window at the other end of the house.

Proud Aristocracy
Fig. 2. "Perfection" posed in front of breeding house.



Best of Ventilation
Fig. 3. Breeding house with doors raised.

Figure 4 shows a portion of the interior of the breeding house. At the rear of the scratching pen, which is four feet wide, hangs the broody coop or "jail" equipped with fountain and cans for feed. The floor is covered with a thick layer of alfalfa hay, in which Mr. Ruess' birds have to scratch for every bit of their grain. A four-foot partition separates the scratching pen from the laying room, where trap-nests are installed, but the ends of the roosts may be seen at the rear of the scratching pen, back of the partition. These roosts are near the ground, but not too near, and the droppings board arrangement is one of the best things on the place. Instead of a solid floor under the roosts each roost is attached to its own particular droppings board, and roost and board together may be easily and quickly carried out for cleaning and disinfecting. Speaking of disinfecting reminds me that no bug of any sort is allowed in these houses. This is one purpose of the three doors. From time to time they are tightly closed and the house fumigated with sulphur. While the sulphur is burned in the old-fashioned way, a basin of water is boiling on an oil stove, and the combination of smoke and steam is death to the most incorrigible microbe.

The chick yard and breeding yards occupy a strip about 25 feet wide, reaching across the rear of the lot. Still back of this strip, however, is another yard in which a dozen R. I. Red hens, the mothers for Mr. Ruess' high-bred Cornish, are housed. These hens are of no particular breeding, yet in October they laid 116 eggs and in November 124 eggs, while in January the eight which had not yet gone broody laid 144 eggs, and the first 12 days of February nine of them had laid 82 eggs. In this Red house, which is an old barn made over, ammunition boxes are used for nests, their advantage being that they are so easily removed for cleaning.

All the grain used for both chicks and adult stock is ground and mixed on the place. Mr. Ruess believes that the secret of chick feeding is to give them all they will eat, whenever they will eat, and as great a variety as possible of the most nutritious feeds. His chick scratch feed consists of eight parts wheat, nine parts milo and

Agricultural News Notes of the Pacific Coast

Northern California

A movement has been started to build a highway from Hopland to Lakeport.

Experiments are being made in growing cotton on the red lands about Oroville.

Paul J. Davis has been engaged as farm bureau salesman of Glenn County; he has opened offices in Willows.

The annual tour of representatives of the farm bureaus of the state will start March 26 from Berkeley, finishing April 2 at Riverside.

There will be farm bureau meetings in Glenn County at Codora Center, March 10; Orland, 12; Jacinto, 14. These meetings will be held at eight p. m.

The Durham farm bureau of Butte County has presented a petition to the county supervisors for the formation of a mosquito abatement district.

The spring sale of the California Shorthorn Breeders' Association will be held at Davis, April 8; the sale of the Pacific Coast Breeders the following day.

Twenty-four cattlemen of Solano County have formed a Solano County branch of the California Cattlemen's Association. B. F. Rush was elected president.

Experiments are being made in Alameda County in grafting over wine grapes to other varieties. Especial success has been found with grafting to the so-called Zante currant.

The spring sale of the California Shorthorn Breeders is to be held at the University Farm at Davis, April 8. The sale of the Pacific Coast Hereford Breeders will be held at the same place April 9.

Here is the anti-knocker pledge which Chico Chamber of Commerce boosters have taken: "I do hereby solemnly swear and promise that from this moment on I will bury the hammer and blow a horn."

An effort will be made before the present legislature to repeal the law under which the state market director is operating and to re-enact the commission market law which he was instrumental in putting off the statutes.

A petition has been presented to the board of supervisors of Yuba County for the formation of an irrigation district which will include the property of the Yuba Land Company, California Mission Olive Growers, Dudley Ranch and Orchards Company.

Foresters in the federal service held their annual meeting at the University Farm last week. Grazing regulations received a good deal of attention. It was indicated that the stockman who does not supply sufficient winter feed for his cattle will receive people, the theory being that he is taking more than his share of the range feed, since his cattle or sheep are in poor condition in spring.

The Glenn County Live Stock and Agricultural Association held its annual meeting on February 18 at Orland, electing the following board of directors: John J. Flaherty, H. M. Kingwill, A. E. Morey, Allen T. Moore, W. G. Gurnett, Chris Myhre, W. E. Scearce, C. A. Whitsett, W. S. Guilford, George E. Nygaard, E. A. Kirk, Dr. W. H. Walker, S. W. Baugher, L. E. Brownell, W. A. Greenwood.

Central California

Modesto claims a rainfall of 7.61 inches, as against 3.5 to same date last season.

Washington's birthday, February 22, was Community day at Kerman, Fresno County.

Poultrymen along the coast are reported to be using chopped green kelp for poultry feed.

Watsonville has shipped practically her entire apple crop. Good returns have been general.

The sugar beet factory at Visalia will not operate this year. The beets will be sent over to Corcoran.

The sugar plant at Betteravia has turned out 12,700 tons of beet sugar in its seven months' run just ended.

A fat livestock auction was held at Kearney vineyards, February 28, under direction of the county farm bureau.

Livermore Valley ranchers who are finding a surplus of hay on their hands this year are planning for another season to raise grain.

Members of the farm bureau of Stanislaus County formed a wool pool and sold to the government 30,000 pounds at 67¾ cents in Boston.

A tractor demonstration will be held on the Mordecai ranch in Madera County, midway between Madera and Fresno, from April 24 to 29.

The annual meeting of the Kerman farm bureau was held at the Union high school February 14. Officers were elected for the coming year.

Growers of berries on 200 acres at Gilroy, San Juan and Betabel, in Santa Cruz County, have signed up with a factory to be established at Gilroy May 1.

The Strathmore farm bureau has elected officers for the coming year: President, R. L. Longacre; vice president, Don Kurney; secretary-treasurer, C. R. Lamb.

The Turlock plant of the Associated Raisin Company packed this season 1,210,000 pounds of Thompson Seedless raisins, 32,000 pounds of Sultanas and 30,000 pounds of Malagas.

The grand jury in San Mateo County is investigating why part of the $500 appropriated monthly by the board of supervisors for squirrel eradication by the U. S. public health service is not being recovered through liens.

The initial order for 2,000,000 wasteballs being exhausted, another 500,000 have been ordered by the rodent control division from the state prison at San Quentin. Orders for over 1,000,000 wasteballs were received last week. Commissioner Ladd of San Joaquin reports using 100,000 per day at present.

That more than 3000 acres of raisin grapes will be planted in Kern County this year is the belief of Horticultural Commissioner Norman H. Buhn. Farmers in Lerdo district will plant several hundred acres, while the Palm ranch now has planted 140 acres of grapes. Delano, Wasco and Rosedale districts will also add to their vineyard holdings.

The Stanislaus County farm bureau, in cooperation with the Stanislaus County Swine Breeders' Association, will hold an auction sale of hogs at Modesto, March 1. The farm bureau has held several such auctions at Tegner. The committee in charge of the coming Modesto auction are Elmer Lamb, Ceres, William Way and H. I. Marsh of Modesto.

Southern California

J. W. Reed of Imperial is planning to build a grapefruit packing house.

The annual Imperial County farm assembly was held in El Centro last Saturday.

Los Angeles County's quarantine against citrus fruits from Tulare has been removed.

Farm bureau centers of Imperial County are competing in a membership campaign.

The Riverside County farm bureau is planning a campaign against the ground squirrel.

Much planting of new orchards is reported from the Yucaipa section of San Bernardino County.

The annual conference tour of the farm bureaus of the state will reach Riverside County April 2.

The Covina Heights Groves Association is enlarging its packing house, adding 2000 feet floor space.

The San Antonio Fruit Exchange has just sold a carload of Pomona Valley oranges in London for $8.00 a box.

Imperial Valley shipped East 81 cars of live stock on Thursday, February 27. Two trainloads carried the stock.

Large citrus plantings are reported being made in the Valencia Heights district south of Covina in Los Angeles County.

The California Peach Growers and the Prune and Apricot Growers have been signing up members in the San Fernando Valley.

The Brawley News is calling attention of poultry raisers of the valley to the necessity of organizing in a marketing association.

The movement started by bean growers at Oxnard to form a 300,000 bag pool of Limas has spread and signers are being found in other sections of the county.

The Arlington Chamber of Commerce at its annual meeting last week elected N. S. Elder president; Robert Webber, vice-president; J. W. Wells, secretary; J. B. Smith, treasurer.

The lettuce acreage of Imperial County is estimated at 2650 acres, compared with 2500 last season and 960 the preceding season. Shipments will reach their highest point this month.

The Southern California Traction Engine and Implement Dealers Association has elected H. L. Marsh president, succeeding the late C. H. Stevens. R. M. O'Neil was reelected secretary and manager.

At the recent meeting of the farm center at San Juan Capistrano, Orange County, a committee was appointed to confer with the Santa Fe railroad to bring back the old freight rates on beans to the northern warehouses.

The new report of the state board of equalization shows a decrease in the fruit tree acreage in Los Angeles County. This is attributed to the more accurate reports now being made compared to the large-handed estimates of former years.

One of the largest gatherings of farmers in the Garden Grove section met at the farm center Monday evening to protest the raise of telephone rates. Considerable heated discussion continued for over two hours, and 90 per cent of the 200 present were in favor of removing their phones immediately upon the enforcement of the new advanced rates.

The Coast and General

Wages for farm labor have increased 53 per cent since 1916.

Condon, Oregon, expects to ship one million and a quarter pounds of wool.

One evaporating plant at Yakima, Washington, dried last season 3000 tons of cull apples.

Experiments will be conducted on the university farm at Tucson and on the Salt River Valley experiments farms at Mesa, in the growing of flax. This work will be under the direction of a representative of the United States department of agriculture.

The Arizona state fair for 1919 will be held November 3 to 8. Charles Price is secretary of the state fair commission. No fair was held in 1918 owing to the prevalence of the influenza, and a special effort will be made to make the fair of 1919 better than any other held in the state.

Honorable Andrew Kimball, Arizona representative of the land settlement division, federal railroad administration, is working on a plan for the building of seven reservoirs for the storage of water to irrigate nearly a half million acres of Arizona land, to become available for returned soldiers and sailors.

The question of whether the proposed storage dam on the Verde river in Arizona should be used to irrigate lands within the boundaries of the Salt River project which are not already supplied with water or applied to lands to the north of the project in the Paradise Valley is being submitted to secretary of the interior, Franklin K. Lane.

Professor Homer Derr, a graduate of the Kansas State Agricultural College, has been appointed supervisor of agricultural education and itinerant teacher of the Arizona college of agriculture. Captain F. R. Kenney, a graduate of the Michigan agricultural college, has been appointed an assistant professor of poultry husbandry of the Arizona agricultural extension service.

Contending that restrictions on the free sale of fruit juices will kill the fruit juice industry, now becoming fairly well established in the Northwest states, the Eugene, Oregon, chamber of commerce has protested to the congressional committee framing the 1918 tax bill against the proposed 10 per cent tax on the sale price of all fruit juices.

The annual meeting of the Arizona Cattle Growers held recently in Phoenix was an unqualified success. More than 500 delegates were in attendance. Charles P. Mullen of Skull Valley was reelected president. The Phoenix chamber of commerce gave a barbecue at which 40 quarters of beef, and two ostriches were barbecued and served to the guests. Two hundred and fifty gallons of coffee were also served. A street dance was held the last night of the convention.

Governor Campbell has inspected the highway betwen Phoenix and Yuma. This, on the maps appears as part of the Borderland route but on account of the almost impassable condition over a portion of the route in Arizona and also from Yuma to El Centro in California, there is very little travel. There is a strong sentiment in both states to make this part of the transcontinental route. Governor Campbell estimates that the cost of putting this road in good condition will be approximately $400,00

The Care of Walnut Scions

Written for California Cultivator
By J. B. Neff

AFTER walnut scions on top grafted trees have made a growth of 12 inches they should have a support to start them in the direction they should grow and to keep them from breaking in the wind or from their own weight. This can best be done by nailing strong laths one inch by two inches by eight feet long to the trees. These can be cut from good pine fencing and the nailing may be done with eight penny nails without any damage to tree or scion if care is taken when driving the nail nearest the scion that the scion is not loosened. Let all the scions that will grow remain the first year and keep them tied loosely to the laths, examining frequently to see that the strings do not cut the young growth.

Do not head back any scion growth the first summer as the shock is likely to dwarf the growth and sometimes kills the scion, neither will branches formed by such heading be well united to the main stem.

An abundance of suckers will start all over the body and stubs of the grafted tree, often before the scions put forth leaves. Leave all of these at first except those which are within a few inches of the scions and keep all the suckers shortened back so they will not interfere with the scions. After the scions are well established part of the suckers on the north and east sides of the trunk should be cut off smooth and those on the south and west headed back to two feet in length. This prevents sunburn and also keeps the roots in good condition. When the scions have made a growth of two or more feet further thinning of the suckers on the body and stubs should be done at intervals of a week or ten days until all are taken off by September first. If two or more scions have been placed in one stub it may be necessary to cut out all but one the following winter. Any necessary shortening of the growth can also be done at this time. However do not take off the lath supports until the second summer has passed.

All cuts made where branches of two or more inches in diameter have been removed should be covered with heavy metallic paint and this should be renewed once a year until the wound has closed, otherwise a dangerous decay may begin.

CENTRAL CALIFORNIA PEACHES

By Ernest Braunton

Mr. Fred Drew, superintendent of the Schuke & Co. cannery at Niles, was interviewed regarding canning peaches for that district and stated that the demand for good peaches far exceeds the supply and promises to do so for many years to come.

Regarding varieties he stated that the Lovell is the best for canning as it has a small pit easily removed and and leaving a large solid meat which holds up after being in the water. The greater part of the extra fancies come in the Lovell, and as it brings the best price it is most profitable for the grower. Fosters and Crawfords are not much in demand locally, but are used to fill in some seasons. They are, however, quite generally harvested when partially ripe, almost green, and shipped to Eastern markets. The Muir is not a favorite with canneries, but is best of all for drying, so that all in that district are advised to plant Lovell as by far the best freestone.

As to the clings, the Tuscan is by far the best. It is the earliest and is the one generally used to start the canning season with. The grades in this peach are universally higher than in the others, and as the trees yield heavily and command good prices it should be the favored clingstone in planting new orchards. The Orange Cling is a large fruit. It does not grade as high as the Tuscan, but the yield is enormous. The Phillips Cling is the favorite late peach, coming in just after the Orange Cling, and is in quite strong demand by canneries, for the percentage of extras in this variety is welcomed by them. A few other varieties reach them in but small amounts. Mr. Drew's advice is to plant more peaches, but of those sorts proven to be the best in local territory.

Glenn County has fixed dates for her county fair, September 29 to October 4.

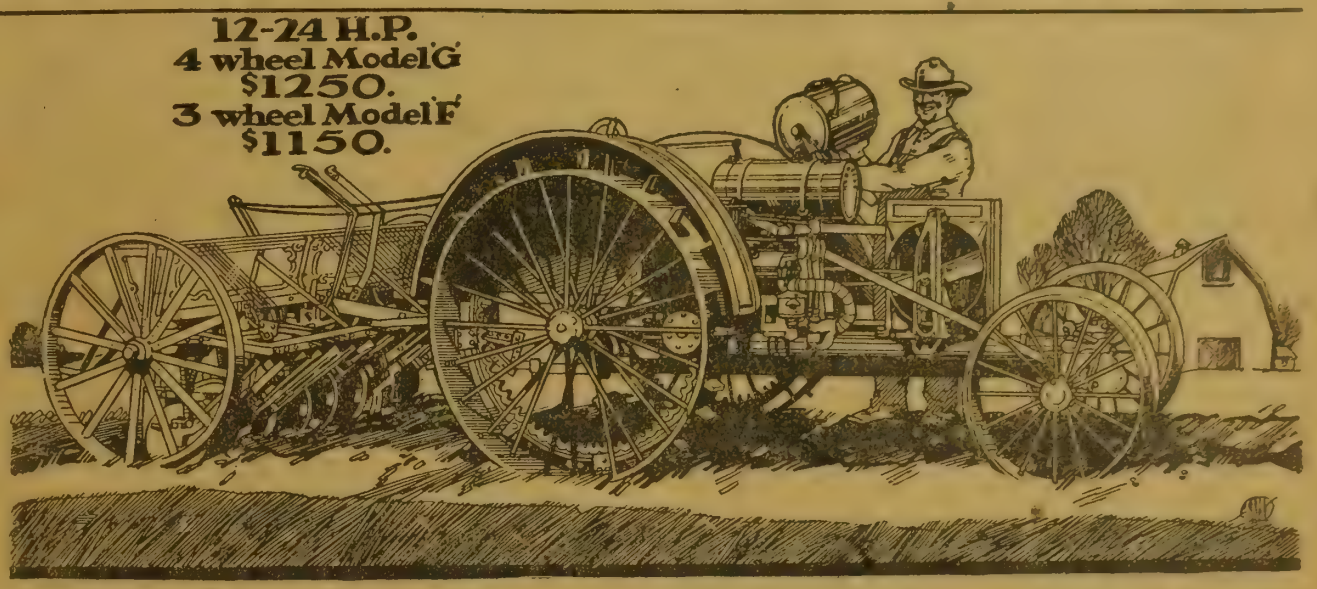
BEDROOM, WITH WINDOWS CLOSED, BECOMES HOME DRYING PLANT

Just because you have no money to invest in a commercial drier is no reason for going without one, is the opinion of a woman in Jefferson County, Florida.

The home demonstration agent who supervises the work in that county has been giving demonstrations on drying vegetables to the women of the various neighborhoods.

Going one step farther than drying around the stove, one woman thought out a practical arrangement in her own home for drying vegetables on a large scale with practically no expense.

She removed all the furniture from a small bedroom except an iron bedstead and its springs. This bedstead was placed in front of the fireplace, wherein a big fire was built. On the bedstead she arranged large trays in tiers. With the windows closed the whole room was a drying oven, and a temperature of 108 could be maintained easily. Everything from corn to figs has been dried by tnis novel arrangement.



CANNING APRICOTS

In the coastal districts of Central California the Blenheim leads both for canning and drying and is most extensively grown in the Santa Clara Valley. The Royal is always a favorite. Of 'cots shipped to this district from the San Joaquin Valley the Tilton is the leader. Moorpark is large but is better for drying than canning. One marked peculiarity of this variety is that it ripens from the pit outward, much more so than any other, being often clear green on outside while ripe and soft at pit.

EGYPT SEEKS TO MAINTAIN COTTON PREEMINENCE

The success attending growing of Egyptian cotton in Arizona is spurring on the growers in Egypt to special effort to control degeneracy of their cotton by mixing with other strains. Cotton growers in India are also having considerable success with Egyptian long staple.

Much planting of fruit trees is reported in Nevada County.

THE La Crosse is the tractor and kerosene is the fuel which practical farmers choose. Both of them furnish maximum power for the money invested.

The wonderful La Crosse motor is especially designed to handle kerosene successfully. With its six inch bore and seven inch stroke, it consumes the kerosene completely without overheating or carbon trouble, and is at the same time exceptionally economical on both fuel and oil. There is no waste with the La Crosse Tractor. It turns every ounce of kerosene into actual power.

First in the Field

It is only natural that the La Crosse should be the perfect kerosene burning tractor. Made as it is by the great La Crosse organization, it is the work of the most experienced, practical engineers in the tractor industry today. As the tractor which is designed to be the leader of the field, it has the best of mechanical construction in every detail.

The La Crosse Tractor is the ideal machine for average use. With its light weight and wide tread it can plow early in the season. It is the convenient easy-to-operate tractor for disking, harrowing, seeding, harvesting, threshing, filling silos, grading or dragging roads.

You can handle the La Crosse Tractor together with the implements single-handed. As you sit in the driver's seat every working part of the engine is within easy reach. The La Crosse Tractor turns in its own tracks within a space of less than nine feet. It is self-guiding in the furrow. When you are plowing on side hills, a special footbrake holds it snug up against the landside and prevents slipping. These are only a few of the many exclusive features which are responsible for the well-known saying, "A La Crosse Tractor means a Happy Farmer"..

You can secure a La Crosse Tractor now for $1,250. It offers you 12-24 horse power—or an average of one drawbar horsepower for every $100 invested with considerable extra power in reserve.

La Crosse Tractor Implements

La Crosse Tractor Implements are as practical and convenient as the La Crosse Tractor. They are the implements which can be handled entirely from the tractor seat. Ask your dealer to show you La Crosse Tractor Plows, both moldboard and disk, La Crosse Disk Harrows and the La Crosse Power Lift, Power Pressure Grain Drill.

See The La Crosse Demonstrated

The actual work a tractor does in the field is the only real test of its efficiency. An outdoor demonstration of the La Crosse Tractor will be held near you soon. Be sure to see it.

If you hope to have a La Crosse Tractor this season you have no time to loose. More people want La Crosse Tractors every day. The supply is limited. Write us today for your dealers name.

Long Staple Cotton in Egypt

Addressing the cotton growers of Egypt, the consulting agriculturist of the ministry of agriculture of Egypt has written an article for the Bulletin of the Imperial Institute touching upon the unique advantages offered in Egypt to cotton growers, especially with respect to production of particular kinds of cotton. But in the same article he gives warning that certain portions of the southwest of the United States are a strong competitor. From the summary of his article we quote:

"Egypt has so far as at present determined, unique advantages for the production of a special kind of cotton of high value. Attempts are being made in India and Arizona to emulate Egypt's success in this respect, and attention is drawn to the progress made in America, to be regarded as a warning of what may happen if steps be not taken to maintain the purity of the existing Egyptian commercial varieties in this country.

"The period of life of an Egyptian commercial variety is not long, owing to the fact that the characteristic qualities which constitute its value, are usually rapidly broken down by cross-fertilization in the field, and by careless mixture of seed in the ginneries.

"The origin of all Egyptian commercial varieties appears to have been a single plant in each case. These plants may be assumed to have been 'mutant' strains, the nature of which, so long as they are each inbred, is to breed true to the parent type. The theory of the commercial varieties being ever-splitting hybrids is therefore apparently untenable. The assumption of the mutational origin of Egyptian commercial varieties is supported by what has been found to occur in experimental breeding from Egyptian seed in Arizona.

"The inducement for certain cultivators to select single and remarkable plants, in order to propagate new varieties, has arisen from a desire for money-making, but this advantage is only coincident with the retention of a monoply of the seed. Impracticability of keeping this has resulted in the deterioration of the variety as soon as control was lost. The government's attempts to fix and maintain the purity of existing types are faced with the same fate when the purified seed becomes widely distributed. The necessity of cultivators asking for the cooperation of the government in prolonging the life of pure commercial types should be brought to public notice. The measures which the government would have to enforce, if control were to be exercised in this matter, are stated.

"Examples are given of the introduction of locally undesirable types of cotton into areas otherwise confined to the cultivation of one special kind; and of the injurious irregularity introduced into the seed for sowing by the fraudulent admixture of two totally different varieties of cotton in the operation of ginning. A statement is made of the success which has attended the efforts of the ministry of agriculture in the isolation of a purified type of cotton, which has yielded from six and one-half to nine and one-half kantars per feddan (620-906 pounds of ginned cotton per acre) in the last year, and of which samples have been pronounced by buying experts in Alexandria to be of excellent quality. Attention is drawn to the fact that, in the process of the dissemination of the seed descendant from the purified type, it must, under present circumstances, become impure, necessitating the incessant selection each year of a new nucleus in order to overcome the establishment of the inevitably deteriorated descendants. This difficulty would disappear if the majority of cultivators, as well as the ginners, could be brought to understand the position thoroughly, and combine in an appeal to the government to assist them."

Olive Trees

such as these are grown only on our foot-hill locations.—Note the good roots—for hardiness they have no equal.

We have a fine lot of Mission and Manzanillo trees, both on Picholine roots and grown from cuttings. We have had splendid success on all Olive plantings—a most important assurance to you.

Submit a list of your tree wants for special quotation. Do it right now.

We have also a complete assortment of Shipping Plums, Cherries, Prunes, Bartlett Pears, Fall Pears, Peaches, Almonds, Apricots, Walnuts, etc.

Our foot-hill grown trees are free from root diseases common to other localities. Our trees insure your future profits in fruit growing.

And remember—we will accept Liberty Bonds as full or part payment for trees. Write us today.

WALNUT CODLIN MOTH IDENTIFIED

It will be remembered that the walnut growers during the season of 1918 were greatly concerned over the spread of the walnut codlin moth. At that time the identity of the insect had not been finally established and a doubt existed whether the walnut codlin moth was identical with that of the apple. The fear that this insect attacking the walnuts was a different species was so acute in some quarters as to lead to strong recommendations to the state commissioner of horticulture for restriction on the movement of walnuts and walnut containers from infested sections into or through sections which had not yet showed signs of infestation. Larvae of the insect in question were sent to Dr. A. L. Quaintance, entomologist in charge, deciduous fruit insect investigations, bureau of entomology, of the U. S. department of agriculture. The state commissioner of horticulture has just received a letter from Dr. Quaintance stating that the adults have recently emerged and have been determined to be the codlin moth, Laspeyresia (Carpocapsa) pomonella, Linn.

BOTH ARE GOODYEAR TUBES

GOODYEAR'S ability to build tubes that last long and hold air unfailingly is dramatically related to the fact that Goodyear is also a successful manufacturer of balloons and dirigibles.

There is sound basis for such assertion. Both tubes and gas bags present problems of inflation.

For nine years, Goodyear has pioneered the furthering of aeronautics in this country.

In constructing these giant gas bags the problem of inflation is exceedingly complex.

For the gas of the balloon is more elusive than air; harder to hold within rubber.

But it has been conclusively established that stout, light fabric, impregnated with rubber and *built up layer-upon-layer*, forms the most practical container for this elusive gas.

Is it not quite logical, therefore, that this same *built-up* principle of construction should be successfully applied to tubes whose sole function it is to hold air?

Goodyear Heavy Tourist Tubes are built on this principle and their valve-patch is *vulcanized-in*. Built up as they are with several plies of pure gum, they are the best air containers we know of.

There are thousands of passenger-car owners who use Heavy Tourist Tubes exclusively, gladly paying the slightly added cost in the firm belief that they thus protect and get more mileage from their tires.

More Goodyear Tubes are used than any other kind.

The Goodyear Tire & Rubber Co., Akron, Ohio

With the Return of
Peace and Prosperity
Plant
Teague Quality
Citrus Trees

With the present demand for food stuffs, the return of peace and normal economic conditions there will be a growing demand for all orchard crops and a corresponding larger demand for nursery trees. Already this return is finding expression in an increased demand for Teague Quality Citrus trees, which leads us to advise intending planters to book their orders early, as the available supply of really good, bud-selected (pedigreed) trees is rather limited. For this reason we invite correspondence. Prices cheerfully furnished.

The Mulched Basin System as a Citrus Grove Method

From an Address by C. A. Jensen at Citrus Institute, San Bernardino

WHEN the surface soil has been disked loose, the basin is made simply by moving enough dirt out from under the tree top with a broad hoe to make a circular or rectangular dike around the tree. The dike should be about eight inches high and broad and firm enough to retain the water run into the basin. If the ground is quite sloping it is necessary to make two basins by each tree, one on the upper side and one on the lower side of the tree, to avoid digging out too much soil on the upper side of the basin, as the bottom of the finished basin must be approximately level. This leaves the tree standing on the dike between the two basins. If the ground is level the basin is usually made so the tree stands in the center of the basin, the soil around the tree trunk being either left undisturbed or so arranged that the bud union is not likely to be surrounded by wet soil when water is run into the basin. Otherwise gummosis may result.

Size of Basins

With trees planted 20 or 22 feet apart, and on level ground, it seems best from the standpoint of team work to have the basins meet half way between the trees in the tree row, and to extend them four or five feet on each side of the tree in the furrow row which will make the basin about eight or ten feet wide and about 18 feet long, with the tree in the center of the basin. If preferred the basin can be made circular. This arrangement leaves a strip of unbasined soil nine to eleven feet wide in the previous furrow, which can be used for team work, and this strip ought to be irrigated frequently enough to keep the tree roots in this area growing. If desired a winter cover crop can be grown in these strips.

Irrigation

The basins are irrigated from a furrow running the full length of the basined row and just outside the basins, each tree being irrigated individually. It is not good practice to irrigate many basins by overflow from one basin to another as too much water is lost in the deep subsoil and the soluble plant food from fertilizers is carried from the upper basins to the lower ones to some extent.

Mulching

As soon as practicable after the basins are formed the organic mulching material should be put in. Enough must be made to make an effective mulch over the entire basin area, as otherwise the exposed ground will become very hard and unsuitable for root growth. For a basin about 8x20 feet, the amount of mulching material necessary will be the equivalent of about one to one and a half bales of alfalfa hay or bean straw, or about 20 feet of manure. This amount applied in the fall, which seems to be the best time to install the system, will last about a year. Somewhat less material will be needed the second year, as there will be some cellulose debris left at the end of the first year.

Mulching Material to Use

In all my experiments, carried on mostly on the groves of the National Orange Company, L. V. W. Brown, and the Corona Lemon Company, to whom I am deeply indebted for cooperation, I have found alfalfa hay to be the best material of all, so far as fruit production is concerned, the second best being Lima bean straw, third best manure. The increase in orange production by using alfalfa over manure has ranged from 20 per cent to 170 per cent where individual tree records were known for several years previous to the experiments. The National Orange Company have carried out quite a number of experiments under comparable conditions with alfalfa hay, bean straw, manure, and barley; the beneficial effects of these substances on citrus trees were always in the order named. Any material composed largely of cellulose, such as barley straw, corn stalks, sawdust, etc., has been found detrimental to citrus trees, at least when used in basins. Such substances used alone produce unthrifty yellow leaf growth and small amount of fruit of poor quality. It is therefore advisable to use either alfalfa hay, bean straw, or manure. Alfalfa hay or bean straw that has been spoiled to the extent of being useless for stock feeding is apparently as good as sound material for mulching purposes, provided of course that it has not lost its fertility by too extensive decomposition.

Limitations of the System

Some soil types are not suitable for the mulched basin system. A lemon grove on heavy adobe soil near Whittier was basined and thoroughly mulched with a good quality of bean straw. In a few months the trees began to take on an unthrifty appearance and in about a year the trees looked considerably worse than those furrow irrigated and cultivated in the usual manner. Lemon groves on soil near Chula Vista composed of one to two feet of adobe overlying a lighter soil have not responded favorably enough to the mulched basin system in about one and a half years to warrant extensive use of it on that soil type.

The soil types on which the mulched basin system has given the best results have been loam or heavy loam soil in granitic areas where the soil is shallow—two to four feet. Also on the same kinds of soil on rolling topography where proper irrigation is difficult.

Advantages and Disadvantages

The mulched basin system has some important advantages and some important disadvantages, where the soil type is itself suitable for its use. As the favorable side we have the benefit of bringing into functional activity during the entire year the root system between the trees in the tree row. This root area is not generally irrigated and fertilized in the summer time in the interior citrus belt. The basin thus brings into activity an additional root feeding area during the summer at least. The advantage of the basin system when using concentrated and expensive fertilizers is obvious as the material comes into contact with the feeding root system as soon as made soluble by the water run into the basin. More uniform irrigation is assured as each tree can be given any amount of water deemed necessary, and trees at the lower end of the grove can be given as much water as those at the upper end. There is also a smaller waste of water in the deep subsoil at the upper end of the grove in porous soils.

Whether the organic matter used as mulching material, and which also acts as a fertilizer, is used more economically in basins than in the usual way of disking or plowing it under has never been determined by properly controlled experiments so far as I know. The organic mulch in the basin serves the two-fold purpose of a fertilizer and a conserver of soil moisture, and it would be very difficult to determine whether the surface organic mulch in the basin is more or less valuable, everything considered, than when plowed under. When plowed under much of it remains in the dry soil mulch, where it becomes very inefficient both as a fertilizer and as a conserver of soil moisture.

Some of the disadvantages of the mulched basin system are also obvious. In the course of time grasses and weeds of various kinds form a dense growth in the basins and these use up a great deal of moisture, perhaps as much as the tree itself. It is commercially impracticable to keep the weeds down as this necessitates considerable hand labor. In some cases where the mulching material contained little or no weed seeds, the weed problem was not serious for the first year, but sooner or later this trouble must be reckoned with. The basin system is more expensive in irrigation labor though more economical in the use of water. It does not lend itself satisfactorily to night irrigation.

As the mulched basin system produces a very dense feeding root system in the top two or three inches of soil, the organic material must be supplied in sufficient quantities to maintain a moist soil under the mulch. This naturally requires a greater expenditure for orgagnic material than would sometimes be made where the furrow system of irrigation is in use. This point can be considered either as an advantage or a disadvantage, depending on the point of view of the grower and the state of fertility of the grove.

Permanency of Mulched Basin System

I am of the opinion that in the interior citrus belt of California there is no permanent single system of citriculture, so far as cultural methods are concerned. Continuous shallow plowing or disking almost invariably produces a troublesome so-called plowsole, which interferes with both irrigation and free root penetration. In this system much of the fertilizer finds itself in the surface soil mulch where it does very little good. On the other hand it does not appear that entire cessation of surface cultivation is good either, such as is the case in the mulched basin system. In some cases after two or three years the soil surface in the basin has become hard and somewhat impervious to water, though this has probably been due to some extent to letting the basins become too dry before irrigation.

Even in some of the places where the system has produced the most marked response in foliage and fruit growth during the first year or two, the improvement has not continued, and in some cases there was actually a marked decline after the second or third year. In some of the citrus areas in the interior region where a shallow soil overlies granitic rock, or where plowsole and topography interfere with proper irrigation and fertilization, the system certainly merits consideration. In a number of cases under such conditions it has transformed non-bearing citrus trees with yellow and sparse foliage into trees loaded with fruit and filled with a dark mass of healthy thrifty foliage, all in less than a year. On some of the soil types where it has been installed there has resulted neither injury nor benefit. It would probably not be advisable to install the mulched basin system in a grove where the soil is deep and already in a favorable condition both as to mechanical condition and fertility. As the system does not produce the same results on all soil types the soil of the particular grove in question should be studied before installing the system.

To return to the furrow system from the mulched basin system it is only necessary to disk down the dikes and the surface feeding root system in the basin need not be seriously disturbed.

GRAPEFRUIT IN ISLE OF PINES

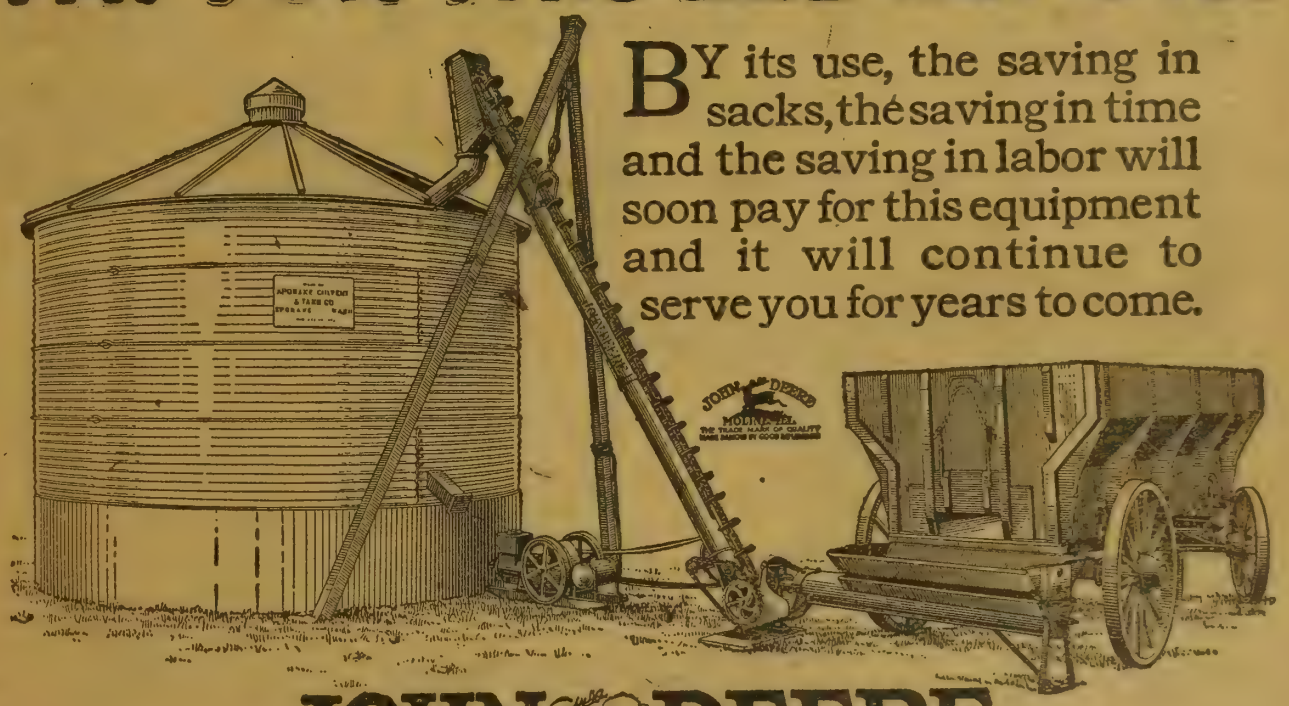
Grapefruit, at present the principal product cultivated by American fruit growers on the Isle of Pines, ripened somewhat sooner than usual and is of fine quality, but the crop, in comparison with former years, is a very unimportant one as regards quantity.

The damage to the trees by the hurricane of last September, coupled with a lack of chemical fertilizers, has resulted in a yield of fruit far below the normal. It is expected that about 20,000 cases will constitute this year's crop, whereas the normal crop runs between 50,000 and 55,000 cases.

While the quantity of grapefruit harvested this year is discouraging to the growers, it is expected that their losses will be somewhat offset by higher prices obtained in the United States for the early fruit.

REPELLENT FOR PEACH ROOT BORER

The use of "crude oil whitewash" against the peach root borer is being advocated by L. R. Cody, county horticultural commissioner of Santa Clara. In his investigations Cody has found distinct sunburn injury resulting from the use of asphaltum, and to offset this condition he has adopted the "white" oil wash, which it appears has the effect of reflecting sun rays and preventing sun scald.



The formula used by Commissioner Cody is known as the government formula No. 1 and is as follows: Fifty pounds of stone lime (in a barrel), slaked with from 10 to 15 gallons of warm water. While the lime is boiling, slowly pour in six gallons of heavy crude oil. Stir and add water to make a heavy paste. This must be used the same day as it is mixed and not used if kept over. Mr. Cody says the cost of borer work in the orchards—that is, the safeguarding work and elimination—does not exceed $1.50 per acre.

A bill to enlarge the Horticultural and Agricultural Commission of Arizona from three to five members is before the legislature. The purpose of this bill is to obtain a wider representation. The Horticultural and Agricultural Commission, when first organized, was for the benefit of the fruit growers. The rapid increase in the acreage of cotton and the necessity of rigid laws to prevent the introduction of dangerous insects has gradually widened the scope of the commission and cotton growers and fruit growers are demanding wider representation.

At the Salt River Valley experiment station at Mesa, Arizona, a ten acre orchard of fruit trees is being set out this spring. This orchard will be composed of all the new varieties of all kinds of fruit, totaling about 400 different kinds. Pecans and walnuts will be included in the orchard.

The state highway department of Arizona expects to have 600 men employed on the road work within the next 60 days.

LET THE MONEY IT SAVES PAY FOR THIS ELEVATOR.

BY its use, the saving in sacks, the saving in time and the saving in labor will soon pay for this equipment and it will continue to serve you for years to come.

JOHN DEERE

TUBULAR STEEL ELEVATOR

It handles all small grains—wheat, oats, rye, barley, shelled corn, flax, rice. It has big capacity—it elevates 15 to 20 bushels per minute—handles the biggest load in six to eight minutes time. This big capacity is secured at comparatively low elevator speed.

It serves you when marketing your grain, as well as when harvesting it—elevates from the wagon into tanks, granaries or cars—elevates from tanks or storage bins into wagons. Operated by either engine or horses, its purchase ordinarily does not result in extra expense for power. A team of horses or a 2½ H. P. engine or larger will operate it.

The hopper, of big capacity, can be folded up out of the way when the load is driven up. Lower the hopper and the elevator is ready for duty. Backing the wagon is unnecessary. Hopper is provided with an adjustable feed by which the volume of grain being elevated is accurately controlled—you can quickly adapt the elevator to the power you apply.

Built of steel almost entirely, it will not warp or decay. The elevator proper is made of ⅜ in. steel well-casing, 6½ in. in diameter. It will never wear out. Round steel flights run smoothly inside of casing. The heavy elevating chain is fastened to center of flight. Grain cannot get under chain or into sprockets—no grinding, cracking or spilling of grain.

Shafts which operate in self-aligning bearing cannot get out of line and cause heavy draft and breakage.

Portable outfit furnished for big ranches where quick transportation is required.

Because of the many years it will serve you and its extremely low maintenance cost, the John Deere is decidely the most economical elevator to purchase. It is a real solution of your grain handling problem.

Don't wait until too late to get a John Deere Elevator—see your John Deere dealer at once—get extra value by getting the best—the John Deere.

John Deere elevators are carried in stock by John Deere Houses at Portland, Spokane Seattle, Boise and San Francisco.

JOHN DEERE PLOWS Make Better Seed Beds

Pruning Blackberries

Written for California Cultivator By H. Culbertson

WHY should they be pruned? First, because they will bloom so full and set about three times as much fruit as they can properly mature. Unpruned vines or canes have a lot of fruit that is small and dries up before it ripens. Many of the berries that may be considered worth picking have hard cores. Second, well pruned they produce large fine berries that are very desirable and sell well on the market.

Blackberries have a main cane and a number of branches. Some of the side branches, if they have been well cared for, may be four to six feet long. The height of the main cane may be only three feet or it may be ten or 12. It depends much on whether they grow very scattering or in thickets. Thus the branches may begin only a few inches from the ground or as high as six feet. If in thickets, generally about half of the canes should be taken out to begin with. They may be pruned very short and get two crops, one in June and one in August. Usually there is so much other fruit on the market at the latter time that it is not desirable. The pruning should be done so as to get all the fruit in the one crop and get it large and fine.

The pruning then, in a few words, is to cut off the main cane just above the top sound branch and cut off one-half to two-thirds of the length of the side branches. This is the whole thing in one sentence. For convenience in getting the berries the old canes should be cut out. After they are cut off at the surface of the ground a long handle should be used with a hook on it.

Even the side branches need such a tool. Very often a pair of pinchers helps much in getting the brush out. In the pruning and care of the blackberry it should be borne in mind that the plant is making its last effort in producing the crop and dies after the effort. If not pruned or well cared for it begins to die before it has completed the job, and hence many of the berries dry up before maturing. Hence the importance of good pruning, that the vitality of the plant be kept up until it has performed its work.

This can be aided much by the other care and irrigation. As soon as the berries show the first reddish color they need a good irrigation every week on naturally well drained soil. Th stand a remarkable amount of irri tion and bring results in proporti Heavy manuring and mulching ma a great difference in results. In f it does not pay to grow them witho good care. With the best of care t results are almost too large to put print, providing there is good sale them.

GOOD MARKER

Here is a hint for nurserymen, for truck farmers, or any one else who has occasion to mark out ground in regularly spaced rows. These three wheels are from an old time cast-off auto, and the idea of using the wheels with the connecting gas pipe w evolved from the head of R. Teague, the San Dimas nurseryma who is holding the marker. The ma er speaks for itself and almost wor for itself excepting that it has to ha a bit of push.

QUARANTINE FOREIGN CEREA

Prohibition or restriction of mo ments of wheat, rye, barley, oats, a rice to continental United States fr Australia, Japan, India, Italy, Fran Germany, Belgium, Great Britain, I land, and Brazil is believed by t United States department of agric ture to be necessary on account of t prevalence in those countries of flag smut and take-all diseases. T former affects wheat alone, and latter wheat, rye, barley, oats, rice. A hearing to determine whet or not a quarantine is necessary, w be held at 10 o'clock, March 25, in t office of the federal horticultu board, Washington, at which perso interested in the proposed quar tine may be heard, either in person by attorney.

Both of the diseases are very structive. Flag smut affects the l blades, leaf sheaths, stems and so times the spikes of wheat. Usua every shoot is affected, the lea wither and the spike is frequently placed by a mass of twisted leav The spores are carried on the se and live over in the soil. In portio of Australia losses from this dise run from one-tenth to one-half of crop.

The take-all disease, known also whitehead and footrot, attacks roots and base of the plants, rott the roots and blackening the base the stems. Young wheat plants spe ily wither and die. Older ones m survive, but rarely produce gra Heavy losses have been sustained all countries where this disease curs.

WHY?

Those five W's—who, what, w when and where—are sure to be u by all who have two good eyes. T persistent asker is sure to secure world of information and no little s isfaction.

A Santa Paula reader has been a ing "why" and has an answer. writes:

"I was interested in the article Ernest Braunton in the February 1 number of the Cultivator. He a why does the hop twine with the

RACINE TIRES

Extra-Tested

To Yield Your Money's Worth in Miles

THERE is only one right way to buy tires—on the strict basis of character. Then you run no risk. You are sure to get your money's worth in miles.

By the thousands, farmers are turning to Racine Extra Tested Tires. More and more they realize that "Extra Tested" is the assurance of true tire character. They know that the extra care in Racine Rubber Company factories gives them extra wear, whether they choose the "Country Road" or the "Multi-Mile Cord."

Racine Country Road Tires

Racine Tires are carefully extra tested, step by step through every stage in manufacture. Fabrics and selected rubber are painstakingly selected, inspected, then given all the Racine Extra Tests. Imperfections simply can't slip by.

Racine "Country Road" Tires are specially constructed, as the name implies, for country road service. They have the extra endurance that hard usage demands. It will pay you to do businsss with the dealers who sell these quality tires.

For Your Own Protection Be Certain Every Racine Tire You Buy Bears the Name

RACINE "Country Road" 5000-Mile Guarantee

and morning glory in the opposite direction? I have found that most vines twine same as the morning glory, that is opposite from the sun, but when he states that "all vines of one kind or another turn the same way and cannot be made to grow around in the opposite direction" he is mistaken, for the smilax will twine in either direction and seems to have no choice. I have a smilax plant on my front porch, two vines from it climbing a wire, one twining with the sun and the other twining over it in the opposite direction. It is the only plant that I know of that is so careless in its habits, but there may be others.

But why confine our whys to the vegetable world? Just now we have a scourge of those little ground sparrows that stand ready to eat up everything in our gardens as soon as it appears above ground. Why do they come in the winter and leave in the spring like the tourist, and a thousand and one other whys that can have but one answer, and that is that God in his infinite wisdom saw fit to make them so."—G. W. Faulkener, Santa Paula.

REGARDING THE FENCING OF STOCK

I notice in your valuable paper a number of correspondents ask information regarding fences and trespass of cattle.

The trouble is that the laws about fences are indefinite and not precise and that a number of cases, as reviewed by different courts, reveal different verdicts.

Now I should say that if one neighbor has a lot of wild steers and not enough feed provided for them that the unfortunate animals will break any fence to get into neighboring property where they find something to eat. The law says adjoining neighbors are responsible (both of them) for keeping up their coterminous fences.

Now is this just? The second neighbor does not keep any stock at all and still he should bear a burden of expense most unjust. Therefore it behooves the farm associations to see that the law is properly amended. And the farmers can do it.

From what I can make out a bill introduced at Sacramento by Mr. Kasch of Mendocino would improve matters some if passed.

Now, Mr. Editor, sound the tocsin and see that something will be done to improve matters.—F. H.

TRACTOR COURSE AT CONCORD

A free tractor training course will be given, under the auspices of the state board of education, at the Mt. Diablo Union High school, Concord, March 10-29.

The first part of the work will deal with the study of the gas engine, with practical work in repairing and assembling engines of the tractor type. The remainder of the course will be devoted to instruction and practice in the handling of tractors and to actual practice in driving tractors in the field. At least six types of tractors will be used for demonstration.

The committee in charge is J. C. Beswick, L. C. Kellog, Carl Nichols, A. Sherlock, J. Boyd, Bertha Romaine, G. A. Ohlsson, E. E. La Barr.

A two dollar registration fee is required. Men or women who desire to take this course should send their names and addresses and the two dollar fee to Bertha Romaine, Principal, Mt. Diablo High School.

"FACING" OF BERRY PACK DISAPPROVED

The meeting held in the office of the state commissioner of horticulture on February 24 to discuss standard berry baskets was attended by representatives of the Central California Berry Growers' Association, Sebastopol Berry Growers' Association, Florin Berry Growers' Association and the United States bureau of markets, and the superintendent of weights and measures.

The question of deceptive packs was also discussed at length and it was pointed out that all facing of berries is more or less of a deception, that facing is injurious to the berries, requires additional handling, adds to the expense and subtracts from the keeping qualities of the fruit, that in the straight side, dry pints, as recommended, berries will carry much better if loosely packed unfaced, and that the demand by the consuming public is practically as great for the unfaced commodity as for the faced commodity. Mr. Grimes, therefore, proposed a resolution that the berry growers' associations represented at this meeting go on record as favoring the adoption of a loose pack and recommending the discontinuance of facing. The motion was seconded and passed unanimously.

At the recent annual meeting of the Yuba County farm bureau George Carr of Hammonton was elected president; Cline Bull of Marysville, vice-president.

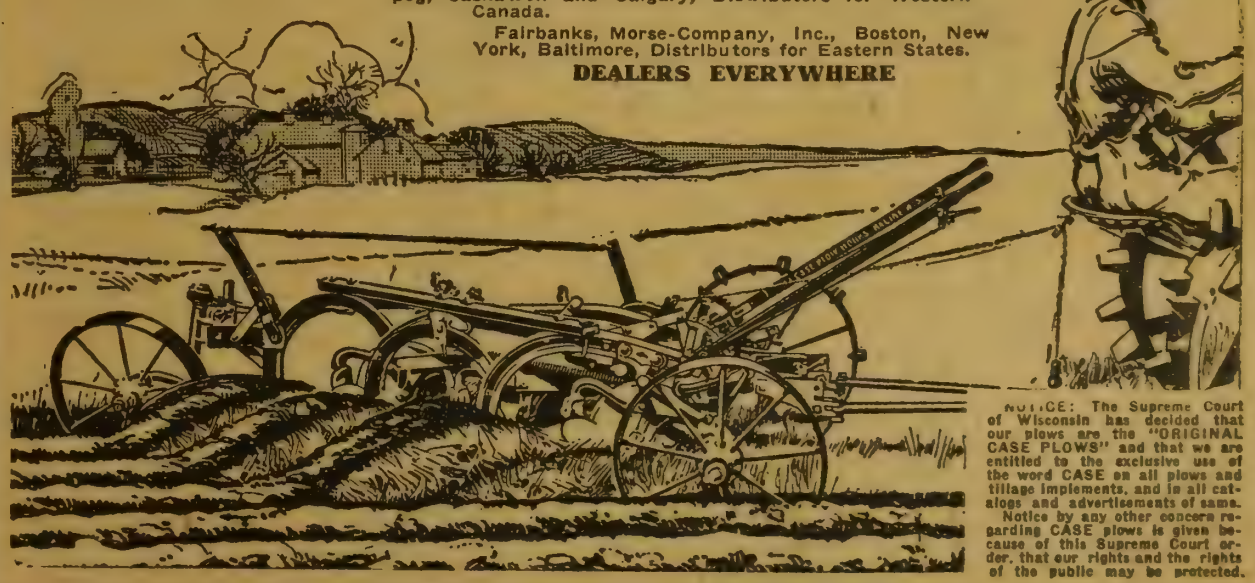
J. I. CASE PLOWS

IN J. I. Case Tractor Plows the "drag" of furrow bottom and land slide pressure has been eliminated. All the weight of the frame is carried on J. I. Case dust-proof, easy lubricating, long-distance wheels.

That's why this Tractor plow "rides" like a wheeled vehicle instead of dragging like a stone boat. That's also why more acres per day and deeper plowing are possible—and extreme fuel economy is attained.

In addition, the J. I. Case Tractor plow is easily handled from the seat of the tractor; has a simple sturdy power lift; and enters and leaves the ground instantly, points first, like a walking plow. Thus less labor is required and a more uniform quality of work is done. The Tractor is made a more profitable investment.

See your J. I. Case dealer today. He is a dealer who will justify your faith as well as ours.



J. I. CASE
Horse Drawn Plows.
Sulky, Gang, Walker models. World's lightest draft. Flexible beam and "floating" bottom insure uniform penetration and prevent shares from breaking. Strong, dependable, convenient.

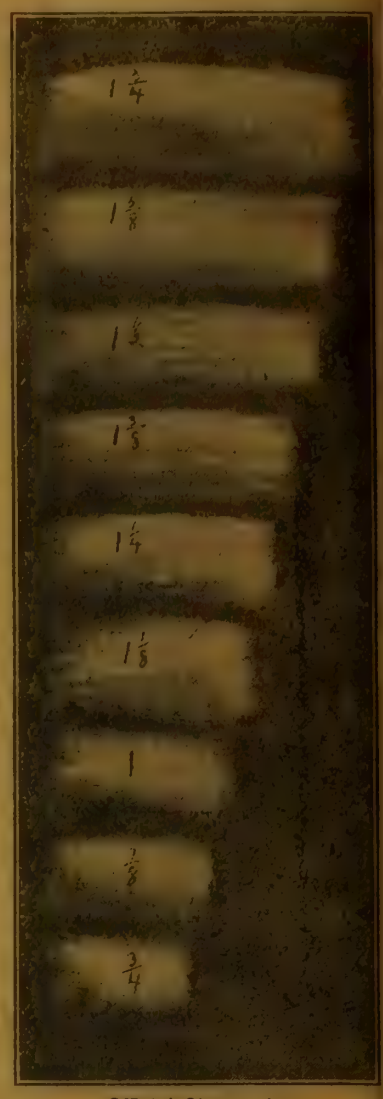
American Egyptian Cotton

THE Southwest is becoming a producer of some of the finest long staple cotton the world has seen. The bureau of markets has been making an investigation as to some of the results and some of the work which has been done in seed improvement. In a recent Service and Regulatory Announcement No. 41 is given a history of the experiments which resulted in the production of the Pima variety. The bulletin says:



There has been a great deal of information written and printed in bulletin form from time to time, relating to the introduction of Egyptian cotton in this country and its development in the Salt River Valley. The department of agriculture began experimenting with imported seed at Yuma, Arizona, in 1901. This stock, after several years of experimental breeding, produced a plant which had an improved character and greater strength of fiber. This plant gave rise to a new variety which was given the name Yuma. In 1913 commercial production of Yuma cotton had assumed such proportions as to warrant the preparation of standards so that in handling, grading and marketing it the commodity could be referred to by grade names and staple lengths. The United States department of agriculture then undertook the work of assembling types of grades and lengths of staple in the form of standards for permissive use, which, since their introduction, have largely formed the basis of such cotton in transactions between cotton mills and producers.

In 1910 a single plant of distinct type was found growing in a field of the Yuma variety, at Sacaton, Arizona. From the seed of this new plant a progeny row was grown in 1911 and more extensive plantings were made in 1912 and 1913. The most careful examinations failed to reveal any noteworthy departure from the original plant found in 1910. This variety was named Pima.

The important differences between the Pima and the Yuma varieties are that the Pima variety has a whiter color and a longer staple. The Yuma variety has a staple from 1 7/16 to 1 ½ inches in length, and the Pima a staple from 1⅝ to 1¾ inches, or an increase of from 3/16 to ¼ of an inch.

During the season of 1916 there were grown 253 bales of the Pima variety, the seed of which was saved for planting purposes, and the yield from the 1917 crop of Pima amounted to 2,966 bales. Of these, 2,260 bales were grown under the supervision of the United States department of agriculture (as were all previous productions of Pima cotton) on virgin soil, as far as cotton was concerned, and in no instance on any land where the Yuma variety had been grown previously. The ginning of practically all of these bales was done in one gin. No other variety was ginned there and the seed was carefully sacked. From this seed almost the entire crop of 1918 was planted, on an area of between 70,000 and 80,000 acres in the Salt River Valley and sections of California.

The grading and stapling of 2,100 bales of the 1917 crop were done b a representative of the bureau of markets of the United States department of agriculture, and material was collected for types. It was then decided to replace the tentative standards fo Yuma cotton with the official cotto

Official Standards

A photographic representation of th official cotton standards of the Unite States of those lengths of staple for whic types are available for distribution, eac respective length as shown being obtaine from the original type bale.—From Bu letin No. 41, Service and Regulatory An nouncements, U. S. D. A.

standards of the United States fo American Egyptian cotton, made u of types of the Pima variety.

Heretofore the grades of Pima cot ton have been designated by th names Fancy, Extra, Choice, Standard and Medium. In the official cotto standards for American Egyptian cot ton numbers are substituted for th grade names—No. 1 for Fancy; No. for Extra; No. 3 for Choice; No. 4 fo Standard; and No. 5 for Medium.

Furthermore, American Egyptia cotton which in grade is between an two adjoining grades represented b types in the standards, is designate by the grade number of the highe grade, followed by "½"; for example cotton between grades No. 1 and No 2 is grade 1½. Also cotton inferio to grade No. 5 is designated "Below grade 5." For these and other rule applicable in grading American Egyp tian cotton, the order establishing the standards should be carefully exam ined.

The lengths of staple formerly known by numbers are designated by their actual measurements, determined in the manner set forth in the order establishing the standards for length of staple and in the explanatory matter relating thereto.

Considerable spring wheat is grown in Coconino County in Northern Arizona. Some recent tests show that the new Marquis wheat grown there exceeds the best Kansas hard wheat in many qualities. An effort will be made to establish a mill in the vicinity of Williams.

Mohawks *and* Rocky Roads

Less than 222,311 miles of our total of 2,223,117 miles of highways are improved.

We could improve this percentage immensely by spending money on good roads, rather than on new tires that bad roads wear out.

Think it over. Boost good roads.

There's a rocky road, a bumpy road, or a bad strip of roadway of some sort, between you and your market. It's punishing your tires—putting a terrific strain upon them.

Many tires which may give good mileage under easy conditions won't stand up long under this abuse.

The strain may not show on their treads. For those bumps and strains don't hurt the rubber. They pound away at the fabric, sometime breaking one or two plies down underneath. The break may not show for weeks. But it is there. It spreads. Other plies give way. Suddenly, you have a blowout. You wonder why.

Mohawk tires don't give way even under such severe service as this. Most sizes have *one more ply of fabric than other makers think it necessary to use.* And this extra ply makes all the difference in the world in the strength of the tire.

Of course, Mohawks would give good mileage without this extra ply if they were always used on smooth roads and pavements.

But the Mohawk Company believes that Mohawk users cannot always pick and choose their roads. They have to go where they want to, when they want to.

Because of this we haven't skimped on a single feature. We pay more money for our rubber and fabric than most makers so that we can secure the best.

We use a generous quantity of these materials. *Mohawk Tires actually weigh more than other tires because there is more good rubber in them.* For example, the Mohawk Cord Tire weighs 8 to 10 pounds more than most other cord tires on the market.

We hire the most experienced workmen we can find and give them plenty of time to put the best they know into every tire.

There is nothing mysterious or secret about such methods. Just a reasonable logical policy of building honest tires so that every tire produced will give the buyer a good big value in mileage.

Isn't that the sort of a tire that appeals to you?

Good dealers almost everywhere sell Mohawks.

Budding Grapefruit

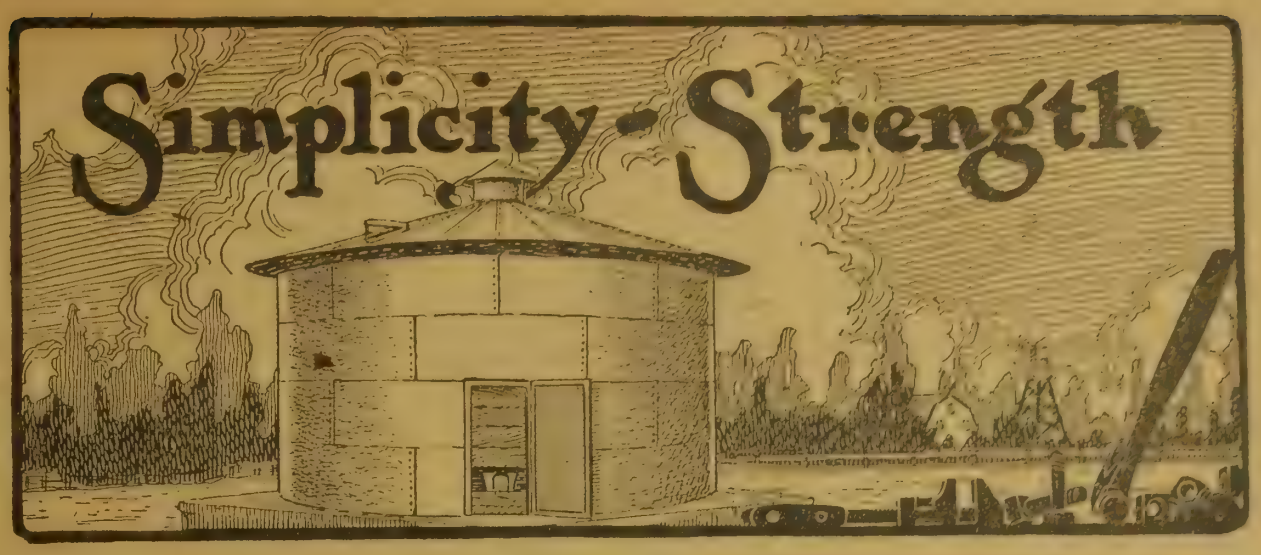
Will you please tell me the best time to bud orange, lemon and grapefruit successfully on orange trees?—Subscriber.

Yes, grapefruit are usually budded on sour orange stocks. The spring budding is usually performed in March or May and the fall budding late in September or October. Of course the budding is affected by the season. It must be done when there is full flow of sap, when the bark will readily lift as the bud is pushed into the stock.

Income Tax on Crop of Hay

Hay grown in 1917 was stored. Borrowed on this hay, $1,000. Sold hay January, 1918, for $1,200. In making return on this 1917 crop must we report the $200 or any other amount?—Subscriber, Los Angeles.

You should surely make return of the $200, likewise of the $1,000 borrowed unless that was treated as cash in your report for 1917. If not reported in 1917, then the entire $1,200 was a part of your 1918 income. The only exemption which you can claim is on any interest which you may have paid on the amount borrowed. This interest may be considered a part of the deductible expense.



Borers and Root Knot

In pruning trees I find insects have eaten under the bark of several of the trees. Some, I fear, will die from the effect. Can you tell any way to prevent that? Is there anything to use now to keep them from further destroying the trees? There are a few trees which have some false growth on the roots, some kind of a decay in the form of a bunch as large as walnuts and to twice that size. Last year I lost two trees from this. What can I do? My soil is quite sandy and I have to irrigate. Will you please let me know what treatment I can give the trees to save them?—Subscriber, Porterville.

We take it this is one of the borers, though with no knowledge of the kind of tree or insect, it is hard to prescribe. There is the California peach borer, flat-headed apple borer, twig borers, shot hole borers, and, in fact, many others. The ordinary borer which affects the trunks of apple, peach and other trees is best handled by digging out the larva with a knife or using a flexible wire, to prod them in their tunnels. When the trunks of the tree are thoroughly clean they should be whitewashed, or coated with asphaltum or the tree whitewash, formula for which was given on Page 246 of the Cultivator of February 22. Root knots may be nematode galls, but more likely it is a case of the fungus form, or crown gall. In such a case, removal of the large knots, or excrescences, is necessary, after which the fresh cut surface should be painted with Bordeaux paste. The treatment is not always satisfactory. The best control is through prevention by closest inspection of nursery trees and continual watch and instant removal of any manifestation of the trouble.

Broom Corn

The question of production of broom corn in California often comes to the Cultivator and seems to be an exceptionally hard one to answer. We recently took the matter up with one of the larger broom factories of the state and learned that the California

YOU and one of your hired men can erect a Calco Grain Bin—easily and quickly. No need to go to town and hire an "expert."

If you can hit where you look and hold a monkey wrench in place, and if you understand how a stove bolt works—you are quite expert enough to put up your Calco Bin.

Calco Grain Bins are made of Armco galvanized iron—strength. Engineers designed them to be simple in construction. In simplicity there is added strength.

Interchangeable sections are shaped and punched to fit—they lap right into each other. The door fits exactly. The manhole fits exactly. The roof fits exactly. The ventilator cap fits exactly.

It's this "fitting exactly," a good piece of designing, that makes the Calco Bin so simple to erect and so sure in strength. It's a hold-together-and-stay-on-the-job bin.

Calco Bins are made in capacities of from 600 to 5450 bushels—a size for every farm. Write for the free booklet, "Calco Grain Bins." It tells how to cut your harvesting expense.

Soil and Other Factors in Relation to Crop Production

Limiting Factor in Crop Production The economic production of the many food crops is governed directly by soil fertility. In itself, soil fertility is affected by so many factors and conditions that the greatest care should be exercised in attempting to apply too generally results secured locally or merely in one or two seasons. The limiting factors in soil fertility are many. Crop production may be directly influenced by the amount and distribution of rainfall; by the range of atmospheric and soil temperature; by adequate or inadequate aeration of the soil; by the texture as affecting root distribution; by the soil reaction; by the amounts and proportions of different salts, as well as the amount of total and available plant food.

Dominant Factors Vary From Season to Season Moreover, the limiting factor may not be the same from season to season. Soil reaction may be a limiting factor at one time; lack of moisture at another time; lack of available phosphorus at still another time and so on indefinitely, for the soil is a populous community of living things.

Temporary Results and Permanent Results Hence, in drawing conclusions as to the value of any method of soil treatment a distinction should be made between results which may be temporary in character and those that would be of a permanent nature. This fact may be best illustrated by the attitude of practical farmers in different countries toward the use of lime or of land plaster or of acid phosphate or of other soil amendments or of fertilizers.

Rational and Irrational Use of Lime In the case of lime, the excessive use of this material created a prejudice against it in many places in Europe and in North America. The injurious effect of over-liming may have been due to excessive oxidation of the organic matter in the soil or due to the toxic effect of magnesia in burned and slaked lime. As time went on the injuries or undesirable effects of over-liming disappeared and farmers in the given locality again came to feel that liming was necessary and desirable.

Rational and Irrational Use of Land Plaster One may trace, therefore, a constantly changing attitude toward the use and value of lime from one generation of farmers to another in any locality in the old world and in the new. It is well known that land plaster was regarded as a valuable fertilizer toward the end of the eighteenth century and in the early part of the nineteenth century. Later on its use was given up because it failed to give uniformly satisfactory results.

Prejudice Against Use of Phosphates There is a prejudice in certain localities against the use of acid phosphate, as there is a prejudice in certain localities against the use of other commercial fertilizers. The prejudice against any single fertilizer is readily understood by persons who are familiar with the principles of soil fertility.

Use and Abuse of Phosphates The practical farmer who secures profitable returns from the use of any material frequently attempts to continue the application of this material until it ceases to be profitable. The use and abuse of acid phosphate is an excellent illustration of this fact. It is well known that in general farming phosphoric acid is likely to be the limiting factor in production in so far as plant food is concerned. Hence, acid phosphate or other phosphatic fertilizers will for a time increase crop production by supplying a larger quantity of the plant food constituent present in least amounts, but as time goes on the use of available phosphorus merely hastens the depletion of the supply of available nitrogen or of available potassium, and the productive power of the soil begins to decline. In time, therefore, farmers begin to feel that acid phosphate has injured their soil. Low grade commercial fertilizers, containing small amounts of nitrogen and potash, will produce practically the same undesirable results.

It is evident, however, that such undesirable results are not due to the rational use of available phosphoric acid, but to the unbalanced, single use of this constituent. The use of nitrogenous or potassic fertilizers alone is certain, sooner or later, to cause a lowering of crop production, if care be not taken to provide all of the plant food constituents in adequate amounts, for such use is irrational.

Acid and Basic Residues In a similar way it is recognized by students of soils that fertilizer materials which may leave acid or basic residues in the soil might produce results that are desirable or undesirable from the farmers' standpoint. In so far as the results obtained are permanent or extending over a long period of time they are desirable wherever or whenever they are co-ordinated with larger yields and larger profits to the land owners. If, on the other hand, larger yields and profits may be obtained for one or two seasons, or for a few years only, at the cost of more or less permanent soil deterioration, they may not be so desirable after all.

Physiologically Acid Salts In a case of certain excessively basic soils, applications of certain mineral forms of Commercial Nitrogen, for instance—if losses of Ammonia as gas could be avoided at the time of application to such soils—might seem temporarily the most desirable source of nitrogen, since these salts are physiologically acid and their use might lessen afterward the accumulation of carbonates or bicarbonates. Were the use of such physiological acid salts to be continued for some years, undesirable results might appear.

Aside from the possibility of the soil actually becoming acid, there remains the danger of creating an excessive proportion of sulphates among the soil compounds.

If, on the other hand, basic materials like certain forms of commercial lime or Nitrate of Soda or Lime Nitrogen are used, basic residues might accumulate in the soil to an undesirable extent, but when such substances are used rationally and with common sense no such undesirable accumulation need occur.

One should, therefore, be extremely cautious in advocating any fertilizer practice not founded on the broad understanding of the principles of soil fertility. Especial care should be taken not to advise growers to adopt any one-sided method of fertilizing in great excess with salts physiologically acid in nature which might give profitable returns for a short time, but might ultimately entail serious injury to the crop producing power of the soil.

grown broom is of high quality, and we were assured that good prices would be paid for broom corn properly cured. The curing calls for shade for best results and the straw must be kept free from rains or heavy fogs while curing. Moisture at this time rusts and stains badly.

Under best of conditions 60 days is sufficient for production of a crop. Prepare ground and seed exactly as with milo or the other sorghums. Plant last of April or first of May. Good seed costs around ten cents per pound and about three pounds per acre is required. At present there is a wide range in prices for the corn, the price ranging from $100 to $200 per ton, this for corn after the seed is threshed out. The seed is an excellent stock feed and the residue after the tops are cut off makes fair silage. The wide range in prices is caused by the negligence in growing and curing. Long panicles, or "brush," are secured by proper cultural methods and bright color by proper curing. There are two kinds of broom corn, the dwarf and standard. The standard grows from 10 to 15 feet in height, with brush 18 to 30 inches long; the dwarf grows four to six feet with brush one to two feet long. The production per acre varies from a half ton to a ton and a half, the latter only under exceptional conditions.

Spray to Kill Stumps

The question was recently asked as to any spray which could be applied to sprouts from willow and other stumps to kill. This question was referred to the state university. Prof. Woodbridge Metcalf of the division of forestry writes:

"The cheapest and easiest method of disposing of willow and alder stumps is to blast them out with dynamite or pull them out with a stump puller. There are various chemical substances which will kill such trees but these are too expensive to make their use feasible on any considerable scale. Stumps of trees can be killed by placing a liberal application of rock salt about the roots, by boring several holes in the stump with an auger and filling these with salt or potassium nitrate, or commercial nitric or sulphuric acids. We have succeeded at the Santa Monica station in preventing sprouting from the stumps of several species of eucalyptus by boring holes in them and filling with salt. Several of them have been killed by liberal applications of kerosene oil applied with a brush directly to the stump. Peeling the stump to the ground will aid in killing it. You will recognize, I am sure, that while these methods of eradication may be feasible they are too expensive to be practicable in the removal of these trees, and the better course is to use dynamite or the better class of stump pullers."

Poor Walnuts

I have a walnut tree that has bad nuts. When the nuts begin to harden they shrivel and turn black till there is nothing left but the shell. Will it be necessary to dig up the tree or can it be grafted? I have put lime and ashes around it and fertilized it and it is a fine looking tree.—Subscriber, Hemet.

We occasionally find trees like the one described in all kinds of fruits. We have orange trees which produce only cull fruit and walnut trees which have nuts with imperfect shells, and this seems to be a variation in another direction. If this tree is vigorous and not more than eight to ten years old it can be grafted and will produce good fruit of the variety from which the scions were cut.—J. B. N.

Beans for Stock Feed

Are Lima beans good for feeding to hogs? Will soaking do any good or will they have to be cooked?—Subscriber, Downey.

Henry's "Feeds and Feeding" says: "Cull beans are fed whole in large quantities to sheep, producing a solid flesh of good quality. For swine, beans should be cooked in salted water and fed in combination with corn, barley, etc.; fed alone they produce soft pork and lard with a low melting point." "All these leguminous seeds should be ground, and on account of their protein-rich nature should not be fed as the sole concentrate. Lavalard states that when beans replace oats only half the quantity should be used." "Cull table beans are satisfactory for swine when thoroughly cooked and fed with carbonaceous feeds. At the Michigan station in three trials of from 56 to 70 days with 26 pigs, averaging 160 pounds, Shaw and Anderson found that pigs fed equal parts of cooked cull beans and corn meal made average gains of 1.5 pounds per head daily, requiring 406 pounds of feed for 100 pounds of grain. Salt should always be added to the water in which the beans are cooked. When beans are fed alone or in excess they produce a soft pork lacking in quality."

Woll's "Productive Feeding of Farm Animals" says: "These grains have a high digestibility and contain two or three times as much digestible protein as the cereal grains."

Productiveness of Cow

Could you give any rule of progression by which to judge of the amount of milk a cow will probably give upon coming to her best when you know the amount she gives with her first calf?—Subscriber, Hemet.

There is no such rule. If there were it would be broken with the second or third calf by some freak of nature which oftentimes upsets calculations. However, like breeds like, and if the mother of the cow was a great producer and the heifer is sired by a bull also from a great producer the chances are that a great producer will result. But to name the production in pounds and ounces is impossible.

Fodder Values

I find that my cows eat up very readily the "corn" fodder that I did not have room for in my silo when I filled the same in the late fall. The corn is one of the sweet sorghums. The question is, of how great additional value is the ensilage over the corn that was shocked and stowed away for winter feeding? I am surprised to see with what relish the

Ask the Man Who Has Used It

Whether or not he has made good crops with Nitrate. Why speculate with Non-Nitrated forms of Nitrogen when, by using Nitrate, you can insure crops against adverse conditions? With the rational use of Acid Phosphate, always recommended by us, there will be no interference with normal soil conditions, either in one year or in one hundred.

cows eat this fodder and I wonder if it would not be at least a grand supplemental feed to alfalfa and ensilage. How would its value compare with that of the ensilage? Would you build another silo or cut and shock the corn that you would otherwise put into it? Mine is a pit silo and did not cost over $35.—Subscriber, Hemet.

Where low-priced ensilage can be made the value over that of fodder is materially increased, that is, there is in the process of treating and maturing a beneficial effect and in addition cows will usually eat all the ensilage, while with the fodder there is material waste.

Night Soil Fertilizer

Is the waste from an outdoor toilet ever used for the purpose of fertilizing lemon trees? If so, how is it used, and in what quantity, and with what is it mixed, if anything?—Subscriber, Chula Vista.

By all means save this valuable soil enricher. If mixed with perhaps an equal quantity of dry soil it may be handled easily, and applied in a furrow within reasonable distance from the tree it will never prove objectionable and at the same time will aid in securing maximum growth of trees. If mixed with soil as suggested, a wheelbarrow load properly distributed about a tree would prove beneficial.

Eucalyptus Leaves for Fertilizer

Are the leaves of the Australian blue gum of any value for a fertilizer? It is customary here to burn them, but the owners claim they poison the ground and it is harmful to spread them on the ground.—Subscriber, Oxnard.

They surely are valuable. At least the writer has repeatedly used them as a mulch. Later they have been broken up and worked into the soil and we have never yet seen any injurious effect. The time was when orange and lemon growers carefully removed the cull or fallen fruit, and it is now known that in hauling off these culls one is removing a humus former and, to a small degree, fertility. Orchardists had feared the acid of the fruit would poison the soil. It is barely possible that if a large quantity of blue gum leaves was buried close to the roots of the tree they might cause injury. That might even be true with stable manure, but applied with reason, as probably would be the case, they should be only beneficial. However, would be glad to hear from any subscriber who has had experience along this line.

Feterita Fodder

Would like to ask the value of feterita as a hay food for cattle; also value of grain. Will it bring a good crop in the upper Sacramento river valley on bottom land without irrigation?—Subscriber, Red Bluff.

The grain value of feterita is practically that of Gyp, milo or other sorghum grains, and this is nearly the same as that of common Indian corn, though the slightly higher feeding value of Indian corn, and the fact that it is better known, continues to keep it at a higher market value. In a hog feeding test made at the Kansas station on an average daily allowance of 4.9 pounds the hogs made a gain of 1.36 pounds on feterita and 1.46 on ground corn. Milo came somewhat closer to the corn, giving a daily gain of 1.43 pounds. The fodder is valuable and should be saved. Whether it will make a good crop of grain in Sacramento valley bottom land without irrigation depends so much on conditions, especially as to rainfall, preparation of the soil so as to conserve the moisture that has fallen, etc., that it is impossible to say. As a general proposition we would say, however, yes. There are some soils so retentive of moisture that it is possible to grow a crop of barley or other grain, then plow the stubble and produce a crop of sorghum grain.

Grafting Walnuts

Can black walnut be grafted on locust or any kind of nut?—Subscriber, Turlock.

Hardly, but the native black growing wild all over the state makes excellent foundation. See Mr. Neff's article in the Cultivator of February 22.

"It Starts 'Em Right"

"That's the secret of my success! And it's *blasting* the holes that does the trick."

"When I first started to use dynamite I found out that it was an *easier* way but in two years time I knew that it was a *better* way too. Those trees grew like weeds and were in blossom a full year ahead of time."

HERCULES DYNAMITE

is a pretty good pal at planting time. It not only *digs* the holes but it loosens the soil all around them so that the roots of your young trees can take hold and *grow!*"

"There are a lot of other things that dynamite can help you do. It'll dig your post holes, cultivate your bearing orchards, clear your waste land and drain your wet land."

"Better send to the Hercules Powder Co. for a copy of their illustrated book "Progressive Cultivation." It'll tell you all about the uses of dynamite on the farm and in the orchard."

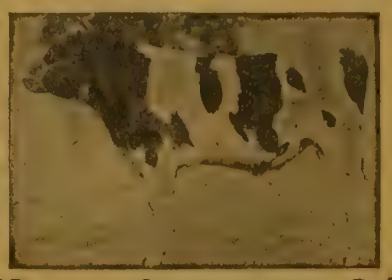
Three Great Daughters of Prince Gelsche Walker

in Our Consignment to the Guaranty Sale, March 27, 1919

Two of these are from dams with 32.76 and 31.91 pounds butter in seven days, whose sires have eight and four 30 pound daughters respectively.

Can you imagine finer foundation animals than daughters of this great sire from thirty pound dams? Never before have they been offered at either public or private sale.

And better still they are bred to SIR AAGGIE MEAD DE KOL, the highest yearly record bull in the world, with an average of 1093 pounds of butter for his first seven dams, and over 31 pounds for seven days.



We have also selected for this sale one of the most desirable young bulls ever offered in the West, a son of SIR AAGGIE DE KOL ACME out of a 34 pound junior four year old daughter of PRINCE GELSCHE WALKER. Beautifully marked and his type is beyond criticism. If interested in a real top herd sire consider this one well. Write for his pedigree.

The J. S. Gibson Co., Williams, Cal.

Adding Pounds of Beef via Good Bulls

By R. P. Royce

SOME time ago, Professor Gordon H. True of the University of California furnished the writer with some figures showing the results of a plan of cattle management that has been developed on the great Parker ranch on one of the Hawaiian Islands.

The figures are complete in that they cover a period of nine years and represent the total annual sales of beef from that outfit since 1910. Taken as a whole, it is doubtful if a more valuable or convincing demonstration of the possibility of increasing the efficiency of live stock—any kind of live stock—has been made available.

As stated above, the figures are from the books of a beef outfit—but in a more indirect way can be applied to all live stock—either dairy cattle, hogs, sheep or horses.

The Parker ranch consists of several thousand acres. For a good many years it has been operated as a cattle plant. Prior to about 1910 no especial effort had been made to follow out any of the modern methods of cattle or range management. Native cattle were handled almost exclusively and the idea seemed to be to run as many head per acre as the grass would stand—and usually the place was made to carry more than it could rightfully be expected to maintain. Little progress was made. Each year the same number of cattle were marketed at about the same weight. Gradually, it was noted that the range appeared to be deteriorating—that it was losing its carrying capacity per acre, and that the net tonnage of beef per acre was showing a decrease.

About this time, according to our understanding, the ranch came under new management—an attorney for the Parker interests was placed in charge. The new manager was not a cattleman—at the time—but his successful handling of the proposition entitles him to a high place now. He was, however, a keen business man. He knew there was a difference in cattle—that some were good—but most were of poor quality. He learned that the better cattle were better because they were better brd. And it occurred to him that there was really no good reason why the Parker cattle could not be brought up to a much higher standard. If good bulls could improve the quality in other herds, as much could be expected in their own. If, through a systematic use of such bulls, steers could be produced that would be heavier at the same age than the ones they were turning off, obviously the profits could be increased. Again, steers sired by well-bred bulls would show more quality, would dress higher and hang up a better carcass, all of which would enable the killer to pay more per pound than he could for the more common stuff. Here was a chance to add more profits—and profits were what was wanted. Being firmly convinced of the soundness of the plan, the new manager set about replacing the scrub bulls with pure-breds. He proceeded on the theory that, if a fairly well-bred registered bull was better than a scrub, then it followed that a better-bred bull would prove even more valuable—and that was the kind of bulls he purchased. Bulls of the very highest type were secured from leading breeders on the mainland. A high-class herd of females was installed for the purpose of raising the bulls that would be needed each year.

The new manager next turned his attention to the range. After a careful investigation he concluded that a much better plan of range management could be worked out than the one under which they were operating. Recognizing the fact that in order to make the most out of the cattle they should be provided with an abundant and well distributed supply of feed, and not being in a position to increase the acreage, the manager developed a system of "under-stocking." In brief, his plan was this: Rather than attempt to make every acre carry the maximum of beef, the herd was reduced, by culling out, until a point was reached where every head would have ample feed to carry it through the year in good strong condition. Under such a plan the cow herd was maintained in thrifty breeding condition, thus assuring a better calf crop, and the young stuff had sufficient feed to keep it growing steadily, thereby enabling the marketing at a younger age. By reducing the age at which the steers were marketed (through the use of better bulls, and ample feed) more breeding cows could be run than had been possible under the old plan. Along with under-stocking, water was developed, and a general practice of range control inaugurated.

As remarked before, the present plan was put in operation about 1910. That year and the year following considerable culling of the cow herd was done, and 3329 head were marketed in 1910 and 3637 head were sold in 1911. Since 1911 few, if any, cows have been sold, practically the entire sales represent steers. All of the stuff marketed has been sold to the Hawaiian Meat Company, a co-operative concern, and the dressed weight for each year's sales are available. In 1910 the average dressed weight of the 3329 head, cows and steers, was 449 pounds. The next year the dressed weight was 472 pounds, due quite largely to the fact that more age was represented in the 3637 head.

Now comes the interesting part of the story. In 1912, 2186 steers dressed an average weight of 523 pounds. In 1913, a drouth year, 2049 head killed out at 530 pounds. In 1914, 2578 steers averaged 563 pounds. The next year 2472 steers registered a killing weight of 579 pounds. In 1916, 1451 head averaged 612 pounds—an increase of 33 pounds per head. In 1917, 2015, with only about 100 head older than two years, dressed 643 pounds. During the year just closed, 2249 head (ages not given—but few older than twos) killed out at 653 pounds.

The above figures should be given the careful consideration of every range outfit in this state. In nine years this outfit raised the dressed weight of their stuff 204 pounds, and at the same time reduced the age, by nearly a year, at which time their steers were marketed. Most of the 204 pounds can be credited to the use of good bulls, some must be credited to better range management.

There is no accurate way of knowing the exact number of steers marketed in this state each year, but we have heard that the number will run between 250,000 and 350,000 head. Assuming that 300,000 head is approximately correct, and assuming that the cattlemen of this state would put into operation such a plan of cattle management as has been briefly outline, the added pounds that good bulls

would send over the scales would reach a tremendous total.

Generally speaking, the average cattleman is coming to a higher appreciation of better methods. That this is true is reflected in the rise of purebred cattle values during the past few years. There is vast room for improvement, though, and it would seem that in the face of such demonstrations, and the one just cited is but one of hundreds, that no argument should be needed. These practical demonstrations are proof positive of what can be expected and what has been accomplished on the ranch in the Pacific islands can be accomplished with as much, if not greater, ease in California. It is no longer a question as to whether one can afford to use good bulls on the range, but rather is it a question as to whether one cannot.

There are a great many cattle outfits operating in this state that are failing to register any material profit at the end of the year. Nine out of ten can be placed on a profitable basis by adopting more modern methods of operating. Production costs have mounted to new levels. Old methods will no longer suffice. The time will soon come, if indeed it is not already here, when the range man who persistently refuses to accept the better methods that have been proved sound, will go the way of the old longhorns and the Mexicans.

AN INDEX TO HOLSTEIN PROGRESS

Some of the facts shown in a survey of the registered Holsteins to be sold in the great Guaranty Sale at Sacramento, on March 27, tell a story of Holstein progress in the West possibly better than it has ever been told before. For instance, it was only a few years ago that a 40 pound cow was only a hazy dream on the Pacific Coast, and 30 pound cows were very few and far between. A 30 pound cow is worth more money today than she ever has been before, and through improved breeding and feeding practice Pacific Coast breeders have developed a substantial number of cows with records from 30 to 41 pounds butter in seven days.

But it is remarkable proof of the efforts Pacific Coast breeders are making to sell only top individuals in their classic sale, that in this sale more than 60 per cent of the 65 head to be sold are by bulls whose dams have official records from 30 to 37 pounds butter in seven days, and almost 50 per cent of the 65 head are themselves out of dams with official records from 30 to over 41 pounds butter in seven days.

Again, for the first time in the history of the Pacific Coast sales every bull to be sold is out of a 30 pound dam or better and by a 30 pound sire or better. There are six splendid young bulls in the sale and their dams have over 30, 30, 31, 33, 34 and 41 pounds butter in seven days respectively.

Truly the breeders who are founding herds today have opportunities for the purchase of high record cattle of breeding and individuality that were not available to our present breeders when they founded their herds, and the many advantages thus resulting are hardly measurable in dollars and cents.

Secretary T. W. Tomlinson of the American National Livestock Association, of Denver, says that the executive committee of the association will carefully consider Phoenix as the meeting place for the association in the early part of 1920.

The Highway to Success in Holstein Breeding

Leads to

State Fair Grounds

Sacramento, California

Thursday, March 27, 1919

THE GUARANTY SALE

Here you will have an opportunity to buy from among 65 head of picked tops from 14 leading Pacific Coast herds of registered Holsteins.

Never before in the history of Pacific Coast Holstein breeding has it been possible to assemble such an outstanding group of cattle for public sale to the highest bidder, and the breeder who is fortunate enough to secure one or more of these great animals, no matter how high class his herd at present, will have given added strength to his herd to meet the ever increasing demand for QUALITY.

EIGHT COWS WITH RECORDS FROM 30 TO 37 POUNDS. THIRTY SONS AND DAUGHTERS OF 30 TO 41 POUND COWS, almost 50 per cent of the total number in the sale.

FORTY DAUGHTERS AND SONS OF 30 TO 40 POUND SIRES, more than 60 per cent of the total number in the sale.

THE HIGHEST RECORD BULL EVER SOLD ON THE PACIFIC COAST; his dam has 41.01 lbs. butter from 831.7 lbs. milk in 7 days, and still on test; has over 158 lbs. butter from over 3500 lbs. milk in 30 days.

SIR AAGGIE WALKER, son of the 34 lb. junior 4 year old Lady Hiske Walker and sired by Sir Aaggie De Kol Acme, whose 35 lb. dam holds the world's yearly official butter record.

THE HIGHEST RECORD COW EVER SOLD IN A PACIFIC COAST SALE, Boweda, 37.62 lbs. butter in 7 days, and she is due to calve soon to the twice grand champion bull, King Segis Alcartra Prilly.

RICHLY BRED COWS AND HEIFERS BRED TO JUDGE SEGIS, whose first daughter to be tested at mature age made over 37 lbs. butter in 7 days.

COWS AND HEIFERS BRED TO THE $106,000.00 BULL, CARNATION KING SYLVIA, beautiful individuals of exceptional breeding.

COWS AND HEIFERS BRED TO MATADOR SEGIS WALKER, who now has a 40 lb. 3 year old daughter, and another 3 year old above 29 lbs.

DAUGHTERS OF PRINCE GELSCHE WALKER out of 31 and 32 lb. dams and bred to Sir Aaggie Mead De Kol, whose dam is a 34 lb. 3 year old, and he was the first bull whose 7 nearest dams averaged over 1000 lbs. butter in one year.

SOME BEAUTIFUL YOUNG DAUGHTERS OF "IT" out of 29, 32, 34 and 35 lb. dams of first rank breeding.

THE MOST REMARKABLE FAMILY EVER SOLD ON THE PACIFIC COAST, a 30 lb. granddaughter of Colantha Johanna Lad, her daughter and granddaughter. This great cow is only 7 years old and made 971 lbs. butter last year. She is on semi-official test again this year and promises to go well over 1000 lbs. butter. She has a 30 lb. junior 4 year old daughter that was first prize 3 year old at 1918 National Dairy Show, and her daughter in this sale is a full sister to the 30 lb. 4 year old. The granddaughter is out of the 30 lb. 4 year old, and is a show heifer herself. The 30 lb. cow in this family is well along with calf to Judge Segis, and the two heifers are both due in April to a son of a 31 lb. 2 year old.

You can't make a mistake buying a bull in this sale. There are six in the sale, every one out of a 30 to 41 pound dam, every one by a 30 to 37 pound sire.

For a partial list of the other individual stars in this sale read the column at the right.

No breeder who wants to improve his herd, no intending breeder who wants to lay his foundation with the best blood that money can buy, can afford to miss attending this sale. Only a small portion of the story of the excellence of these cattle has been told in this space.

Every animal is positively guaranteed to be a breeder; every animal is tuberculin tested and sold with a 60 day guarantee against tuberculosis.

How Would One of These Look in Your Herd?

A DAUGHTER OF HOLLYWOOD LILITH PALMYRA out of a 35 lb. granddaughter of Pontiac Korndyke, due April 15 to Judge Segis.

A BEAUTIFUL 27 POUND 3 YEAR OLD daughter of Ollie Johanna Sir Fayne out of a 27 lb. granddaughter of Hengerveld De Kol and bred to the $106,000.00 bull, Carnation King Sylvia.

A DAUGHTER OF THE 25 POUND 2 YEAR OLD ELDORADO WINIFRED, who is a daughter of the 32 lb. cow Winifred Hotaling 3d.

A DAUGHTER OF THE 30 POUND COW MELBA HENGERVELD, bred to the 35 lb. bull King Sadie Vale Idyl Segis.

AN 18 POUND 2 YEAR OLD daughter of the $50,000 bull King Segis Pontiac Alcartra.

A GRANDDAUGHTER OF JESSIE FOBES BESSIE HOMESTEAD out of a 28 lb. granddaughter of King of the Pontiacs, bred to the $6500 bull King Korndyke Pontiac 20th.

A DAUGHTER OF ADMIRAL WALKER PRILLY, out of a great daughter of King Korndyke Pontiac, bred to the $4,000 bull Prince Gelsche Walker Korndyke.

A DAUGHTER OF KING MORCO ALCARTRA, son of Tilly Alcartra, bred to Sir Aaggie De Kol Acme, son of the world's official yearly butter record cow Aaggie Acme of Riverside 2d.

A 30 POUND DAUGHTER of King Pontiac Netherland Segis out of a daughter of Sir Skylark Ormsby Hengerveld.

A 30 POUND GREATGRANDDAUGHTER OF KING SEGIS, and her two daughters. All three of them are bred to King Pontiac Netherland Segis 3d, whose dam has twice made over 34 lbs. butter in 7 days.

A DAUGHTER OF A 31 POUND COW, sired by the 36 lb. bull Kingmaster and bred to the 35 lb. son of King Valdessa. She made over 18 lbs. butter in 7 days last year as a 2 year old and will be fresh before sale.

A DAUGHTER OF A 31 POUND COW, due April 22 to Prince Riverside Walker.

A GREAT 26 POUND COW bred to Prince Hiske Walker, full brother to the 34 lb. junior 4 year old Lady Hiske Walker.

A BEAUTIFUL 30 POUND 4 YEAR OLD daughter of King Hengerveld, still on test.

A GRANDDAUGHTER OF RAG APPLE KORNDYKE 8TH that made 23.55 lbs. butter from 636.2 lbs. milk in 7 days as a senior 2 year old, milking as high as 95 lbs. in one day. She will be fresh before sale.

A 32 POUND GRANDDAUGHTER OF KING OF THE PONTIACS THAT MILKED 701 lbs. in 7 days.

A 31 POUND GRANDDAUGHTER OF DE KOL 2ND'S BUTTER BOY 3D that milked 615 lbs. in 7 days. Well along with calf to King Segis Alcartra Prilly.

THE GRAND CHAMPION COW at 1918 California State Fair. She has a junior 2 year old daughter now on test with 24.85 lbs. butter to her credit in 7 days.

A TWICE 30 POUND COW, granddaughter of Pontiac Hengerveld Parthenea, will be fresh before sale.

A DAUGHTER OF FORWARD PRINCE SEGIS out of a 31 lb. daughter of Sir Skylark Ormsby Hengerveld that made over 1100 lbs. butter in one year, bred to Judge Segis.

A 28 POUND GRANDDAUGHTER OF COLANTHA JOHANNA LAD due to calve the day after the sale to Chimacum Spring Farm King Pontiac.

A DAUGHTER OF JOHANNA McKINLEY SEGIS bred to the $106,000.00 bull Carnation King Sylvia.

FOUR DAUGHTERS OF SIR BESSIE HOMESTEAD SUNNYSIDE, three of them out of 29, 31 and 32 lb. dams.

A DAUGHTER OF A 32 POUND JUNIOR 4 YEAR OLD daughter of a 32 lb. cow that made over 26,000 lbs. milk and 1077 lbs. butter in one year.

A GREAT COW that has 22,070 lbs. milk and 826 lbs. butter to her credit in 305 days, milking as a senior 4 year old, and still going strong on semi-official test.

A GREAT 27 POUND COW now milking around 95 lbs. per day on semi-official test, bred to the $106000.00 bull Carnation King Sylvia.

A 22.71 POUND 2 YEAR OLD daughter of Hollywood Lilith Palmyra, out of a good record granddaughter of Pontiac Korndyke.

Milky-Way Farm

Contributes to

THE GUARANTY SALE

Sacramento, March 27

A 30 Pound Granddaughter of Colantha Johanna Lad

that milked over 700 lbs. in 7 days. Last year she made 21,222.3 lbs. milk and 971.56 lbs. butter in 365 days. She is on semi-official test again this year and promises to go well over 1000 lbs. butter. She has a 30 lb. junior 4 year old daughter that was first prize 3 year old at 1918 National Dairy Show. She is bred to Judge Segis.

A Daughter of the Above Cow

sired by one of the best sons of Sir Rag Apple Korndyke. She is a full sister to the 30 lb. junior 4 year old mentioned above, and is due in April to a son of a 31 lb. 2 year old.

A Daughter of the 30 Pound Junior 4 Year Old

mentioned above, a show heifer, due in April to a son of a 31 lb. 2 year old. She is sired by Chimacum Spring Farm King Pontiac, son of Spring Farm King Pontiac.

A 28 Pound Granddaughter of Colantha Johanna Lad

by the same sire as the 30 lb. cow above, that made 17,887 lbs. milk and 761 lbs. butter in 305 days last year. A big cow of excellent type, weighing close to a ton, and due to calve the day after the sale to Chimacum Spring Farm King Pontiac.

A Great Young Cow

that made 21,366.9 lbs. milk and 805.46 lbs. butter in one year as a senior 3 year old. She made 24.89 lbs. butter from 614 lbs. milk in 7 days as a senior 4 and continued on yearly test now has 22.070 lbs. milk and 826 lbs. butter to her credit in 305 days.

A Show Cow

that made 23 lbs. butter in 7 days as a senior 4 year old. She is by Sir Korndyke Manor De Kol Jr. 2nd and out of a 26 lb. junior 4 year old dam.

A Great 27 Pound Cow

now milking around 95 lbs. per day on semi-official test, bred to the $106,000.00 bull Carnation King Sylvia.

We invite you to look over our consignment on the sale grounds before the sale. We believe the size, type, and breeding of our cattle will please the buyer of top Holsteins.

Dispersal Sale

45 Registered Holstein Cows, Heifers and Bulls
45 High Grade Holstein Cows and Heifers

Wednesday, April 2, 1919
E. R. Putz Ranch, Near Laton, California

Mr. Putz is retiring from the breeding and dairy business and has instructed us to conduct a complete dispersal sale of his well known herd of profitable producers.

While no official testing has been done in the herd, the blood lines are substantial, representing some of the most popular lines of the breed, and the cattle are practically all young, clean, and good producers. This herd contains

24 Greatgranddaughters of Pontiac Korndyke
3 Daughters of Arcady Pontiac Wayne Hengerveld
3 Daughters of Prince Beauty Pieterje Segis

Besides the desirable young cows and bred heifers in the herd, there is a very desirable lot of unbred heifers and heifer calves that will grow into money fast for someone. Dairymen will also find some choice young bulls in this sale, although there are only a few bulls from this herd have been in strong demand and few have stayed in the herd long enough to reach service age.

The Grade Cows and Heifers

are a well marked lot, young, clean, good producers, and all that are bred are in calf to a grandson of Pontiac Korndyke, the present herd sire. Here is an opportunity to buy some grade Holsteins of high quality.

Prince Lunde Korndyke 2nd

the herd sire will be sold. He is a grandson of Pontiac Korndyke and is a fine individual. See this bull and then look over his calves in the herd and you will find that he is getting some exceptionally promising heifers.

Every animal in the sale over six months of age, both purebreds and grades, is tuberculin tested and sold subject to retest by the buyer.

THE FARM is nine miles north of Hanford on paved County Highway; three and one-half miles east of Laton; ten miles west of Kingsburg.

Live Stock News Notes

Humphrey Adds New Guernsey Bull

A. B. Humphrey, proprietor of the Grape Wild herds of Guernseys and Berkshires, Escalon, has recently secured a new herd bull from Fruit Bros., Waukesha, Wisconsin.

The new bull was sired by Rex of Richneck, and is out of Laura's May of Maple Hill, a cow with a record of 624 lbs. fat as a three year old.

New Poland China Futurity

According to Charles Paine, secretary of the California State Fair, the American Poland China Record Association has announced that in addition to the regular futurity show sponsored by that association, plans have been worked out for a junior yearling futurity for the 1919 fairs.

The new classes are for animals farrowed between March 1 and September 1, 1918, and any animal farrowed in a herd nominated last year will be eligible to compete as a junior yearling, provided the owner makes the specified payments.

The prize list provides for six places and the first prize is $60.

All that is required of a fair desiring the new futurity is that the management contribute 25 per cent of the prize money.

Mr. Paine states that the board of directors for the California State Fair have not decided in regard to the plan. It is to be hoped that provision will be made.

Futurity shows have accomplished much for the various breeds of live stock. They offer encouragement to young breeders and tend to stimulate better management practices. Heretofore, the swine futurities have been for pigs. This new plan aims to encourage breeders who have developed pigs, to carry them on for another year.

Wyoming Herefords at Denver

At the recent Denver live stock show the Hereford Corporation of Wyoming, Cheyenne, exhibited the reserve champion load of calves and the second prize load of yearling heifers. The calves were sold to a Canadian outfit and the yearlings were purchased by Cyrus Tow, a well known Hereford breeder of Iowa. It will be recalled that the Hereford Corporation exhibited cattle at the Liberty Fair, Los Angeles, and that their showing made a fine impression upon California cattlemen.

In many respects this herd stands as one of the remarkable collections of Herefords in this country. Established in 1883 with the largest single importation of Herefords ever brought to this country, it has been developed and expanded without the purchase of additional females—new blood being added through the use of superior bulls.

William Cox, who was in charge of the cattle shown on the Coast, states that the herd is coming through the winter in fine condition and that it is expected that the 1919 calf crop will be quite the best yet dropped on the ranch. Demand for bulls has been unusually good—reflecting the general demand for Herefords that has placed this breed on extremely high level and made possible the registering of the world's record sale.

Hereford Calves Average $920

In the recent sale held in Chicago by Col. E. H. Taylor, proprietor of the famous Hereford Farms, Versailles, Kentucky, 42 head of calves sold for an average of $920. One bull calf, Woodford 41st, commanded a bid of $5500, and the yearling heifer Belle Woodford 32d brought $2000.

Murphy Sells Boar to Nevada

G. A. Murphy of Perkins has sold the young Berkshire boar, Duke's Laurel Combination, to J. R. Densmore of Las Vegas, Nevada. The boar, farrowed last August, was sired by Wilsonia King Laurel, a son of Laurel Champion, and is out of Duke's Combination Lady, by Duke's Combination 13th. Duke's Combination Lady was sold, in the recent Western Berkshire sale at Davis, to W. F. Sandercock, Sacramento, for $155.

Beckman Adds Eastern Polands

Geo. V. Beckman & Sons, Poland China breeders of Lodi, have recently received a young boar and bred gilt from the Meharry herd in Illinois. The boar, Lakeside Defender, was sired by Chief Defender's Choice, the boar that as a pig was purchased by R. A. Welch of Red Oak, Okla., for $2250. The latter boar is a litter mate to Big Improver, grand champion at the 1918 Iowa state fair.

The dam of Lakeside Defender is Hadley's Best 2d.

It will be recalled that the senior herd boar in the Beckman herd is Matchless Big Bob of U. F., a boar that was sired by Big Bob Orange 3rd, formerly at the head of the University herd. The junior boar is very much after the same type. He gives promise of developing plenty of size and will undoubtedly mature into an exceptionally well balanced boar with splendid quality.

The gilt referred to above is a litter mate to the boar and is is carrying a litter to the service of Big Square Jumbo, an Eastern boar of prominence.

The Beckman family has been hand-

FOOD PRODUCTION MUST BE INCREASED

The horse is a vital factor in such accomplishment. His efficiency is measured by the degree of fitness for constant use.

Stuffed Collar Pads

Are the only guarantee against bruised, galled and chafed shoulders. They are better than other kinds, being soft, springy and absorbent. They make possible the continued use of a horse collar long after its worn condition would otherwise compel its discontinuance.

New Patented Hook Attachment

(Found only on pads made by us)

Consists of wire staple with felt washer. It gives hook a firmer hold and prevents pulling off, even though fabric is weakened by long usage. The greatest improvement since we invented the hook. Ask your dealer for Tapatco Booklet.

Belknap Increases Sale Offering

In a recent letter from D. L. J. Belknap, San Jose, who will disperse his entire herd of Durocs March 18, he says:

"I have just added two yearling bred gilts, of very high class, to my herd and they will be sold in my sale. Both are by Crimson Monarch 2d, grand champion at the 1917 California state fair, and are out of the good sow Monarch's Beauty that sold in the Rucker sale for $500.

"My hogs are doing nicely and I am anticipating a successful sale."

Ireland Ranch Gets Hogs from Ohio

The Ireland ranch, at Owensmouth, California, has just received by express a consignment of hogs, purchased in the sales rings of Ohio. A spring boar, tracing back to Joe Orion II, and that wonderful sow, Willetta J, on his sire's side, with Orion Cherry King and High Lady on the dam's side. They plan to cross with their gilts sired by Cherry Volunteer II, the grand champion of the Riverside Fair in 1918 . Two sows, daughters of Pals Perfection, with intensive King of Col's breeding are bred to Joe Orion Cherry King IV, for March litters, and these litters may be a factor in the futurity herds of next September.

BERKSHIRE CONGRESS PLANS CAMPAIGN

By Frank B. Anderson, Secretary, Western Berkshire Congress

An enlargement of the field for promoting the interests of Berkshire hogs on the Pacific Coast and contiguous states will be undertaken by the new administration of the Western Berkshire Congress, consisting of A. B. Humphrey, president; James Mills, vice president; Frank B. Anderson, secretary, and George Murphy, Mrs. A. C. Hardy, J. Francis O'Connor, H. C. Muddox, W. F. Sandercock and Homer Hewins, Jr., directors. Many special attractions in the way of sales and shows are planned for this year.

The congress directors will ask that the state fair create a class for barrows under six months, open to all breeds, grades and crosses, using March 1 as the base date.

Mixed sales of Berkshires will be held in various counties, beginning with a sale at Martinez about the middle of April, at which consignments are open for bred sows, gilts, young boars and weanling pigs of both sexes. Each sale will carry a guarantee. J. Francis O'Connor, the director in charge of the initial sale, has a number of entries already from various breeders who are going to offer their hogs for sale at the farmers' own door steps and at their own prices.

To popularize the Berkshire among the young folks—and that takes it to many farms where perhaps no hogs or only scrubs are now raised—the Western Berkshire Congress has placed a special price of $15 a head on weanling sow pigs for boys' pig clubs.

J. Francis O'Connor has offered a boar or sow pig out of Riverby Princess, the P. P. I. E. grand champion, or Rookwood Lady 100th, the 1917 National Swine Show champion, to the member securing the most new members from January 1 of this year to July 1. H. C. Muddox has put up a cup to the breeder who starts the most new Berkshire breeders in the business during the year of 1919.

Efforts are being made to have the American Berkshire Congress meet with the Western Berkshire Congress at Davis next February, which would be one of the biggest attractions yet held in Berkshiredom.

PAINT PAYS

The wise and frugal farmer plies the paint brush during the spare time as he understands the dual value of paint in protecting against decay and weathering and in improving the sightliness of the farm buildings. If the farmer feels that he can not afford to use paint on his buildings, he at least can utilize cold water paint or whitewash. The disadvantage of these materials is that their use requires more labor, for they must be applied every year, and if the owner wishes to use oil paints later on he will have to scrape away all the whitewash first.

CUNNINGHAM STRENGTHENS HIS BILLIKEN HERD

C. B. Cunningham, Mills, owner of the Billiken herd of Chester Whites, has just received a very high bred gilt from the McAnaw herd, Cameron, Missouri.

The gilt, Emily Wing 2d, was shown as a senior pig last fall and was first in class and junior champion at the Missouri State Fair. She also won the silver cup offered for the best Chester White gilt. Later, in a very strong show at Nebraska she stood second in class, and was seventh in a class of 24 at the National Swine Show at Cedar Rapids, Iowa. She was also a member of the young herd that was first at Missouri, Illinois, and the two Kansas state fairs, second at Nebraska and eighth at the National.

The gilt was sired by Joe Wing, whose get won 154 prizes at five state fairs and the National. She is bred to the $2500 Model's Wonder, the sire of Alfalfa Wonder, junior champion at the 1918 Nebraska show.

Cunningham states that when she was unloaded she weighed 412 pounds and that she was considerably thinner than he keeps his sows.

Mr. Cunningham has also received a last spring gilt from the Vaughn herd at Marion, Iowa. She was sired by Wildwood Type, a boar by Highland Chief out of a sow by the $6000 Wildwood Prince. She is due to farrow this month to the service of Aristocrat, a son of Chickasaw Kossuth.

Both sows are strictly big type and when bred to the big type boars now in the Billiken herd should produce the type of hogs for which the herd is noted.

Mr. Cunningham is president of the California Swine Breeders' Association.

Dependable Holsteins at Public Auction

60 Cows, Heifers and Bulls

on Packwood Farm

Owned by WALTER F. MITCHELL

Visalia, California

Thursday, April 3, 1919

Mr. Walter F. Mitchell, one of the longest established breeders of registered Holsteins in California, has instructed us to sell to the highest bidder every female in his herd that is of milking age. The sale will also include some choice bred and unbred heifers, and a few good bulls of service age or near service age.

Mr. Mitchell is not retiring from the breeding business in which he has been so successful. He is retaining for future breeding females all of the daughters of PRINCE HISKE WALKER, the splendid young sire now heading the herd, out of the good cows that will be sold in this sale.

The Sale Will Contain:

FOURTEEN COWS AND HEIFERS with official records up to over 31 pounds butter in seven days.

NINETEEN GRANDDAUGHTERS OF SEGIS PONTIAC DE KOL BURKE, one of whose daughters holds the California record for butter in one year in the senior two year old class with a production of 932.44 pounds in 365 days, and another holds the junior two year old state record with a production of 851.01 pounds butter in 365 days.

THIRTY-NINE COWS AND HEIFERS bred to Prince Hiske Walker, who is by Prince Gelsche Walker and out of Hiske of Riverside, making him a full brother to Lady Hiske Walker, 3425 pounds butter in seven days as a junior four year old, former state record in class.

THREE DAUGHTERS OF ARCADY PONTIAC WAYNE HENGERVELD, who has the largest list of A. R. O. daughters of any bull yet developed on the Pacific Coast.

A BEAUTIFUL DAUGHTER of Spring Farm King Pontiac 6th that will be fresh before sale.

A PAIR OF TWIN HEIFERS out of a great 26 pound dam.

PRINCE HISKE WALKER will be sold as Mr. Mitchell is keeping only his daughters. He is a high class herd sire for someone, and as his large number of daughters are mostly in the hands of Mr. Mitchell and Mr. H. E. Cornwell, Modesto, there is every assurance that they will be developed and given official records.

SOME GOOD YOUNG BULLS will be offered in this sale, out of choice dams and sired by Prince Hiske Walker, Segis Pontiac De Kol Crane, and Sir Veeman Korndyke Pontiac, 30 pound son of Sir Veeman Hengerveld.

Every animal positively guaranteed to be a breeder; every animal tuberculin tested and sold subject to retest.

Catalog free on request.

Remarkable Family in Guaranty Sale

What is generally admitted to be by far the most remarkable family group ever contributed to a western Holstein sale is found in the contribution to the Guaranty Sale, Sacramento, March 27, from the herd of Albert E. Smith, Sumas, Washington. The key animal of this group is the cow Ava Model Hengerveld 2d, now milking in her six year old form. She is by a good son of Colantha Johanna Lad and out of a granddaughter of Hengerveld De Kol, thus combining the blood of two of the very greatest sires of the breed. Milking as a five year old this great cow made 21,222.3 pounds milk and 971.56 pounds butter in 365 days, and at her last freshening as a six year old made 30.53 pounds butter in seven days from 708.7 pounds milk. She is again on semi-official test and now nine months in milk promises to go well up toward 1100 pounds butter this year.

She is the dam of Korndyke Model Hartog, who was first prize three year old at the National Dairy Show, Columbus, Ohio, last year, and who made an official record of 30.84 pounds butter from 569.7 pounds milk in seven days shortly after coming off the show circuit.

A full sister to this 30 pound junior four year old is one of the family group in this sale, and she is due to calve in April to a son of a 31 pound two year old.

A daughter of the 30 pound junior four year old is the third member of this remarkable group, and she also is due to calve in April to the same bull, son of a 31 pound two year old.

Ava Model Hengerveld 2d herself is well along with calf to the famous Judge Segis, the great Hollywood sire whose first daughter to be tested at mature age made over 37 pounds butter in seven days.

The fourth member of this group is De Kol Butter Boy Belle 2d, by the same sire as Ava Model Hengerveld 2d. As a five year old she made 28.08 pounds butter from 700.7 pounds milk in seven days, and 17,887 pounds milk and 761 pounds butter in 305 days. She is a splendid big cow, weighing close to a ton, and is due to calve the day after the sale to Chimacum Spring Farm King Pontiac, son of Spring Farm King Pontiac.

Sale of Arizona Holsteins

The Sanders-Bradshaw sale, held at Phoenix, Arizona, February 5 and 6, was a decided success.

As it was the first large affair of its kind held in the baby state the results were very encouraging to present and prospective breeders of pure-bred cattle generally, inasmuch as they demonstrate the fact that there has now been established there a market for this class of animal.

Below is given a list of all cattle, with purchasers, selling for over $200:

M. W. Turley, Tempe. DeKol Robina Roxanna, $1025; Korndyke Aaggie Queen 2d, $245; Lady Alice Aralia Lorenzo Snowball, $215; Lady Vernon Lorenzo Aaggie Maxima, $220; Lady Aaggie Lorenzo Snowball, $210.

B. Coman, Phoenix. Frontier Mona Korndyke, $2000.

Orange County, Santa Ana, California. Aaggie Lieuwkje Emporia, $600; Mercedes of Alhambra, $575; Margaret Jewel DeKol, $450; Aralia Mercedes King (male), $325.

University of Arizona, Tucson. Palo Verde Snowflake DeKol, $700.

B. Van Blaricom, El Monte, California. Brookline McKinley Aaggie, $600; Arizona Dichter Girl, $400; Wolverine Mary Walker, $375.

F. M. Wolf, Scottsdale. Arizona Dichter DeKol Van Beers (male), $800.

Frank E. Empey, Tempe. King Lilith Pontiac Segis 2d (male), $620; Jewel of Arizona, $400; Piebe Paul Aaggie Colantha, $200; Lady Robles Pietertje Aaggie, $200.

J. R. Norton, Phoenix. King Lilith Pontiac Segis 4th (male), $500.

J. S. Elliott, Phoenix. Arizona Korndyke Queen Spofford, $425; Celia Brookline Tucker, $430; Cornucopia Cedarcrest Korndyke, $400; Edith Luecke DeKol, $340; Pambytuning Butter Boy Ann, $215.

McALISTER & SON MAKE SENSATIONAL CONSIGNMENT

McAlister & Son, Chino, have not only developed some of the top Holsteins on the Pacific Coast in their own herd, but they have also sold a large number of high class animals that have made wonderful production records in the hands of other breeders. They have always made it a practice to sell some of their very best in the high class sales, and their contribution to the Guaranty Sale, Sacramento, March 27, exceeds any of their previous efforts. The highest record cow in their consignment is a fine granddaughter of Pontiac Hengerveld Parthenea, and she has twice made over 30 pounds butter in seven days, her best record being over 31 pounds. Then there is a remarkable granddaughter of Rag Apple Korndyke 8th that milked as high as 95 pounds in one day on official test as a senior two year old.

But the real sensation of the contribution is found in the opportunity that McAlister & Son have provided for other breeders to secure some of the most highly bred daughters and sons of their famous sire "It" that they have in the herd. There are six daughters of "It" in the offering. It Tola, out of the 33.98 pounds K. P. Tola has an average of 30.17 pounds butter in seven days for her seven nearest dams; It Segis Clorinda, out of a 29.39 pounds three year old daughter of King Segis Pontiac, has an average of 29.88 pounds butter in seven days for her seven nearest dams; It May Korndyke, out of the famous 30 pound three year old May Korndyke, has an average of 30.58 pounds butter in seven days for her three nearest dams; It Idyl Segis, out of the 35.61 pound junior four year old K. P. Idyl Segis, has an average of 31.88 pounds butter in seven days for her three nearest dams; It Meta Kuperus, out of the 32.44 pound senior three year old Meta Ward Kuperus, has an average of 34.82 pounds butter in seven days for her dam and sire's dam; and It Changeling Wildwood, out of a 27.23 pound junior three year old daughter of Changeling Butter Boy, has an average of 30.78 pounds butter in seven days for five of her seven nearest dams.

Two splendid young sons of "It" in the offering should meet with keen appreciation on sale day. One of these is It Cornucopia Wayne, out of a 31.42 pound daughter of Sir Sadie Cornucopia, and having an average of 30.03 pounds butter in seven days for five of his seven nearest dams. The other son of "It" is out of the now noted Ontario Blonde Pietje, who made over 30 pounds butter in seven days last year as a junior four year old and came back this year with 33.07 pounds butter in seven days, 127.25 pounds in 30 days. Five of the seven nearest dams of this great youngster average 32.92 pounds butter in seven days.

NATIONAL MILK EXPOSITION

Announcement is made that New York again will be the scene of the National Milk and Dairy Farm Exposition. It will be held in the 71st Regiment Armory during the week of April 21st, and judging from present indications, it will be far the best exhibition of its kind ever held. Those in charge of the exposition are planning to make it worthy of the support and patronage of every one interested in the milk, dairy farm and allied industries. Nearly $100,000 is being put into this exposition to convince the milk consuming public of the food value of milk; also that milk costs are reasonable and that a big milk industry is involved. The exhibition will be a big "store window" in which everything pertaining to the management of the dairy industry will be exhibited for the benefit not only of those interested in the industry but to the layman as well.

The Armory will be filled to overflowing with exhibits of all forms of milk foods, milk products, processes of milking, handling, machinery and equipment, and all manner of things relating to the dairy farm and its allied interests.

GREAT HEREFORDS TO CALIFORNIA

C. R. Thomas, superintendent of live stock at the Liberty Fair, and formerly secretary of the American Hereford Breeders' Association, has just returned from Kansas and Missouri Hereford centers with a full car of the finest Hereford bulls to be had in this country. These were purchased for the Diamond Bar ranch in eastern Los Angeles County, owned by F. E. Lewis II. These great bulls are to supplement purchases made during the past few months by Mr. Lewis. He began at the Liberty Fair, cleaning up practically all ribbon-winning, pure-bred Hereford cattle at that fair. He now has on the Diamond Bar ranch some 640 pure-bred cows, and it is anticipated that he will commission Mr. Thomas to keep in touch with Hereford activities and secure for the Diamond Bar the very best. This will be by far the largest gathering of Herefords south of Tehachapi.

PURE BRED SALE IN ARIZONA

By M. E. Bemis

The pure bred livestock industry received an impetus at the auction sale of pure bred Holstein-Friesians held on the state fair grounds early in February. This was the first big sale of pure bred cattle held in the state and was advertised nationally. Many breeders came from distant states and a considerable number were sold to go outside the state.

The highest prices were for two cows, one selling for $1025 to Mr. Turley of Tempe and one for $ 000 to B. Coman of Phoenix. The Orange County Home of California purchased a number of very fine animals, one was a two year old daughter of King Segis Pontiac Climax which sold for $600. Several cows at around $500 each were included in the list.

Mr. Van Blericon of El Monte, California, also purchased a number of good cows. One carload was purchased by Latta and Redd of El Paso, Texas. The sale netted a little over $40,000.

The number of dairy cows in Arizona, according to the estimate of the United States department of agriculture, is 72,000, a slight decrease in the number one year ago. The number of range cattle is 1,100,000, the same as given for last year. Sheep decreased from 1,500,000 to 1,400,000. There was also a slight decrease in swine, the number now being given as 58,000.

Stock need a spring tonic.

Most stock ailments come from winter conditions. Dry feed and lack of exercise weaken the digestive system, stunt the appetite, and poision the blood so that stock get wormy, do poorly, and waste feed.

Right now all farm stock need help—for it is freshening time, farrowing time, and plowing time.

Dr. LeGear's Stock Powders

are the most effective tonic you can use—will quickly put your stock in tip-top condition. Get more milk from your cows, more work from your horses and mules, bigger and quicker gain from your hogs, sheep and beef cattle.

My stock powders are *my own personal prescription* developed in my 26 years of actual experience as a graduate veterinary surgeon. They contain Iron for the blood, Nux Vomica for the nerves, tonics for the appetite and digestion, laxatives for the bowels, kidney regulators and worm expellers.

Dr. LeGear's Stock and Poultry Remedies are sold by 40,000 of the best dealers—never by peddlers.

Dr. LeGear's Poultry Powder keeps hens healthy, insures winter eggs, and means more profits to you.

Dr. LeGear's Antiseptic Healing Powder cleanses, drys and heals sores and cuts quickly.

Dr. LeGear's Lice Killer (powder) rids your flock quickly of lice, protects chicks, etc.

Free sample—ask your dealer.

Get a liberal *free sample* package of Dr. LeGear's Stock Powders or Dr. LeGear's Poultry Powder, also free copy of Dr. LeGear's reference book on Stock and Poultry.

Herefords of Quality

From Leading Pacific Coast Herds

The wide selection of high class cattle in this sale will satisfy the requirements of breeders wanting high quality breeding females or herd bulls, as well as providing an exceptional opportunity for the rangeman to procure bulls of outstanding fitness for range work.

Second Pacific Coast Hereford Breeders' Sale

Wednesday, April 9, 1919

University Farm, Davis, California

There is urgent need for the establishment of many more breeding herds of registered Herefords on the Pacific Coast to supply the higher class, pure bred bulls that changing conditions in cattle growing demand.

80 Registered Hereford Cows, Heifers and Bulls

will be sold in this sale, representing some of the famous Hereford families that have repeatedly demonstrated their worth in the show ring and on the range. Plant some of this seed in your herd now. The earlier the planting, the earlier the good harvest.

Catalog in preparation. A copy free on request.

Sale under auspices of

THE SALE AT BUTTE CITY RANCH

By Bruce S. Bennett

The initial sale of Butte City Ranch was held in Butte City Saturday, March 1, and it was stated that this was the first sale of the kind ever held in this section.

Butte City Ranch was established a few years ago by W. P. Dwyer and W. S. Guilford and had as its aim the providing of seed animals especially in their community.

In conversation with Manager Guilford after the sale he stated that the sale was in every way highly satisfactory, and while the animals did not always bring their full value or as much as they could have been sold for at private sale, they had accomplished their purpose of planting a seed here and there on the farms in their community.

The sale was not advertised as a breeder's sale but as a farm sale, and every effort was made to get the farmer there, with the result that about 500 of them responded.

The morning was spent inspecting the sale animals, during which time music was dispensed by the band from Willows.

After a very appetizing lunch interesting talks were made by Judge Shields of Sacramento; E. H. Grubb, an agricultural authority of International reputation; Professors True and Thompson of the University of California; A. B. Humphrey, a noted breeder of Berkshires and Guernseys, and president of the Western Berkshire Congress, and J. Francis O'Connor, a director of the same organization.

The first offering in the sale comprised 30 Berkshires ranging in age from four to six months, part of which were sired by a son of the much talked of English boar Epochal, the prices ranging from $50 to $90.

Next came the Shorthorns, the offering consisting of 12 young bulls and eight heifers.

The prices secured, while in one way very satisfactory were not such as would have been secured at a breeder's sale. The young bull Royal Rancher 9th, by Prince Imperial and out of Lady Gem, topped the sale at $235, followed closely by the young heifer Princess Adeline, by Prince Imperial and out of Hickory Bub 5th, at $225. The prices for the entire lot ranged from $140 to $235, averaging around $175.

The children now had their inning, as the next in line was the ponies. One little miss stood by the ring and bid until she secured the pony she wanted.

Last, but not least by any means, came the sheep, and it looked as if all the remaining buyers were there for the sole purpose of securing one or more head. The bidding was quick and lively and 20 head were sold in about as many minutes, netting their owners about $65 a head.

Both the owners and the purchasers seemed pleased with their day's work and it is to be hoped that like sales will be held in other communities during the year.

It is the purpose of Butte City Ranch to make these sales an annual fixture and their aim to make their county and community the center of the pure bred live stock industry of the state.

ZEBRA-MULES

The hybrids obtained in the United States are very vigorous, and resist the cold of temperate regions as well as does the ass. They show a decided improvement over the parents as regards their form, movements, and way of standing.

The cross, she ass x zebra, are very obstinate and hard mouthed, which constitutes an obstacle to their use as working animals. On the contrary, the cross, mare x zebra is more docile and tractable, and can be used like the mule, over which it has the advantage of being much better shaped.

In crosses made in the United States between mares and zebras, the stripes in the coat of the hybrid were indistinct, and the characters of the mother predominated. In other crosses made in South America and Europe, the characters of the father were predominant, and the stripes were still more marked than those of the father.

Unsigned communications receive no attention.

Warts

We have a two year old Jersey heifer. Of late several growths have appeared on the top of her head and the last few days one has come on her eye. They resemble a seed wart and range from the size of a pea to almost the size of a walnut and are light or almost white in color. Please advise us how to remove them and the cause of the growths. We have used iodine on them twice.—Subscriber, Victorville.

Warts do develop that way sometimes and nobody can account for them. Oil them once a day with castor oil and they may go away soon; if not then use nitric acid. Apply the acid with a swab once or twice a week. Be careful with the acid and do not allow it to touch your skin or clothing. It is a powerful caustic and will burn a hole. There is a ringworm that sometimes appears about the heads of young cattle, that has a silver white appearance and might be thought to be warts, but they do not raise up from the skin. The hair drops out and the skin has a white scaly appearance. This is contagious and may show on the other cattle. They get it from rubbing on the same posts or against one another. Your treatment of iodine will cure the ringworm but to prevent it spreading you

Ringbone

We have a young horse that is lame in the hind foot. Some say it is ringbone. He has been lame for some time and there is a growth just above the hoof about the size of an egg. Is it joint lameness or not? Which is best; to have a veterinarian burn it or to just blister it?—Subscriber, Potter Valley.

Ringbone starts with inflammation of the joint between the fetlock and the foot and is caused by an injury from a bruise or strain or from rheumatism. The inflammation destroys the joint oil and the smooth cartilage that covers the ends of the bones, then the two bones grow together like the ends of a broken bone. The enlargement is a deposit of cartilage that nature provides to hold the bones in place while the ends are uniting, and in time this turns to bone also. To hasten the process of making the two bones one we fire and blister the skin to increase the flow of blood to the parts. You had better have your veterinarian blister and fire it and then you repeat the blistering every two weeks until four or five blisters have been used. When the joint becomes solid the lameness will cease but the horse will have one less joint and will walk clumsily and only be useful on the farm although some do very well on the road.

BACK-LOT POULTRY PLANT

Continued from Page 323

three parts cracked corn. The chick mash formula is: three parts rolled oats, three parts wheat, four parts white milo, four parts red milo, two parts cracked corn, ten per cent dried buttermilk, five per cent Darling's meat scrap, one pound fine ground bone. Poultry people who are looking for a more rapid growing feed for their chicks will do well to copy this formula and try it, for some of Mr. Ruess' chicks, a cross of Dark Cornish on Rhode Island Red, have reached broiler weight, 1½ pounds, in six weeks. Part of this rapid growth is no doubt due to the cross, but a great deal is due to the feeding. This mash is not fed dry. It is moistened with semi-solid buttermilk, diluted in the proportion of one pound of buttermilk to 1½ gallons of water, and is fed at first four or five times a day, but after ten days is left before the chicks all the time. The scratch is fed twice a day, at 10 o'clock and 2 o'clock, and greens are given at noon.

The mash for the layers and breeders consists of ten pounds milo whole and cracked, two pounds bran, one pound cracked corn, one pound rolled barley, two pounds wheat, eight ounces dried buttermilk, 12 ounces Darling's meat scrap, ten ounces ground bone, one quart charcoal. This is moistened, like the chick mash, with semi-solid buttermilk diluted with water, and is fed at night. The scratch feed, which is fed in the morning in deep litter, consists of two parts wheat and one part cracked corn. Grit, shell and charcoal are before the birds all the time. Mr. Ruess does not beleive in keeping a mash constantly before laying hens. "Hens that nibble all the time are just like people that are constantly piecing," he declares. "They don't amount to anything." While this view is quite different from that commonly held, it is well to remember that the Little Compton poultry farmers, who made a conspicuous success in Rhode Island a good many years ago, fed only a moist mash.

A Tractor Must Have Reserve Power Such As This Case 10-20

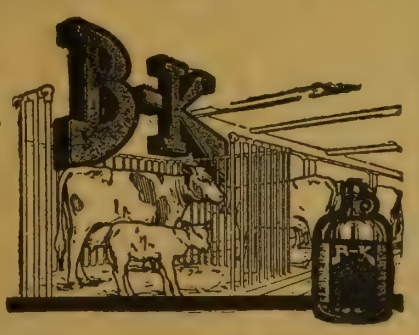
THOUSANDS of Case 10-20 Kerosene Tractors are in use all over the country—probably in your neighborhood. We are proud to state that one of their outstanding features is Reserve Power. Owners everywhere tell us that these tractors easily meet unusual conditions. They are ready for frequent and unexpected overloads.

The drawbar rating is 10 horsepower, which is equivalent to a 1650 pound pull while traveling 2¼ miles per hour. But this sturdy machine will exert a pull of 2600 pounds on the drawbar, when necessary.

This shows our conservative rating. The 10-20 is recommended for pulling three 14-inch plows, which it handles easily in sod or stubble. The Reserve Power is always at hand for more difficult jobs or for grades.

And the Reserve tends to prolong the life of the machine, for it is usually working at its normal capacity. Continuous, undue strain is thereby avoided.

This Case 10-20 will also handle other implements usually requiring 8 to 10 horses, such as two 7-foot binders, two 20-shoe grain drills, eight sections spike-tooth harrow, 8 to 10-foot double disc harrow and other implements of like requirements. For belt work, this tractor has proven equally efficient. It drives a Case 20-inch cylinder thresher with wind stacker, feeder and grain handler. Also silo fillers, hay presses, feed mills, etc.



For all 'round use this Case 10-20 demands your investigation. It has proved its worth. It is economical in operation, *burning kerosene successfully.* It is built of the finest materials. It is bound to give maximum value for your money.

Investigate the Case 10-20 and other sizes of Case Kerosene Tractors before you decide.

A complete description of the Case 10-20, with pictures and specifications, will be sent free upon request. Or visit a Case Dealer.

Flush Cows After Calving

Protect your herd against Contagious Abortion and Barrenness.

Barrenness or Sterility, like Abortion, Retention of After-birth and Premature Birth, is nearly always caused by infection of the reproductive organs by the germs of Contagious Abortion. Unless this infection is promptly overcome by the use of a powerful but safe antiseptic, it may permanently affect the reproductive organs so that the cow will continually fail to stick.

Every time a cow drops a calf—whether alive or dead—by premature birth or aborting, whether the after-birth is retained or not, her reproductive organs should be flushed out, because that is where the infection is developing.

B-K, the powerful non-poisonous antiseptic, is scientifically correct for this work. Used as a douche for the uterus, it quickly brings the after-birth, dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K does not cause straining, but is soothing and heals the tissues.

Send for "evidence" and free Bulletin No. 52 "Contagious Abortion." If your dealer does not have B-K send us his name

Cross or Kind Bees

BEES can be bred to develop certain characteristics of disposition, of industry, and of swarming, according to Dr. J. H. Merrill, assistant professor of entomology in the Kansas state agricultural college.

The prolific qualities of queens can also be increased by consistent breeding with that aim in view. Queens may be brought up to a production of from 4,000 to 5,000 eggs a day, and this fact is valuable in the matter of perpetuating desired characteristics. As to the development of a non-swarming tribe, I believe that the chances of doing so are in favor of it rather than against it.

Hard to Control Breeding

The difficulty in attaining desired results is in controlling the breeding. The queen may, on her wedding flight, mate with a drone from a hive exhibiting entirely different characteristics from those being worked up. This will result in a disturbance of the working out of the plan, as characteristics of habits and disposition are said to be transmitted through the male parent.

Mating between different races of bees will tend to emphasize certain characteristics which may then be further developed. The Cyprian bee, which is almost entirely yellow in color, is the crossest bee known. When mated with the Italian bee having three yellow bands about the abdomen the bees produce an Italian having an increasing number of yellow bands, and exhibiting the characteristics of the male parent. If the male parent of a golden Italian is a Cyprian, the golden Italian will be extremely cross, a disposition entirely foreign to the Italian bee.

This Is the Problem

In order to control the breeding to an even reasonably certain extent it would be necessary to buy up all bee colonies within a radius of five miles, study them in order to make sure just what kind of bees were in each, and dispose of those exhibiting undesirable traits. One can not be absolutely sure even then, for a queen in a colony at the edge of the radius may go a half mile farther and mate with an individual of opposite traits, which will at once begin to be transmited through the colony, changing it materially.

If breeding can be controlled, however, there is no reason why a colony cannot be bred up to show any desired trait.

The Grange in Washington

At the National Grange, Patrons of Husbandry, held in Syracuse, New York, in 1918, it was resolved to establish headquarters in Washington, D. C. A building has been constructed and the Grange is now in its new national home, and Thomas C. Atkinson, one of the executive committeemen, writes regarding the work of the Grange and its desire to serve its great constituency:

"The order of Patrons of Husbandry is a positive and virile force in American life. This is due to the wisdom of the founders of the order as evidenced by its growth and its numerical strength today; and their farsightedness in building the Grange upon the principles of real representative democracy. First they provided for a broad foundation in each subordinate Grange of the men and women actually engaged in the business of agriculture and home making; and then that these interests are served by actual representatives, chosen in the pure American way, constituting the state and national organizations. Thus indubitably the Grange brings to bear in the expressed views of these representative bodies on state and national questions, and its position on national legislation and administration the sound judgment reached by long and mature consideration participated in actively by the largest single constituency representative of American agriculture.

"The very 'checks and balances' which have operated to make democracy safe in America, the wonder and the admiration of the great students of the science of government, are found to be duplicated in the principles of the Grange. In actual practice its work has been found to be safe, well considered and progressive. The very method prescribed for its consideration of national and state questions prevents radicalism; yet in spite of this it has taken the great American democracy a half century to come abreast of Grange thought which declared in its earliest statements for prohibition of the liquor traffic, equal suffrage for men and women, technical education for agriculture, rural delivery of mails, the parcels post, etc.

"The opening of the Washington office of the National Grange is only a step in the modest desire of the representatives of this great constituency of American farmers and farmers' wives to more adequately serve this membership in making plain to those in more or less temporary legislative and executive authority the views of sound and progressive country thought on national problems and the reaction of the country people to governmental activities. Washington is a long way from the average American farm home; the ways of government do not run parallel to those of average country life. Men in government positions wish honestly to represent but may not know what is in the minds of those they wish to honestly represent. The opening of this office is one step in the work of making the way shorter and clearer by which the members of this order, and the true friends of agriculture, may be in closer touch with their servants in governmental positions, and thereby help make American democracy more safe and more enduring.

"Through this office, when its facilities are developed, the Grange hopes to be in close relationship, with every department of the national government which is working with the problems of rural life; as in the past it hopes also to be constantly heard on all proposed legislation affecting the business of agriculture. For these purposes it hopes to have the advice and cooperation of the agricultural press of the country as well as of all others who may be interested in these great subjects."

The snow fall of February 20 in the higher elevations of Arizona leaves an unusually heavy covering of snow over much of the range country.

GROWING STAPLE COTTON

(Continued from Page 321)

(About 1,800 pounds of seed cotton is required to produce 500 pounds or one bale of lint.)

Two feet in rows—1,650 pounds of seed cotton was produced to the acre. From cotton planted 2 1-3 feet, 1,850 pounds of seed cotton was produced, and from cotton planted March 15th to 20th, and spaced three to four feet apart, 2,012 pounds of seed cotton was produced on one acre. These results, which seem to show that wide spacing will result in high production to the acre, are commented upon by Superintendent Woods as follows:

"Cotton that is fairly wide spaced will stand more punishment than cotton which is thicker in the row. If ideal conditions were always attainable, that is if an expert cotton grower were always at hand to say just when the plants should be irrigated, and if water was immediately available when it was needed, the thicker plantings would be desirable, but with many who have had little experience, and as with nearly all farmers, water cannot be applied at a few hours' notice, I believe that the wider spacings will produce the best general results, particularly upon rather heavy soil." Mr. Woods emphasizes the very important point that no crop grown in the Salt River Valley requires so much personal judgment in cultural methods as does cotton. "No general rule," he says, "which will apply broadly can be given in the growing of cotton. All land must be thoroughly understood by the grower and the depth to the water table are factors which must be taken into consideration in order to produce a maximum crop."

Cultivation, both before and after planting, must be constant to produce successful crops. Many growers try to get over their fields every week or ten days as long as it is possible to get a horse pulling a cultivator between the rows without doing material damage. Most growers prefer shovel cultivators.

The subject of irrigation is one thing on which very little advice can be given—a question which has proved a stumbling block and a source of failure to some who have either irrigated too much or too little.

The ideal cotton ground, to some growers, is that where the water table is within two to six feet of the surface, or a sandy loam type which has been prepared in the proper manner and thoroughly saturated with water before planting requires very little water after planting, and some extraordinary yields have been obtained from land of this kind which received no water after planting. On the other hand, some of the largest yields have been obtained upon land where irrigation was necessary, that is, where the water table was so far beneath the surface that there was no sub-irrigation. The desired condition of the plant is to keep the growth constant without producing a rank "weedy" growth which will carry a large number of vegetative branches, overly large stalks and comparatively few fruit buds or bolls. The healthiest plant and the one which will produce a large amount of fruit is one where the early blossoms or bolls appear very close to the top of the plant. The experienced grower strives to obtain this condition and it is seldom necessary to begin irrigation until the first blossom appears. After this, irrigation is done at intervals or whenever the condition of the plants suggests the need of water. If the blossoms appear close to the top and there is no undue wilting of the plants, an experienced cotton grower does not irrigate. When the plants droop to a considerable extent and do not recover in the latter part of the afternoon, it is generally considered that water should be applied. A little wilting in the middle of the day and particularly after cultivation is not considered as being at all detrimental to the plants.

This matter of irrigation is a subject which must be considered and one upon which it is extremely difficult to give advice. Usually after irrigation has begun, that is, upon the land where there is no sub-irrigation, it will be necessary to apply water at rather frequent intervals and particularly after the plant is well fruited. Some successful growers on this kind of land emphasize the point that plants should not be allowed to suffer for water. On the other hand, an excess of water after the plant has been deprived of it for some time is apt to cause a serious dropping of the squares, which will, of course, result in a great loss in the cotton production. The importance of cultivation cannot be too strongly emphasized. One successful cotton grower said: "I spent my vacation making my crop; one cannot grow cotton in the mountains."

Here in the Salt River Valley growers are coming to realize more and more the necessity of having a humus content in the soil. Those who are practicing a rotation and are able to turn under alfalfa fields which have passed the maximum yield have the desired amount of humus in their land. Obviously, when one-fourth of the acreage is in cotton, a long time rotation, such as alfalfa requires, does not appeal to the majority of growers. Some experiments which have been tried out this year very successfully, and which will be practiced to a very large extent this coming year, will be the growing on each third row in the field of cow peas. These in most instances will be planted a little later than the cotton, and when they are beginning to form pods are disked back into the soil. Whether the cotton plants on either side of these decaying cow peas receive any benefit the same season is a disptued question. Some claim that the increased crop is due to the wider spacing rather than to the immediate benefits of the nitrogen gathering cow peas. This is a question for the scientists to settle, but there can be no question but that the soil for the succeeding crop will be much better.

It is pleasing to note that growers as a rule are making their plans to produce crops at a lower cost than in the past two years. This is only made possible by the growing of large crops per acre. It is conceded that cotton at present prices cannot be produced at a profit unless one produces at least the average—one-half bale to the acre. Below this there will be a loss. Therefore, the thing to do is to produce a maximum crop. It would do no harm to point out the fact that if the average were one bale to the acre instead of one-half bale, we could have produced just as much cotton on half the acreage.

From interviews with these successful growers I am thoroughly convinced that an average of one bale to the acre is possible, but it means the gradual establishment of a rotation and a most thorough preparation of the soil, intense cultivation of the crop and the best judgment of the grower in irrigation. Such crops will be profitable, even though the price should be considerably lower than at present, and with the possibility of lower prices the average or below the average crop will not be profitable.

Tractor Use, Profit, and Safety

TRUE progress is always slow. The change to mechanical power for farm work has been twelve years in the making, but today there are few American farmers who have not given serious thought to the question of tractorizing their farms.

For the benefit of those who may not yet be convinced that the tractor is a useful, profitable farm power machine, we present again a few of the opinions of farmers who are using the International Kerosene Tractor. Some of these are about essential features, and some mention only conveniences, but taking them altogether, almost any farmer will feel, after reading them, that the International 8-16 is a tractor worth considering.

"My International supplies a power flexible enough to handle the large amount of seedbed, harvest and other work without delay."

"It can be used for continuous work if emergency demands it."

"It produces power at much lower cost than horses, and it can be used for both drawbar and belt work."

"I like the steady way it works. Without seeming to hurry, it gets through a surprising amount of hard work."

"It does a lot of good work at a cost so low I could hardly believe it. You did a wonderful thing for Eastern farmers when you made this tractor to run on kerosene."

"It is not bothered by flies, nor by bumble bees. It works steadily on the hottest days."

"Requires very little care. When the day's work is done, I run the tractor tail first into an inexpensive shed. In the morning, I fill the fuel tank and the oiler, look into the radiator, and am ready for another day's work."

These opinions are typical. They prove at least that the International 8-16 is a useful, profitable tractor. Now consider just one other thought for a minute.

This tractor is the outgrowth of twelve years of active tractor experience by a company that has sold all kinds of farm machines for many years. The beginning of this business goes back to 1831—almost 88 years ago. Does it not seem reasonable that with this experience we should offer you a tractor that you could use with profit, especially when we expect to come back some day and sell you more of the machines listed in this advertisement?

If you are now convinced that the International 8-16 is a useful, profitable tractor on some farms, and that you don't have to be an expert to buy one safely, write us to find out what this tractor will do for you, on your farm. A post card will bring you full information.

POULTRY

OUR SPECIALTY
GUARANTEED TRAP NESTED
S. C. WHITE LEGHORNS

It's our business to improve egg production for you. We have the stock planned for your success. We hatch our own eggs and sell chicks and eggs from our own hens only. We have 1500 chicks yet to sell for middle of March, otherwise we are all sold out. Hatching eggs from our high record hens at $5.00 and $10.00 per 15. Write us for prices on second season hens and yearling cock birds for April first delivery. These males are all bred from 200-egg hens or better and by hatching from them in May and June you will get eggs next December. If you really want the best in Leghorns, let us hear from you. ENGLANDS EGG RANCH. The home of "ACTUALLY" trapnested S. C. White Leghorns every day in the year since 1912. Box B 337, Inglewood, California.

Baby Chicks, Hatching Eggs, Breeding Males. Barred Rock, Ancona, R. I. Red, Black Minorcas, White Minorcas, White Orpingtons, Black Orpingtons, Light Brahmas, Buff Leghorns, Brown Leghorns and Macfariane White Leghorns, CHICKS and EGGS. Duck, Geese, Turkey eggs. Circular free. POULTRYMEN'S COOPERATIVE HATCHERY, D. E. Doke, Mgr., 732 S. Spring, Los Angeles.

White Leghorns are the most profitable breed of poultry. If you are in the business for profit you will eventually have them. Early broilers; early payers; early PROFITS. We sell only WHITE LEGHORN BABY CHIX from heavy laying HOGANIZED hens. Safe delivery of full count live chix guaranteed. Prices per 100: February, $15; March, $14; April, $12.50. The Pioneer Hatchery, 409 Sixth Street, Petaluma, California.

S. C. White Leghorn Setting Eggs from the Sunny Slope Poultry Ranch is sufficient to warrant quality of production. We will sell setting eggs only during 1919. If you want birds that will produce quality and quantity, place your orders with us. You will then ever be a satisfied customer. Sunny Slope Poultry Ranch, Longden Ave., Box 789, San Gabriel, California.

Barred Plymouth Rocks—Champion prize winners and wonderful layers. Choice cockerels, hens and pullets for sale. Eggs for hatching from grand matings. I have made a specialty of Barred Rocks for twenty years. That's why our birds win at all the leading shows. "Nothing better in poultry" than Vodden's Barred Rocks. Catalog free. Charles H. Vodden, Los Gatos, California.

Hatching Eggs—White Leghorns, Light Brown Leghorns, Dark Brown Leghorns, White Rocks, $2.50 per 15; $10.00 per 100. All bred to highest possible standard of beauty and utility. Mahajo Farm, P. O. Box 597, Sacramento, California.

R. I. Red Chix or hatching eggs from first class Hoganized utility stock, prices no higher than ordinary stock. Chix and eggs from prize winning Buff Orpingtons, quality rather than quantity our motto. Munier Poultry Yards and Hatchery, Cupertino, California.

Baby Chicks Every Week. Order early and get the date you want. White and Brown Leghorns, Rhode Island Reds, Barred Rocks, Anconas; also hatching eggs. Safe delivery guaranteed. Write for circular. Stubbe Poultry Ranch, Box 67, Palo Alto.

A Social Help

Let's suppose it's a church or school social—or a Red Cross rally—or a "get-together" meeting of the Farm Bureau—or what not—

Will Ghirardelli's be there? What a question! For this delicious, appealing food-beverage is *always* in order at any social function. It means cheer and comfort and warmth! It provides a social help that no hostess (whether she has in mind a "big affair" or a "little party") can afford to overlook.

In ½ lb., 1 lb. and 3 lb. cans—at the store where you do your trading.

Say "Gear-ar-delly"

D. GHIRARDELLI CO.

Since 1852 San Francisco

Ghirardelli's Ground Chocolate

A PRAYER IN TIME OF PEACE

Remembering how our tortured hearts
Turned unto Thee in time of war,
For help to bear its blistering smarts,
Its fears, its tears, its shifting score,
Dear Lord our God, let us not cease
To pray to Thee in time of peace.

Give to the eyes that wept and wept
A clearer vision for their tears.
Grant to the hearts all passion-swept,
A manlier courage for their fears.
Let feet that through the depths have trod
Learn to walk humbly with Thee, God.

Out of the foulness let us bring
Clean hands that hold life's standard high,
Souls that will brook no bargaining
With greed or lust, deceit or lie.
Ears deafened by war's murderous din
Make Thou to hear the Voice within.

Let us forbear to strut and boast
Because of triumphs we have won,
Remembering the valiant host
That died or ever we'd begun.
O Lord, protect us from the shame
Of thinking we are free from blame.

Let the great hour that now has struck
Wake a great echo in our breasts,
Let us, each one, with joyful pluck
Turn to the task that with him rests.
Lord, may it not have dawned in vain,
This day of peace Thou didst ordain.
—Julia M. Lippman in Good Housekeeping.

JUGO-SLAV AND CZECHO-SLOVAK

By Constance Winifred Stumpe, in Red Cross Bulletin.

JUGOSLAVIA, Czechoslovakia—new names on the lips of the world. What are they? and where? Let us imagine ourselves skimming in a swift plane, along the shores of the blue Adriatic, as far west as the river Save, which bounds Carniola and Croatia, and the river Drave, which bounds Slavonia—from Trieste to the Greek frontier, hovering over the western Balkans and portions of Macedonia. Here lies Jugoslavia, the federation of the southern Slavs ("jugo"—south). Below us lies a rugged mountainous country, with fertile strips of meadow and farmland running down to the sea, embracing 18 different political divisions, inhabited by a homogeneous and loyal people, united today for the first time under one government. There to the north, tucked in the Bosnian hills, lies Serajevo, where in June, 1914, the tragic assassination of the Austrian archduke flung the spark in the tinder-box of Europe. Innocent enough it looks, this little city, with its crooked streets and half-oriental aspect, under the frowning panorama of the hills.

Serbia, with whom the world has become intimately acqpainted during the last four years, is the most important of the Jugo-slav states. Her story is one long tragedy, and the story of Serbia is the story of the Balkans, the story of the Jugoslavs. The people of this corner of the earth have been harassed from all sides by the Romans, by the Turks, whose victory at Kossovo (1389) extinguished the independence of the Serbs for four hundred years, by the Austrians, who have played chess with them in preserving what kings have been pleased to call "the balance of power." But the Serbs, fighting down the centuries, have remained unconquered in spirit, striving always for their own freedom and in this they have been more fortunate than their brother neighbors, for the treaty of Berlin of 1878 fixed the boundaries of Serbia and Montenegro and made of them autonomous states.

Serbia's plucky stand in the war is an old story. Of the army of 250,000 that began the great retreat of 1915, 100,000 perished in the campaigns through the snow filled passes of Montenegro and Albania. Serbia was laid waste. Two hundred thousand Serb women and children straggled over the hills, while their men fought desperately, though vainly, against the enemy pressing down from the north. And there was snow, and freezing cold and famine and death. Thousands perished by the wayside. The remainder reached Monastir, the last Serbian outpost, on the Macedonian frontier, where the kindly hand of the Red Cross has done its pitifully small utmost to feed them, clothe them and dispel their terror, if only for a moment.

Religious differences have played their part in the Balkan question. The Jugo-slavs had been early converted to Christianity, but unfortunately, they were not all to gain salvation by the same process, those living east of the diocesan line, when the church, in the eleventh century divided these lands between the jurisdiction of Rome and that of Constantinople, becoming Greek orthodox, and those west, Roman Catholic. Men, in the false interpretation of their beliefs, have made religion a burden, a handicap, rather than a key to higher spiritual achievement and the science of living well. So with the Slavs of the Balkans. Bigoted, narrow, superstitious, though devout enough in their own way, living in the wrath of God instead of in His love, their varying and conflicting religious faiths have proved as subtle and potent a weapon in the hands of their oppressors as politics. Austria was able to keep her hold on Bosnia and Herzegovina, which she annexed in 1908, by making appeal to the Roman Catholics.

But the national spirit smoldered. When the guns screamed their challenge across the world in 1914, the representatives of "pan-Jugoslavia," were scattered among various lands. They knew the hour had come and lost no time in organizing their resources outside of Jugoslavia and in inciting the spirit of revolution among the Jugoslavs forced to fight under the flags of their conquerors. Jugoslavs all over the world, and there were not a few of them in the United States, rallied as at the sound of a long awaited summons, to fight for their freedom. A regiment fought valiantly with the Italians along the Piave. Their objective is the foundation of a constitutional and limited monarchy whose sovereign shall be "king of the Serbs, Croats and Slovenes," the three principal divisions of the Jugoslav peoples.

The story of Czechoslovakia is similar in that it tells of a long oppressed people living under Austrian domination who have at last, under an able champion, risen to the dignity of freedom in establishing the autonomous republic of Czechoslovakia, with the old and beautiful city of Prague as its capital. It lies in that northwestern corner of Austria next the German frontier, embracing Bohemia and Moravia—a romantic country, with a long and stirring past covering a thousand years of struggle. To even touch the high light of Czech history were to print a volume. A progressive and prosperous state in the Middle Ages, the Thirty Years war (1618-1648), reduced Bohemia to complete subjection under Austria. The Czech nobility was decimated by execution; Czech language was forbidden; Catholicism was forced upon a

people that had been staunchly Protestant since the days of John Huss, all those that did not bow to the absolutism of the church being persecuted and driven from the land.

But fire and sword and blood and tears can not break the spirit of freedom. Like their neighbors to the south, the Czechs and the Slovaks awaited the "day." The world is familiar with the achievements of the Czecho-Slovak legions, recruited from every corner of the earth. Czechoslovakia has been recognized by the great powers, and her first president, Thomas G. Masaryk, a Moravian by birth, has already taken up his duties.

And so order rises out of the chaos and oppression frees itself from the lash of hate. All power to the new born nations; may their peoples find happiness and prosperity in their new federation and may their progress mark a new era in the evolution of mankind towards greater destinies, bringing peace at last to the troubled Balkans and joy to the hearthfires of those who have suffered greatly for freedom's sake.

SOME ANONYMOUS COMMENT

Here is one anonymous sister who has often been moved to write to the Cultivator, but failed to do so, for good reasons. But I've read all the Cultivator recipes—cut them all out, and used many of them—with eliminations and reservations. You all should see me smile over some "economical" recipes. Why, dears, you don't know what it is!

In the "gems" or "muffins," I eliminate the fats, the sweets, and the eggs. And so on with all of them. Johnny cake—instead of the regulation 2 cups meal to 1 of flour I used 3 cups of meal, and no fats nor sweets, nor egg, nor milk—just baking powder and water. I feel proud of my soup. It is a most elastic recipe, expanding or shrinking according to the available "makin's."

Fry a bacon rind if you have a piece of it, and boil it. Fry an onion, if you have plenty, or a piece of one, if not, and add to the kettle. If you have no onions (too often the case, alas), use a piece of clean onion peeling which you have saved for this very purpose, and boil it with the soup, removing it before serving. To the kettle add a little pinch of celery seed which you happen to have, also a sprinkle of clove; pepper, both red and black, and salt. If you have a tomato or so, or a smitch of boiled rice, or most any old thing, add it to the soup, but try to save a bit of it for next day. For crackers in the soup, use the bread crumbs—even every crumb that falls from the slicing must be saved for this. (That is why I can't keep a hen—no crumbs to spare for her.) If you have a potato or two that can be spared for soup, pare and slice and add them also to the boiling soup, or a sprig of mustard, or a piece of cabbage leaf, or stump I add if I have it, which usually I do not.

If making anything in the bread, cake or pancake line which needs egg, add a bit of cornstarch instead. Use water when recipe calls for milk. If it is sour milk needed, add a little vinegar if you have any. If not, mix up a little flour (most any kind) with a little warm water, and keep in a warm (not hot) place till sour. A "speck" of yeast, bits of dough or batter, beaten into this, helps matters on a bit. Now I don't know whether the Cultivator would care to publish this, or not. It can do just as it pleases. But if it is—my name is not to be made public. Nor do I wish this to be returned; the waste basket is good enough.

SOME GOOD RECIPES FROM NEW MEXICO

By H. G. Willing

Cheap, Quick and Sure Mock Angel-food Cake

1½ cups flour, 1 cup sugar, ¼ teaspoon salt, 4 level teaspoons baking powder. Put these in sifter and sift 5 times. Add 1 cup scalding hot milk gradually to dry ingredients and stir until smooth, add 1 teaspoon vanilla extract. Fold in stiffly beaten whites of two eggs and turn into ungreased loaf pan, small size. Bake in moderate oven 40 minutes.

For chocolate frosting sufficient for this: 1 square chocolate (unsweetened), ⅜ cup sugar, 1 pinch salt, 1 tablespoon milk, ½ teaspoon vanilla extract, 2 egg yolks. To make: Melt chocolate, add sugar, salt and milk and cook till smooth, then egg yolks and vanilla and cook one minute. Then apply.

For practical helps in any housekeeping problem, cooking, cleaning, sewing, etc., the Cultivator will credit subscription of sender. With contribution please send name and address of the one to whom the paper is to be sent.

Best Pancakes Ever—Quick Breakfast

Using level measure. 1 cup Graham flour, 1 cup corn flour, 1 teaspoon salt, 4 teaspoons baking powder, 1 cup milk or enough for right consistency, or ½ teaspoon soda, 1½ cup sour milk, 1 teaspoon baking powder, 1 egg.

For syrup, cook sugar with water and a little molasses, flavor with vanilla. This resembles maple.

Easy Biscuits

2 cups white flour. 4 teaspoons baking powder (level), 1 teaspoon salt. Sift these and rub in as much shortening as a teaspoon can carry heaped and cold. Add 1 cup milk and stir. Do not roll. Shape quickly with fingers and place on a buttered pan, just moist enough to hold together and bake 12 to 15 minutes in a hot oven.

SAVE THIS TILL GRAPE SEASON

"The following simple method for making syrup from grapes is much used in Southern Italy and can be employed in California just as well," says the Placer County Farm Bureau Weekly. "This syrup can be made in any kitchen and is suitable to be used with hot cakes, cooking and other purposes for which corn syrups are used. It is much superior to most of the syrups at present on the market."

The grapes are stemmed, crushed and then heated to nearly the boiling point for a few minutes. The juice is then strained off, through a muslin bag in the usual way, and placed in a wide shallow pan on the stove. Egg shells are put in with the juice to neutralize certain of the acids—say about a dozen egg shells to the gallon of juice. Or prepared chalk (from the drug store may be used instead of the egg shells)—about 1½ to 2 ounces to the gallon.

The juice is then kept boiling slowly until it thickens to a syrup of the desired consistency. It is then again strained through a bag and kept in jars.

THE ETERNAL GAME

"Why is it that some men can't stand prosperity?"

"Because," replied Mr. Dustin Stax, "so many of us are inclined to forget our own and try to take somebody else's away from him.

Home!

And the savory fragrance of *real* home-cooking calls to him that *mother's in the kitchen*

Her kitchen is every home-making woman's delight, and the woman who owns a modern Majestic range knows how wholly delightful a kitchen can be.

Nothing adds more to your success and pleasure in cooking, nothing is a source of greater pride and joyful satisfaction to you, than the appearances of your kitchen.

The Majestic is a *beautiful* range!

Picture a Majestic in your kitchen. See its gleaming, shimmering, sanitary trimmings of nickel, smooth as glass, almost mirror-like in polish. You'll never need to black the cooking top of your Majestic—for it is *burnished* a rich dark blue, a genuine permanent *deep-color burnish* as lasting as it is beautiful. The Majestic range-frame is *unbreakable*, made of *malleable iron*; the body is of rust-resisting 99% pure charcoal iron—*durable*, and with all the charm of high *natural* finish.

But to realize the supreme beauty and solid worth of the Great Majestic *home* range, you must *see* it. There is a Majestic dealer in every county in 42 states.

Let *your* Majestic dealer show you the several Majestic styles. He will explain the convenient water-heating arrangements; the fuel economy and perfect baking that result from the cold-riveted heat-tight construction—and many other Majestic features.

Belgian hares, 16.

LIVE STOCK

By F. P. Allen, Bureau of Markets, Los Angeles

The receipts of finished steers gradually diminish as the hay fed cattle season advances, the bulk of the supply consisting of half fed steers. High feed prices are mainly responsible and the producer seems to figure that the price he receives for half fed cattle is a better return than to finish them at the present top market price. Steers of good quality find a ready market and a premium is paid when the quality justifies. Cows are in active demand and prices are firm for all grades.

The future of the hog market is an unsolved puzzle to both producers and killers. The present government contracts in the Eastern markets, for export hogs, have their effect on the local market to a great extent. The burning question is, will new contracts for foreign shipment of pork be made upon the expiration of present contracts. Local killers of hogs have maintained the agreed to price for No. 1 hogs throughout February and present prices are still at that level even in the face of the fact that the market for dressed hogs is in a weakened condition caused by a poor demand from the consumer.

Choice lambs are fully steady but all other grades have a weak undertone. The supply of them is a little in excess of the demand. Yearlings are in good demand. Wethers are very scarce and the market is strong. Ewes are weak owing to the extremely light demand.

HAY

Under date of March 1, Scott-Magner & Miller says:

Receipts past week 1228 tons, last week 1662 tons, and the week preceding 1398 tons. The falling off no doubt was caused by inclemency of the weather throughout the state during the greater part of the week. At present time the country crop conditions are encouraging. Owing to the continued wet weather there has practically been no hay market held during the week, dealers refusing to go down to the hay yards when it is so muddy and wet, preferring to work on stocks on hand until things are dry underfoot Therefore, prices quoted are simply nominal and trading is done on former quotations.

The main item of interest during the week was the call by the government for prices on 900 tons of double compressed hay for shipment to Manila. This without doubt will be awarded to San Francisco bidders. It is rumored that the government will soon be in the market for a round lot of hay for their various cantonments.

The unsettled condition of the grain market is reflected by the hay demand—buyers holding back and purchasing only from hand to mouth.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market—for prices to consumers, charges of cartage, commission and handling expenses must be added according to conditions:

Fy. wheat hay (lt. 5 wire bale).24.00@25.00
No. 1 wheat or wheat-oat hay.22.00@23.00
No. 2 wheat or wheat-oat hay.16.00@20.00
Choice tame oat hay.....21.00@23.50
Other tame oat hay.....16.00@19.00
Wild oat hay .....16.00@18.00
Barley hay .....16.00@18.00
Alfalfa hay .....16.00@19.00
Stock hay (in order).....14.00@17.00
No. 1 barley straw (bale)..... .50@ .80
Damaged hay (all kinds), according to quality.

GRAIN

Barley: Feed, 1.85@1.90 per cental; shipping, nominal at 1.95@2.05.

Oats: Red feed, 2.05@2.20 per cental; seed, do, 2.50@2.75; recleaned, 3.00@3.10.

Corn: California yellow 2.52½@2.75 per cental: Egyptian, 2.80@3.25 for dry and 2.50@2.75 for rain damaged. Milo maize, 2.75@2.90 for dry and 2.40@2.50 for rain damaged.

Wheat—Following are net weight prices for bulk grain based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Cental
No. 1	2.20	$3.62 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58½
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48½

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran, 42.00; shorts, 42.00; middlings, 42.00; rolled barley, 48.00 @50.00; alfalfa, 32.00@34; scratch feed, 3.75 per cental.

Citrus Fruit Market

Los Angeles, Cal., March 5, 1919.

With still about 8000 cars of navels yet to go, the market is looking exceptionally attractive; $5.00 to $6.00 sales are common and some sales have gone well towards the $7.00 mark.

Lemons are not so attractive. Occasional sales of poor stuff have gone below the $2.00 mark. Good stock, however, is commanding fair prices and limited shipments are being made.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 8401 cars, lemons 2347, total 10,748. To same date last season; oranges 4331, lemons 1157, total 5.488. Central California this season; oranges 2949 lemons 337, total 3286. Last season to same date; oranges 1895, lemons 107, total 2002. Northern California; oranges 244, lem. 2. Last year same date, 202.

March 4

New York: 13 oranges, 8 lem. Nav. 4.75-6.60, Ruby bloods. 5.75-6.85, lem. 2.20-4.25.

Boston: 5 oranges, 1 lem. Nav. 3.85-6.05.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

From post card reports to Los Angeles branch of the bureau of markets, report is made of the following shipment of cars of products from California for the week ending March 3: Apples, 39; artichokes, 1; cabbage, 70; cauliflower, 106; celery 32; dried apples, 10; dried apricots, 2; dry beans, 56; dried figs, 1; dried peaches, 18; dry peppers, 1; dried prunes, 20; lettuce, 115; mixed vegetables, 105; mixed fruit and vegetables, 15; mixed dried fruit, 8; onions, 30; pears, 2; potatoes, 54; raisons, 73; spinach, 18; squash, 2; sweet potatoes, 1; Mexican tomatoes, 29; turnips, 1.

MARKET NOTES

The San Fernando district is making its maiden effort in the production of cabbage. From observations made by field men connected with the bureau of crop estimates the outlook for Winningstadt is not very promising. It is yielding only four to five tons per acre and apparently not adaptable to this particular section, however, 60 per cent of the acreage which is of the cannon ball variety is in good condition with a probable yield of 10 to 11 tons per acre. Shipments of this variety will start about March 20.

After investigations as to cantaloupe conditions in the Imperial Valley R. G. Risser reports: "The acreage is as large as was ever planted, and the present prospects are for record breaking shipments in the Imperial district. The new districts in Los Angeles and Riverside Counties will probably make important commercial shipments later in the season.'

Imperial Valley's cantaloupe acreage is divided about as follows: Calexico, 160 acres, Heber 2205, Imperial 624, Grape 367, Brawley 6313, Rockwood 595, Poppy 843, Westmoreland 1983 acres.

Imperial Valley lettuce has been developing slowly and heads are smaller than in former seasons.

Thermal, Riverside County, reports onions as growing nicely and showing a condition of about 90 per cent.

The Imperial Valley and San Pedro hills in Los Angeles are shipping peas in express lots to Eastern markets. The planting in Imperial is about 738 acres, in the San Pedro hills, 550.

Florida strawberry shipments have been lighter than usual because of shortage of transportation, labor and fertilizer. A very few express shipments are made at 75 cents per quart.

Imperial and Los Angeles Counties will begin the shipping of tomatoes the latter part of May.

Imperial Valley will plant about 1035 acres of watermelons.

Fullerton, Orange County, has made liberal planting of potatoes, but owing to the failure of last year's crop it is predicted the total will not reach that of former years.

The Kansas City stockyards reports great increase in the demand for manures. This season's shipments during the month of January aggregated 253 cars, while in January, 1918, there were only 16 cars shipped out. Most of the supply goes to truck farmers.

The trade anticipated a great decrease in the supply of hogs at the Kansas City yards, but the receipts during February ran much heavier than during the months of December and January.

Reports as to the area planted to onions in the Stockton district indicate less acreage than last year. The onion districts of Texas show a condition of about 85 per cent. The market is much more active than for some weeks.

Potato values the country over are dropping much lower than anticipated. Northern California potato sections are reporting prices around $1.00 per hundred pounds. Stockton, however, reports some fancy stock still commanding $1.75 to $1.90.

WEATHER CONDITIONS

Top Dressing Talks

Deciduous Orchards. Run-down deciduous orchards may be greatly benefited by the application of 100 pounds of ARCADIAN Sulphate of Ammonia per acre about four weeks before the blossoming period. Where the soil has lost most of its nitrogen 200 pounds may be added with most beneficial results.

Truck Crops. Beets, peas, beans, lettuce and similar crops are all heavy nitrogen feeders, especially when being forced for the early market. Broadcast 100 pounds or more of Arcadian per acre when seeding or shortly before, and harrow in.

Lawns and Pastures. On an established sod, 100 pounds per acre will promote growth and vigor. The application should be made when the grass is dry, for if wet, the Sulphate will adhere to the leaves and burn them. An irrigation soon afterwards, however, is very beneficial.

Arcadian Sulphate of Ammonia

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in U. S. A. Arcadian is The great American Ammoniate.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste — (Atomic Sulphur) — and for dusting.

For Lime Sulphur Solution, use our DIAMOND "S" BRAND refined Flour Sulphur. We can furnish you this sulphur at such a low price that it will pay you to mix your own solution.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our Diamond "S" Brand Powdered Sulphur. Write direct to

San Francisco Sulphur Co.

624 California Street, San Francisco, Cal.

We are equipped to make immediate shipment. Send for illustrated booklet; price list and samples, and please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Tel. Kearny 871.

Get Your *Irrigated* Farm From the Canadian Pacific

IN a climate not excelled by any agricultural area in America you can own a fine, rich farm of your own. The Canadian Pacific Railway offers you this opportunity to achieve independence and grow rich—in Western Canada. The lands offered are in the largest and most substantial irrigation undertaking in the Continent. The price is only $50 an acre—some for less.

Twenty Years to Pay
You pay down 10% and have 20 years in which to pay the remainder. The first crop is often worth more than the total cost of the lands.

$2,000 Loaned to Farmer
Loans of $2,000 in improvements are made to approved settlers on irrigated farms with no security except the land itself. You can take 20 years to repay this loan at 6% interest.

Irrigation, Crop Insurance
This land is not arid but production can be greatly increased by irrigation. There is an unfailing supply of water which is administered under the direction of the Canadian Government. The provinces have no control over it and there is no conflict of law or authority over its use. The water is free, the only charge being a fee of from 50c to $1.25 per acre for the maintenance of the system and the delivery of the water. Irrigation here is *not* an experiment.

Why an *Irrigated* Farm?
Because irrigation in Southern Alberta
—insures crops every year
—increases crops every year
—makes you practically independent of weather conditions
—produces great quantities of coarse grains, pasture, alfalfa, roots, thus developing the live stock industry which is safer and ultimately more profitable than wheat farming
—tends toward close settlement, well cultivated farms, good neighbors, good roads, schools, churches, telephones, mail delivery, co-operative marketing, and a high standard of community life.

The Opportunity for You
The Canadian Pacific Railway knows that its prosperity depends on the prosperity of the settlers along its lines. Because it wants good settlers it is willing to sell its lands at these remarkable prices and terms.

Send for special railway rates and special booklet fully describing all lands and giving all details.

Waste Beans as Poultry Food

Written for California Cultivator · By E. Ralph de Ong

THE great need in the food of either man or beast is protein, that is nitrogenous material. Our first great source of supply is of animal origin, either meat or dairy supplies, all of which are very expensive. The second and cheaper source is from plants which contain a high percentage of protein, especially the legumes such as beans and peas.

The poultry keeper is compelled to feed his growing stock and laying hens large quantities of nitrogenous food, if he expects to succeed. If a cheap supply of this kind of food, such as buttermilk or skim milk, is not available to the poultry man, then he must resort to blood meal, meat or fish meal at a price of four to eight cents a pound to supply the deficiency. Alfalfa meal is sometimes used in poultry foods as a cheap nitrogenous food, but the amount which the hen will consume is limited.

A cheap substitute for the high priced meat meals them is what interests the poultryman, and here is where the waste bean may supply the need. The following table shows the relative value of the bean as a food compared with other common sources of protein for poultry feed. It will be noticed that beans stand at the head of the list, so far as the total food value is concerned, it having a total percentage of 74 per cent as against 23 per cent for fresh bone. The expensive element protein ranges from 18 to 26 per cent for beans with an average of 22 per cent. In meat products it is from 69 per cent in blood meal to 18 per cent in bone. Comparing the cost of the foods the price of protein in blood meal at six to eight cents a pound would be practically the same as the cost of this substance in beans at three to four cents per pound.

Comparative Feeding Value of Beans and Meat Products

	Protein Pct.	Carbohydrate Pct.	Fat Pct.	Total
Beans	18 26	54	.8	74
Dried blood	69	..	.9	70
Fish meal	38	..	8 0	46
Fish meal	27	..	11 0	38
Fresh bone	18	..	5 0	23

When the amount of carbohydrates and fat is considered in the bean, in addition to the amount of protein present, it will be seen that this is a very valuable food.

Beans alone are a richer food than is necessary to feed poultry. The most economical use of this material will be as a supplement to grain and mill feeds. Ground it may be incorporated into the dry mash to 10 or 15 per cent of the entire amount. In other words, use it about the way oil meal is commonly mixed into the dry mash. Poultry will not eat the dry, whole bean so that it is necessary to either cook them or have them ground to the same fineness as coarse meal. For the small flock, cooking with the addition of a little salt is the better way of making them palatable, allowing about one-fourth of a pound of beans daily to 12 or 15 hens.

There are two sources of waste beans in this state; beans which are split in the process of threshing and those which have been damaged by rain or injured by bean weevil or other insects. Stock of this kind often accumulates at the warehouses, particularly where they are doing cleaning work. Some of the larger supply stores also carry this class of beans, wherever the demand warrants it. The price on ton lots usually ranges from $40 to $50 a ton, depending on the condition of the bean and the amount of trash present. On small lots the price varies from three to four cents a pound. Any variety of bean or pea may be used for this type of feeding. There is of course some variation in different varieties but all are valuable.

Meat Makes Eggs

My experience with my chickens this winter has been so satisfactory that I felt it might be of interest to other owners of town lot flocks. I moved them to town the middle of July. They had been on free range and were not laying very many eggs. I had 13 hens and a rooster, all pure bred R. I. Reds, two years old next month.

I have been raising chickens for several years and in common with others found it a problem the last two years to secure the best and cheapest feeds. I found it more of a problem with chickens in a small yard than when they had the run of a 15 acre farm.

I first tried one of the best of the commercial mashes with greens and milo as a grain, but the results were only fair.

The bread winner of the family took charge of a meat market and began to save the bits of meat which were not salable, such as the block scrapings and dark pieces which had to be trimmed from the steaks and roasts. In the course of a day he fills a quart box and these I cut up, and feed raw, being careful that none of it is spoiled. In a very short time the hens began to lay and all fall and winter the neighbors envied me my hens.

I fed milo morning and evening, no mash, but let them run in the outside yard and a vacant lot next to us for an hour each evening so they could choose their own greens. They were taught to come when I called, so with a handful of grain I can soon yard them when they threaten to invade the neighbor's garden.

I regret that no account was kept of the number of eggs. It has been no uncommon thing to get 12 eggs a day from the 13 hens though never two days in succession. We expected them to stop to moult, but except that I found feathers under the roosts one could not tell whether they moulted or not.

I was afraid that so much meat might cause sickness but haven't had a sick hen. Sometimes I have seen a tendency to loose bowels but cutting down on the meat for a few days soon remedies this.

This method of feeding may not seem to be a scientific one, but has certainly given results.

My neighbor thinks it is the breed of hens and plans to have some of them next year, but last year, which was their pullet year, they were fed grain and a mash and were on range and I got no such results as this year.—Mrs. E. M. Bradley, Santa Ana.

Unfortunately few people have access to such a liberal supply of meat, and if purchased, even at the low price which the butchers charge for these meat scraps and bone scraps all

THE SPECIALTY DEVICE CO.
Dep't 47 106 West 3rd Street Cincinnati, O.

THE SELF-OILING WINDMILL
has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year.

Double Gears are used, each carrying half the load.
We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

ground together, it still could hardly be made such exclusive diet, we mean within the bounds of economy. But these ground bone scraps are well worth liberal using. We believe that practically every butcher now saves these wastes and in the grinders which they install they are made into the most satisfactory part of the meat ration of many near-town poultry yards.

THIRD ALL NORTHWEST LAYING CONTEST

By Jean A. Koethen

The reports from this contest, which began at Pullman, Washington, November 5, 1918, are always interesting. The latest, which gives results of the contest for the three months ending January 31, is added proof, if such proof were needed, of the superiority of certain standard breeds in the matter of egg production.

We are not told just how many breeds are competing, but the breed honor roll of high pens in each breed includes three pens each of White Leghorns, Rhode Island Reds, Rhode Island Whites, Barred Rocks, Black Minorcas and White Wyandottes, with a single pen each, classed as "miscellaneous," of Anconas, White Rocks and Buff Orpingtons. As usual, White Leghorns lead, their high pen records being 339, 337 and 296 eggs for the three months. It is understood that each pen contains five hens, but in some cases in these contests there have been six in a pen. Next to Leghorns, though placed at the bottom of the list because two of the three pens are from the Washington State College, and therefore not in the competition, come White Wyandottes, with 303, 245 and 244 eggs respectively. Rhode Island Reds scored 295, 255 and 189; Rhode Island Whites 239, 220 and 131; Barred Rocks, 182, 147 and 123; Black Minorcas, 156, 113 and 109. From these figures it appears that Rhode Island Reds laid nearly 100 per cent more eggs and Rhode Island Whites nearly 30 per cent more than Minorcas, while Leghorns were so far ahead that one could only see the dust they raised.

Among the high hens on the honor roll, White Leghorns led, of course, the best layer producing 74 eggs in the three months, or an average of almost 25 eggs per month. The other Leghorns produced respectively, 73 and 70 eggs, three hens having the honor of laying 70 each. The only other hen in the competition that reached 70 eggs was a Rhode Island White, but Rhode Island Reds averaged a little better than the Whites, the average of the three highest Reds being 65 1-3 eggs, while that of the four highest Whites was 61¾. The three highest Wyandottes laid 66, 65 and 65 eggs, an average identical with that of the Reds. The three highest Minorcas averaged 42, and the three highest Barred Rocks 51 eggs each.

HENS OR CAPONS?

Oregon tells us that the total annual loss due to keeping cockerels with flocks is $630,427. If this is true in the north, California might find the loss just as great. To caponize the rooster may prove the real antidote for the trouble; by this simple operation, we change something worthless into profit; a great expense and waste to abundance.

Of all the meat produced from animals and fowls, capon meat is considered of the best.

Every back yard flock can have as many capons as hens, and all can be housed and fed together without noise or fighting. One or more capons can be taught to hover baby chicks and "Aunt Dorkin" can go back to laying; a capon will take better care of the chicks and will stay with them as long as they will stay with him.

The cockerels should be caponized when comb and wattles begin to show red; in heavy breeds this will be when they are about eight weeks old.—Mrs. H. Ament.

Get Big Crops With Less Effort

The long levers on Disc Harrows make gang shifting easy. Not only is handling easier but the work is better. The E-B Disc Harrow is quickly and easily adjusted and has great flexibility and increased penetration. This insures thorough pulverization of the soil, better seed bed, larger yield.

E-B Disc Harrows

The E-B Disc Harrow is a modern necessity for the man who wants big results and all the crop profits he's entitled to. Powerful and dependable, this disc harrow will give you years of satisfactory service. Have your dealer give you full details of this harrow.

POLSON IMPLEMENT COMPANY, Seattle, Wash.
WALLACE CORCORAN COMPANY, Portland, Ore.
H. C. SHAW COMPANY, Stockton, Calif.
DIXON & GRISWOLD, Los Angeles, Calif.

THE E-B LINE

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler
of the "Giant" Type
WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

YOU SHOULD
send for our LATEST catalog J-600 which is full of interesting information on LABOR SAVING DEVICES and machines for moving the earth.

Schmeiser Manufacturing Company
22 Mechanic St. Davis, Cal.

Manufacturers of
Sure Pop Almond Hullers and Separators, 3 sizes; McGarvin Fruit and Olive Graders, any size; Schandoney & Harrington Equalizing Hitches, any size; Diamond Special Harrows, Baker Clips, Clevises, and Schmeiser Portable Automatic Hay Derrick. We sell the Martin Ditcher and Grader.

Disc Harrows

THE ARNOTT DOUBLE DISC HARROW

We have nine distinct styles of Disc Harrows. A Harrow for every use. 3 feet to 12 feet in width of cut. 14 to 20 inch discs, solid or cutaway. No assortment so complete. Call and see them or write for catalogue. We are headquarters.

FIELD HARROW 4 TO 12 FT. WIDTH

ARNOTT & CO., Inc., 112-18 S Los Angeles St., Los Angeles

The difference between tires is comparatively slight—*to the eye*

AS LITTLE difference as there is in the appearance of eggs, unless you know how to detect the good ones.

BUT NOWADAYS you don't need to buy tires on hope—not Fisk Tires, because you have the happy experiences of hundreds of thousands of contented users to serve as your own personal buying guide.

MORE THAN THAT—the reputation of one of this country's largest manufacturers for a product of the highest quality is back of every Fisk Tire made.

A SPECIAL FISK FEATURE you do see, though, is the scientifically designed non-skid tread of deep, wide-faced, sharp-edged buttons, so distributed on the traction surface that you are assured of a firm grip on the road for the pull forward and are fortified against side-slipping in any direction.

THIS TESTED SAFETY, combined with long mileage, economy and established Fisk Quality make Fisk Non-Skids as attractive a tire investment as you can buy anywhere.

"There is now a Fisk Tire for every motor vehicle that rolls"

New Mitchell Sixes

Wheelbase 120 inches
Long-stroke Six motor
Cylinders 3¼ x 5
Tires 34 x 4

A Completely New Six

Over 100 New Standards---75% More Endurance

The war has enabled us to do in 18 months what we might have spent years to accomplish. The great Mitchell factory was given to truck building. Our engineers and specialists had 18 months to bring out a new Mitchell, built to new standards.

The result is that now we are able to offer our new conception of a lasting Six. There are more than 100 improvements, 50 per cent added strength, 75 per cent more endurance, 25 per cent more economy and 20 per cent greater beauty and comfort.

It Had to Come

Two years ago we decided, for our part, that the Light Six type should be bettered. It had been too light. Experience had shown that the boasted over-strength was too often under-strength.

Fierce price competition had forced makers to skimp. Then ideas were changing. Buyers bought their cars to keep, and they looked for many years of service.

The Mitchell was great and successful. In 14 years it had won a world-wide fame. But we knew that all Light Sixes, including the Mitchell, must adopt new standards to meet new-day expectations. And we started then to make our preparations.

New Specialists

We added to the Mitchell staff many new specialists. These were men who had made their mark in high-grade car construction.

Then came the war, and with it came their unique opportunity. For 18 months, while we built trucks, they worked on this new model.

They made over 100 important improvements. Part by part they added an average of 50 per cent more strength. They spent over $250,000.00 for new machines and equipment, just to build parts better and to test them better. They created a staff of 135 trained inspectors, to measure and test and insist on perfection.

The result is this new-standard Mitchell, combining 100 of the greatest advances that ever were made in Sixes.

New From End to End

The design is new, the color and the top. The radiator is larger, and the wheels, with 34x4-inch tires.

The steel frame is deeper, adding 50 per cent to the strength. Rear axle strength is increased 50 per cent, brake efficiency 75 per cent. The gears are 25 per cent stronger by actual crushing test.

There is a new-type disc clutch. There are 123 drop forgings. Chrome-Vanadium and Chrome-Nickel steels are lavishly used in construction.

The ball-bearing steering gear is made 10 per cent stronger. Our new crank shafts show a tensile strength of 150,000 pounds per square inch. They are perfectly balanced on two costly machines.

Gasoline Saving 25%

Gasoline and oil cost is reduced 25 per cent. This largely comes through the use of a thermostat to regulate the water system. It controls the temperature of the air, liquids and gases. The carburetor intake is twice better heated, so the gasoline is vaporized and combustion is complete.

To make staunch bodies we use frame material costing twice the usual. We use interlaced hair in the upholstery. We use four coats of varnish, instead of the usual two, to double the life of our finish.

We give ample room with a 120-inch wheelbase. Compare that with other 5-passenger Sixes.

But one part could not be bettered—our long cantilever rear springs. Out of 40,000 now in use, not a spring has broken. And they have made the Mitchell the easiest-riding car in its class.

Undersells All Rivals

This new Mitchell, despite all these new standards, still sells below all comparable cars. That is due to our wonderful factory efficiency which has made the Mitchell plant famous. We build the complete car —chassis and body——under scientific methods, which reduce labor cost to the minimum.

Write us for further details. Then go over this new car, part by part, with your nearest Mitchell dealer. When you know this car, you will want this new strength, new endurance, new beauty, new economy.

Mitchell E-40

Price, $1,475, f. o. b. Racine
Wheelbase, 120 inches, 40 horsepower
Six-Cylinder Motor
Cylinders 3¼ x 5. Tires, 34 x 4
3-Passenger Roadster, same price
We also make a Touring Sedan

Present Understanding of Citrus Fertilization

From Address by W. P. Kelley at Citrus Institute at San Bernardino

THE problem as I see it in the citrus groves of California has to do quite largely with the matter of increasing the efficiency of the materials that are now commonly applied. Hitherto whenever a grove has failed to grow properly or to set a sufficient amount of fruit, when the trees become unhealthy and begin to show mottle leaf or other symptoms of malnutrition, it seems to have been the general idea that some fertilizer should be applied, without giving very serious consideration to other factors that may possibly be fundamentally at fault.

I do not wish to be understood as intimating that fertilizers have no efficacy; on the contrary, I merely wish to point out that other factors are often also involved, which tend to defeat the purpose of the grower when he resorts merely to fertilizer, or to lower the efficiency of the very fertilizer which he applies. I have reference mainly to the physical condition of the soil.

Soil Management

I have come to look upon fertilization as a phase of soil management, and what I shall say is partly for the purpose of directing attention to this broader view of fertilization. It may possibly be helpful to consider fertilization from the standpoint of conditions as they actually exist in the soils of citrus groves.

The practice of fertilization has evolved from the idea that fertilizers are used to provide plant food when the amounts or solubility, of that already present in the soil, are inadequate. In this connection there are two reasons and only two, so far as I know, why the problem of citrus fertilization in California is different from that of other crops in other parts of the world. These are, first, the unfavorable physical conditions which irrigated soils tend to assume just below the depth of cultivation; second, the occurrence of small amounts of soluble sodium compounds in the soil. It is largely because of its joint effects on these two features of our soils that I regard nitrate of soda to be an undesirable fertilizer for a considerable part of the citrus area.

Vital to Growth

The unfavorable physical condition now found so commonly in the subsoils of citrus groves operates to interfere with the maintenance of satisfactory conditions of both moisture and plant food, and this is in my opinion, a very real matter; the moisture and food requirements of citrus, as is the case with all plants, are vital to its growth.

I prefer to look upon both the moisture and food requirements as being parts of an inseparable whole. Therefore, when the feeding habits and power of citrus are referred to, both water and plant food should be considered. The ability of any plant to satisfy its food and moisture requirements ordinarily depends upon three factors: the amounts present in the environment about its roots; the requirements of the plant; the foraging power of the plant. To these might be added a fourth, namely, the rates at which moisture and its associated dissolved plant foods are capable of moving by capillary force from one part of the soil to nearby or adjacent parts.

Not Extensive Root System

With these points in mind it is interesting to note that at least one of the necessary plant food elements upon which citrus makes heavy demands does not occur abundantly in the soils of Southern California. I refer to nitrogen. The food requirements of citrus are heavy and unfortunately most heavy for the very element that is most deficient in the soil. The foraging power of citrus, when we take its demands into consideration, is not great. Citrus trees do not possess a fine, fibrous and extensive root system such as many of the annuals, and the extent and proportion of feeding roots as compared with the demands of the tree are not as great as is the case with many of the annual and more vegetative crops, such as alfalfa and the like.

It is necessary, therefore, to apply fertilizing materials. But it is still more necessary so to manipulate the soil and irrigation that the maximum amount of the materials applied actually comes in contact with the roots. Now you would hardly expect live stock to be properly nourished if the main portion of their food should be placed in the barn loft, only slightly, but just beyond their reach. In like fashion it is just as unreasonable to expect citrus trees to derive the greatest benefit from fertilizer when all but a mere tantalizing bit of it remains on or near the surface of the ground, where, owing to frequent cultivation, only an occasional root is permitted to grow. The soluble materials are frequently not able to penetrate deeply into the soil owing to the presence of compacted subsoil into which the irrigation waters pass with difficulty and through which, during a considerable portion of the summer, they can scarcely pass at all.

Plowsole

One of the very greatest practical problems before the citrus grower, especially in the interior valleys, has to do with the widely occurring plowsole and compacted subsoil, and the efficiency of fertilizer is intimately related to this matter. The surface soil may be in excellent tilth, with the subsoil only a few inches below entirely unsuitable. I frankly believe that unsatisfactory and in very many cases quite unprofitable tree condition and fruit production are the only reasonable promise of many groves for the near future, unless effective measures be taken to improve the physical conditions in the zone immediately below the depth of cultivation.

It is just in this connection that we find an important reason for the addition of organic matter. We have consistently advocated replenishing the organic matter of soils and the farther investigations go the sounder this doctrine becomes. Decaying organic matter is far and away the most potent agent in ameliorating the unfavorable physical conditions of soils. The importance of this matter can scarcely be overemphasized.

Unless the compacted subsoil or plowsole be efficiently broken up and kept open and porous, it is certain that a large part of the fertilizer applied to the surface will remain near the surface and not come in contact with the main portion of the feeding roots, at least during the season immediately following the spring application. When organic matter undergoes decomposition the small soil particles with which it comes in contact or among which its soluble products diffuse, coalesce into granules. The practical result is that the soil mass becomes more porous and the physical

Cover Crop Is a Fertility Restorer

Agricultural News Notes of the Pacific Coast

Northern California

Shasta County will plant 2300 acres of rice this year.

The traveling tractor school is now being held at Chico, Butte County.

Nearly 300 attended the tractor school held at Chico, Butte County.

Sonoma County plans bonding $1,600,000 for good road construction.

The poultry farm at the Napa state hospital has proven a profitable venture.

Many tons of herring are being used by San Francisco fertilizing plants.

A movement has been started in Butte County to promote a bond issue of a million and a half or two million for road building.

The Humboldt County farm bureau has a most profitable feature in a purchasing and marketing department.

Wine grape growers are given privilege of writing off from income tax loss incurred on vineyards because of prohibition.

Sutter County farmers have started a squirrel drive which is under the direction of Harry P. Stabler, horticultural commissioner.

The Lassen national forest accommodated during 1918, 4505 cattle, 50 horses, 16,000 sheep. These practically all from Tehama County.

J. A. Teagarden, for four years president of the Placer County farm bureau, declined to act longer and has been succeded by E. C. Bedell.

Mendocino County grape growers have been offered a contract for their crops for ten years, $14.30 per ton for grapes reaching 22 per cent sugar.

Solano County farm bureau meetings held during the earlier days of this month made plans for a strong campaign against squirrels and gophers.

Tehama County's farm center meetings: Oak Park, March 14; Richfield, 17; Corning, 19; Bend, 21; Los Molinos, 24; directors' meeting March 21.

Eldorado County proposes to go after pear blight. The horticultural commissioner expects to make thorough inspection of every orchard in the county.

C. J. Evans, federal poultry specialist, has been assigned to work in Sonoma County. His headquarters are in the office of Farm Adviser Merrill at Santa Rosa.

The regular monthly meetings of the Tehama County farm bureau will be held as follows: Dairyville, March 12; Oak Park, 14; Richfield, 17; Corning, 19; Bend, 21; Dos Molinos 24.

Castella, Shasta County, is a large producer of strawberry plants, having shipped out over 900,000 plants at an average of around $8 per thousand. Watsonville is her biggest customer.

The executive board of the Northern California Counties' Association is deliberating over plans for highway improvement in the five counties of Siskiyou, Trinity, Lassen, Modoc and Shasta.

Sutter County farmers are asking the state legislature to restore the old Sutter by-pass or else force the Armour interests to complete the east wall of the by-pass and relieve flood conditions.

Central California

Kerman, Fresno County, has a live wire pig club connected with its high school.

Sale of fat hogs at Tulare resulted in 568 hogs being sold, $15.35 being top price.

Several farms on the Waterford Irrigation District, Stanislaus County, are planting figs.

Sylvan Farmers' Union held annual meeting recently and elected officers for the coming year.

Farmers at Modesto, Stanislaus County, are taking steps to secure more effective control of noxious weeds.

Santa Cruz County, which has long been a large producer of loganberries, is planting more extensively than in former years.

County Horticultural Commissioner C. F. Collins of Tulare County reports cost of squirrel eradication as less than crops consumed by the pest.

Santa Cruz County farm bureau has been keeping the wires hot to Washington urging passage of Smith-Lever bill.

A large tract of land at Corcoran, Kings County, is to be organized into the Corcoran irrigation district. It will include about 55,000 acres.

The Madera County farm bureau has voted that the Madera County unit unite with the Hilmar Mutual Fire Insurance of Merced County.

The cattle protection board of Kings County is taking action to secure the enforcement of the branding law and the registration of various brands.

There is a proposal to build a sugar beet factory at Sacramento. It is thought much land in that section could well be planted to sugar beets.

The Turlock Merchants and Growers, Inc., has elected officers and is ready for the coming season's marketing of melons and other Turlock grown products.

The best herd in the Stanislaus County farm bureau cow testing department showed a daily average butter production for the month of January of 1.5 pounds.

A mass meeting of vineyardists at Lodi forwarded petition to President Wilson to extend time before enforcing the dry regulations which are to go into effect July 1.

Speculative prune packers have named 1919 prune prices as follows: 30s, 10¾ cents; 40s, 10 cents; 50s, 9 cents; 60s, 9 cents; 70s, 8¾ cents; 80s, 3¼ cents, and 90s, 7¾ cents.

Farm center meetings Merced County: Planada, March 14; Livingstone, 17; Fruitland, 19; Amsterdam, 21; Merced Colony, 24; El Nido, 26; Eschscholtzia, 28; Hilmar, April 1; Cottonwood, 2.

Merced County wheat growers have had some difficulty with bluestone treated seed but are still insisting that with greater care treatment with bluestone is essential and will accomplish excellent results.

Cotton growers of San Joaquin County recently met at Fresno and voted to pool interests and ship entire crop of the valley to Boston. The ginning will be done at Fresno. Pima seed is now being ordered from Arizona for the coming season's crop.

Southern California

Imperial Valley sheep men are installing shearing plants.

Imperial Valley is hoping for the early installation of a state farm school.

Imperial County held its annual farm bureau assembly at El Centro, March 1.

Independent bean growers of Ventura County are organizing an independent bean pool.

Pomona now has the lid on tight as to no smoking allowed in her citrus frost fighting campaign.

Southern poultrymen are planning for shipping early broilers direct to the New York market.

The California bean situation is not improved, in fact prices are shading slightly almost every day.

Former residents of Michigan meet in picnic in Sycamore Grove park, Los Angeles, on Saturday of this week.

Garden Grove Citrus Association, Orange County, recently held its annual banquet and election of officers.

The bean situation has resulted in a scandal and the removal of two officials of the national food administration.

California Bean Day date not yet chosen, but it is proposed to make it a great day all over the United States.

The frost insurance measure proposed by the state legislature is meeting with support of many citrus growers.

The Riverside County farm bureau is canvassing the county as to live stock and as to seeds which farmers have to sell.

Walnut growers of the southern end of the state are hoping for the appropriation of $10,000 to investigate the walnut moth.

Garden Grove, Orange County, is one of the largest producers of chili. The shipments last year aggregated 430 cars or 6350 tons.

Directors have been elected for the 1919 Ventura County fair and dates will soon be named. J. W. Hitch has been chosen president of the directors.

The recently elected officers of the Imperial County farm bureau are: B. D. Irvine, president; C. F. Boarts, vice-president; J. J. Carr, treasurer; A. M. Nelson, secretary.

Riverside fruit growers are making a canvass of the situation as to supplies for canneries, with an idea of balancing up products so as to keep canneries busy through the season.

The Imperial Valley irrigation district has appointed a commission to inspect Salt River and Yuma reclamation projects and report as to efficiency of government work on canal projects.

Imperial County dairymen are planning a new cow-testing campaign and at the end of ten months will issue certificate of production to every member cow which makes 300 pounds or better of butterfat.

The Orange County farm bureau cow testing department is now signing up dairymen. When 1100 have been signed up the membership will close. Members will pay $1.50 for one year's testing for each cow in herd, the minimum payment to be $15.

The Coast and General

Mabton, Washington, has voted to hold a hay palace fair this fall.

Sweet potato weevil is spreading rapidly over the state of Texas.

Trade is being resumed with that portion of Germany under control of the allied armies.

The Western Washington Horticultural Association will hold its next meeting at Puyallup.

Cotton acreage in the state of Texas will be reduced this season. Peanut acreage will be increased.

Congress has voted to increase the power of President Wilson in maintaining the $2.26 wheat guarantee price.

A wool growers' association in Dayton, Washington, plans returning to branding of sheep to prevent stealing on the reserve.

Necessity of conserving rice for local consumption is restricting export from India. The short crop is due to lack of rain.

The secretary of the National Wool Growers anticipates a price for the spring clip of wool somewhere between 50 and 50 cents.

The food administration has removed the restrictions on prices of pork products and it is thought the first effect will be material increase.

Manufacturers of woolens used in this country in January of 1918 only 38,200 pounds, which is a little more than half what was used in the same month last year.

Thirty suits for damages to apples alleged to have been done by frost during transportation to the East last season, are on file with the county clerk at Yakima, Washington.

A widow living near Chandler, Arizona, was pleasantly surprised a few days ago when a number of her neighbors with 20 horses and a tractor appeared and seeded her ten-acre ranch to alfalfa.

A reclamation project involving about 26,000 acres of Gray's Harbor overflowed lands is expected to be accomplished for returned soldiers and sailors. The work will be done by the federal government.

The experimental stage of cotton growing has terminated in Argentina and commercial planting will be made this year for the first time. It is thought the labor situation is such that the production will be very limited.

Texas, which is becoming one of the largest pecan producing states of the Union, is complaining because government experiment station with various varieties of nuts is not given so much attention in that state as some others.

Arizona is contemplating a revision of her bill providing for agricultural and horticultural commission. The new bill provides for five commissioners instead of three under the old law, with per diem allowance instead of regular salary.

The Walla Walla cow testing association has increased the butterfat production of the dairies of its members from an average of 255.4 pounds to 316.1 pounds and the average profit above feed cost from $34.85 to $66.86. This entirely due to weeding out unprofitable cows.

Sugar---and How It is Made

By Arthur L. Dahl

THE World War has taught us the value of sugar as a food. Until we had to count the spoonfuls and receive our little cubelets with our coffee, instead of having free access to the sugar bowl, we had not realized how essential sugar was to our happiness. Like other sweetening influences that have been as free to us as the air, and of which we took no thought, sugar proved the old adage that "Absence makes the heart grow fonder."

But the sugar bowl is back again on the table, and just as we study the face of a returned friend, we are more interested now than we ever were in knowing the life history and experience of this sweet character.

Sugar is made either from cane or beets and these two sources of supply are grown in many parts of the world. In California the sugar beet industry is an important one, and although no sugar cane is grown in the state, practically all of the production of sugar cane of the Hawaiian Islands is refined at San Francisco, the refinery of the California-Hawaiian Company being one of the largest and best equipped in the United States.

The United States grows only 23 per cent of its consumption of cane sugar, getting the rest from Cuba, Hawaii, Porto Rico and other countries. Cuba furnishes us with 48 per cent of our cane needs, Hawaii with 12 per cent, Porto Rico with 10 per cent and other countries about 7 per cent. While the development of the sugar beet industry in the United States has been rapid, the total production of sugar by the beet factories would supply our own demands for only about three months each year. In several of the European countries, such as Germany, Austria and France, the production of sugar from beets has reached enormous proportions, and large exports were made, in normal times, by both Germany and Austria. In the recent war, Germany's food problem was largely solved by reason of her having on hand vast quantities of sugar intended for export but which was held up by the Allied blockade. This supply was used to take the place of fats and other heat unit foods lacking, and sugar thus played a prominent part in keeping up the health and strength of the Germans.

In Hawaii, Cuba and Porto Rico sugar is the principal industry and a majority of the people are directly dependent upon the cane fields for their living. Those not directly engaged in the growing or grinding of sugar cane are dependent upon the wages received by these workers.

The United States consumes more sugar than any other country, requiring about one-fourth of the world's production. According to the last census, the per capita consumption of sugar in the United States was 89.1 pounds, being only exceeded by the per capita consumption of the United Kingdom, Australia and New Zealand.

All imports of cane sugar to the United States come in the form of raw or unrefined sugar, the refining being done in some one of the 18 large refineries located in this country. Twelve of these refineries are on the Atlantic Coast, four near the Gulf of Mexico and two on the Pacific Coast. These refineries handle only cane sugar, the sugar beets grown in this country being processed in factories located near the growing fields. As sugar beets are perishable, it is essential to have them treated as soon as possible after picking.

Although not as large a producer of cane as Cuba, Hawaii has developed her industry to the highest degree and the sugar produced in the islands is of a high quality. A description of the methods of growing and grinding sugar in Hawaii will suffice for other cane growing countries, as the differences are merely those of local customs. In Hawaii the cane grinding mills are comparatively new and up to date and modern methods are practiced throughout. The sugar growers maintain a full corps of scientists and chemists to constantly study plant diseases, insects, destructive pests, and to experiment with new varieties with a view to improving the yield and quality of the cane. In the Hawaiian Islands it takes at least 18 months to produce a mature crop, and the planting and harvesting is going on in adjoining fields throughout most of the year. In some other cane countries the crop is harvested at the end of each season, even though the cane has not reached its maximum growth.

Great Refinery on San Francisco Bay

View of California-Hawaiian Sugar Refining Company. Cargoes of crude Hawaiian products are landed here and refined for American consumers.

The making of sugar from beets is entirely different from the processes used in the cane industry. Sugar beets are a bulky crop low in value per unit of weight, and beet growing areas must, of necessity, be confined to localities on some railroad line, usually within 100 miles or so of a mill. At the present time there are 15 mills in California, and over 144,000 acres devoted to beet culture. Beet lands should be level, with deep soils, and organic matter and plant food must be abundant. Ample moisture must be supplied, either by irrigation or rainfall. A long growing season is required.

Sugar beets are usually grown under contract with a near by mill, two methods of payment being used. In one the crop is bought on a flat tonnage basis, while in the other payment is based upon a sliding scale depending upon the sugar content of the beet.

To secure maximum crops the growing field must be placed in a fine state of cultivation to as great a depth as possible. The beet roots penetrate deeply into the soil, and the greater the depth of plowing the easier can the roots burrow. Planting occurs between October 1 to June 1, depending upon local conditions. In Southern California planting is usually done in the fall, while in the Sacramento Valley it is done in the spring. The seed is usually furnished to the grower by the mill at actual cost. In planting the seed is sowed by drills capable of planting from four to eight rows at once, spaced from 16 to 24 inches between rows. From 12 to 20 pounds of seed are required per acre. Cultivation is started as soon as the rows are well defined and is designed to provide the three-fold object of weed destruction, aeration, and maintenance of a loose earth mulch for the retention of water. Cultivation is continued until the size of the plants prevents instruments passing down the rows. Thinning is then practiced and hand hoeing carried on. Irrigation is almost necessary except in sections where rainfall is regular and ample, and the flooding system is practiced in most fields.

Fall sown beets reach maturity in from seven to eight months, while spring sown beets will mature in from four to five months. Harvesting is done by plowing out the beets by specially constructed implements which loosen the beets and enable them to be picked out of the soil by hand. They are loaded on wagons which take them to railroad cars, or if near the mill, they are hauled directly to the mill. An average yield of sugar beets is 10 tons, but sometimes 15 tons or more is obtained. A yield under eight tons per acre would not pay for the cost of production.

Tractor Handling Three Loads Beets on Up-to-Date Dump

At the mill the beets are washed and then sliced by machines. The slices or "cossettes" are conveyed by endless belts to the cells of the diffusion battery. The sugar from beets is not extracted by crushing, as with cane, but by diffusion. Beets are made up of a great number of plant cells, the walls of which are porous membranes. These cells are placed in contact with water or juice of lesser sugar content than the juice in the plant cell, and as a result the juice is gradually diffused from the beets and carried away in the circulating water which is added. When this water or juice has reached a certain stage of concentration it is drawn out of the cells and sent to the next stage in the process of manufacture. This juice is quite dark in color, and it is next treated with from three to four per cent of caustic lime in the form of a thick milk. After being agitated, the mixture is treated with carbonic acid gas which removes some of the impurities and reduces the color to a brilliant amber. The carbonation is continued until the juice is only slightly alkaline, when it is passed through filter presses to remove the solid matter. The juice, after being filtered, is again treated with carbonic acid gas to further reduce the caustic lime, and after an additional filtration it is sent to the evaporators for concentration. At this stage it contains about 82 per cent of water which is reduced, by evaporation, to about 40 per cent. The thickened liquid from the evaporators is sent to the sulphur station and treated with sulphur fumes in order to precipitate the soluble impurities and reduce the color. It is then heated to the boiling point and filtered through cloth, and passed on to the graining process. From this point the graining process is identical with that of the cane, and consists of progress through the vacuum pans, centrifugal driers, granulators and screens, and into bags in the packing room.

In California sugar beets produce about 17.82 per cent of sugar, of which 15.64 per cent finds its way into the sacks, the remaining 2.18 per cent being lost in the process.

MANUAL OF INSECT AND PLANT DISEASE CONTROL

Fruits, vegetables, and the principal farm crops grown in California are listed in alphabetical order, with the most approved methods of control of their diseases and their insect enemies indicated in each case, in a "Manual of Insect and Plant Disease Control" which has just been issued by the college of agriculture of the University of California. The manual is adapted to the needs of the commercial grower of fruit as well as to the needs of owners of family orchards and back yard gardens. The poisoning of grasshoppers, squirrels, Argentine ants, and the spraying of plant lice are among the general subjects discussed. About thirty selected formulas for disease and insect control are given.

The manual has been compiled by Professors Ralph E. Smith, E. O. Essig, and Geo. P. Gray, specialists on plant pathology, entomology, and economic poisons.

California, according to these authorities, has more than half a million acres of bearing orchards, a partial census of the acreage of principal fruits and certain farm crops lists 3,000,000 acres under cultivation. The state spends $3,000,000 a year for the purchase of chemicals for the control of insects, plant diseases, weeds, and rodents.

Pay For 12-20 Horsepower And Get Full 15-25

PUT the E-B 12-20, S. A. E. Rating, Model AA Tractor to work on your farm. Use it with the E-B 102 Tractor Plow. This is a combination that stands up to the hardest plowing with plenty of Power, Dependability, Economy, Ease of Handling, and E-B Service backed by capable, helpful dealers who know tractors.

THE E-B 102 TRACTOR PLOW
Plows More Acres Better With the Same Fuel
Easy to handle and easy to pull. E-B Quick Detachable Shares make furrows turn with less kerosene cost. Sharp-share plowing readily done when shares are so quickly applied and removed. Sharp shares keep channels of moisture circulation open—better soil conditions.

Surplus Power—because the 12-20 rating on the S. A. E. basis is the most conservative known, 25% extra power.

Dependability through 67 years of implement manufacture and 12 years of tractor building. Enclosed gears, high-grade materials and equipment, such as Hyatt Roller Bearings, K-W Magneto, high-grade Radiator, etc.

Economy—25% greater power with less weight. Kerosene motor cuts fuel cost.

Ease of Handling—E-B Auto Control. Ask your dealer for complete facts.

Citrus Thrips

BULLETIN 674, issued by the U. S. D. A., is of value to citrus growers of the Southwest. It is by J. R. Horton, scientific assistant in tropical and subtropical fruit insect investigations.

The thrips insect has been a pest in the San Joaquin Valey for some years. More recently it has been affecting the orchards of Southern California and is a serious problem with Arizona citrus growers. It is present on the trees practically all the year; its work on the foliage beginning early in April and continuing till late December. Its most serious work on the fruit is during the months of May and June, and some orchards are seriously affected during the month of April when blossoms are attacked. Spraying to accomplish best results is during the months of May and June and August 15 to September 15.

History of Thrips at a Glance

Graphic illustration of the seasonal activities of the citrus thrips as related to blossoming and later growth periods of the orange, and indicating also spray periods.

Injury

The citrus thrips is a sucking insect feeding on the plant juices of the leaves, the fruit rind, and the bark of tender stems, in much the same manner as the mosquito draws its food from its victims. For this reason the insect can not be killed by stomach poisons sprayed on the plant, but must be controlled by sprays that kill by contact.

The injury caused by the citrus thrips begins with the seedling orange tree. The leaves are scarred and distorted, and to a certain extent the stock is devitalized. When the seed stock is budded and the foliage of the seedling trimmed off, the thrips attacks the bud. Nursery buds will make a fine, luxuriant growth of 2 to 3 feet in a season if properly sprayed to protect them from thrips. On the other hand, many nursery trees have the leaves and stems so badly scarred and twisted as to give them a blighted, unsightly appearance, and are so retarded in growth that they must be held in the nursery for a year or more beyond the proper time for sale in order to meet the size requirements, thus decreasing the nurseryman's profit by the cost of the extra care. It sometimes happens that this class of stock is sold along with better trees, and the thrips injury continues for several years in the orchard. The writer knows of 5-year-old and 7-year-old groves in the foothills of Tulare County which have been held back, principally by thrips, to such an extent that the trees are no larger than 3 and 5 year trees in less infected situations. From the general appearance of such trees it seems evident that they will never attain the size and bearing capacity of trees which have escaped severe thrips infestation in the nursery and during their early years in the orchard.

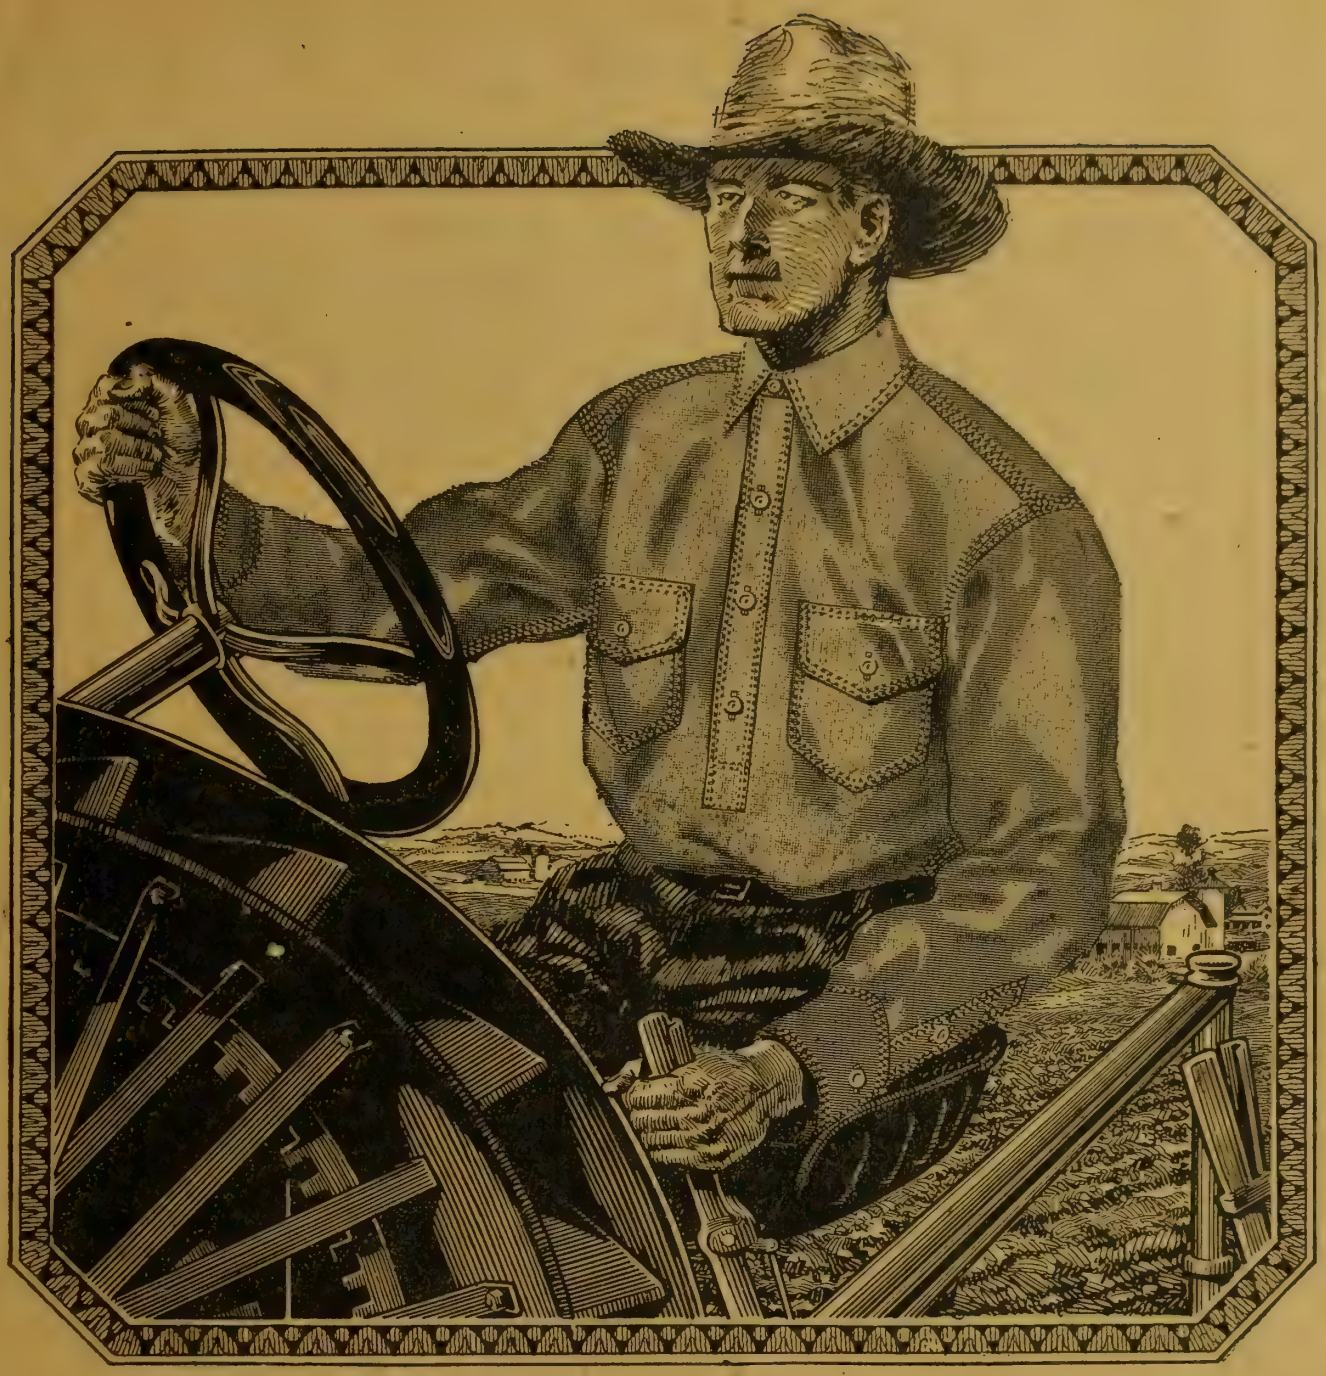
As the young fruit appears it in turn is attacked, and its market value at maturity is much reduced by the enlarged feeding scars and scabbing. A larger percentage of small-sized fruits than ordinarily develop results, and there is a total loss, as the result of early and severe scabbing, of a proportion of the fruit. To calculate the damage caused by the insect in reducing the grade of the fruit, it is necessary to know the system of grading and the relative market value of the grades.

Spray Mixtures and Dilutions

Of the large number of combinations of insectides tested, the following have given the best results, and any of the mixtures here recommended may be relied upon to do good work:

Commercial lime-sulphur.—If the lime-sulphur is of a density of 36 degrees on the Baume scale, dilute 1 gallon with 56 gallons of water; if of a density of 33 degrees Baume, dilute 1 gallon with 50 gallons of water.

Commercial lime-sulphur and blackleaf tobacco extract (40 per cent nicotine sulphate).—Dilute 1 part of the commercial lime-sulphur, if 34 to 36 degrees Baume, with 86 parts of water; if 30 to 33 degrees Baume, with 75 parts of water. Then add 1 part of the tobacco extract to 1,000 parts of the lime-sulphur diluted as above.



Blackleaf tobacco extract (40 per cent nicotine sulphate).—Dilute 1 part with 800 parts of water.

Time and Number of Spray Applications

Unfortunately no specific dates, which will hold for every season, can be fixed for the applications of the spray. The investigations of the seasons of 1910 and 1911 have shown that the date on which the thrips first become numerous and injurious and the navel orange blossoms lose their petals varies as much as 30 days in certain seasons, due to the nature of the spring weather, and, further, that it varies in different orchards in the same season. The greatest injury to the fruit is done between the time the petals fall and the fruit is half grown. It has been demonstrated that three applications of the insecticide are necessary during this period to prevent marking of the fruit. The first spring growth has usually hardened by the time the petals have all fallen, and the thrips then seek the young fruit. The petals do not all fall at once, but come down gradually, and the transfer of thrips is therefore gradual.

The first application should be made as soon as four-fifths or more of the petals have fallen. This checks the insect at a time when the orange is most susceptible of deep injury and when the blossoms have passed the period at which pollination might be interfered with by the spray.

After the first application more

Wear "OLD FAITHFUL"—the Comfort Shirt

The "OLD FAITHFUL" work shirt will give you that feeling of genuine comfort every man seeks.

"OLD FAITHFUL" is typically American—built *big* throughout to permit great freedom of action—triple stitched on all strain seams—reinforced—has two large pockets with buttoned down flaps, just where you can reach them easily. Go to your dealer—ask him for "OLD FAITHFUL". It's one of the family of

RELIANCE WORK SHIRTS

made famous by the senior member, the Milton J. Levi Man. "OLD FAITHFUL" comes in blue and grey chambray, black sateen and other standard fabrics—is good-looking and will outwear three ordinary shirts.

Look for the name "Reliance" in a work shirt—it is a guarantee of quality.

"Black Beauty"—"Army"—"Honor Bright," the latter for boys, are other familiar Reliance brands.

larvae will issue from eggs deposited in the very young fruit, and additional adults will appear from the specimens pupating at the time of the application. The second application must therefore be timed to prevent this renewed atatck, which may be expected to reach the danger point in from 10 to 14 days after the first spraying. This second spraying should not be too long delayed, as a comparatively few larvae may, by their persistent habit of feeding in a circle about the base of the fruit, cause considerable injury. Special effort should be made to drench all the fruit as well as the few remaining tender leaves thoroughly, as it is here only that the insects occur.

The third application may be longer delayed if the first two have been thorough and well timed. It generally takes the insects from two to three or four weeks to become dangerously numerous again, as they reinfest the sprayed trees very much more slowly after the second application.

After the third application the fruit rapidly loses its attractiveness, and the insects then find it necessary, in order to secure food, to spread out over the few remaining tender orange leaves and certain miscellaneous food plants. During the later part of August and in early September there is usually another abundant growth of shoots upon which the thrips congregate in great numbers. A fourth application in late August or more probably in September should be timed to catch the insects as soon as they become numerous and before any great amount of leaf injury appears.

The importance of protecting this growth is evident to those familiar with the stunted condition of orange trees in certain orchards of Tulare County as the result of continuous feeding of large numbers of thrips during the first five or six years of growth. The writer has in mind an orchard in which trees five years from the nursery are no larger than the average 2-year-old trees in localities more favorably situated with regard to thrips, and which each year have a very large percentage of the leaves so severely injured that they roll up into tight curls.

In addition to the department publication Dr. A. W. Morrill, consulting entomologist of the state of Arizona, has issued Circular 23 from the press of the college at Tucson.

Water Right Legislation

In order to secure more general utilization of lands and waters of the West, especially of Utah, the experiment station of the state agricultural college has made investigation and now issues Circular 138 on legislation concerning water rights. It is particularly significant that all of these ways of increasing our water supply, and also many others, involve water rights. There is in reality no one factor in irrigation which will have greater influence in future development than that of water rights.

The findings of its commission cover some 28 pages, from which we quote the summary:

Nearly every available means of increasing the water supply of Utah, and of other western states is in some degree dependent on water rights, a factor in irrigation that is likely to influence future development more than any other.

The common law developed in England asserts that rights to the use of water along a stream naturally belong to the owners of land on its banks, that is, to the riparian owners. The civil law, developed in an arid region, maintains that all waters are the property of the crown and rights may be obtained only by grant. The American doctrine of appropriation maintains that waters are the property of the public to which rights may be obtained by appropriation and use.

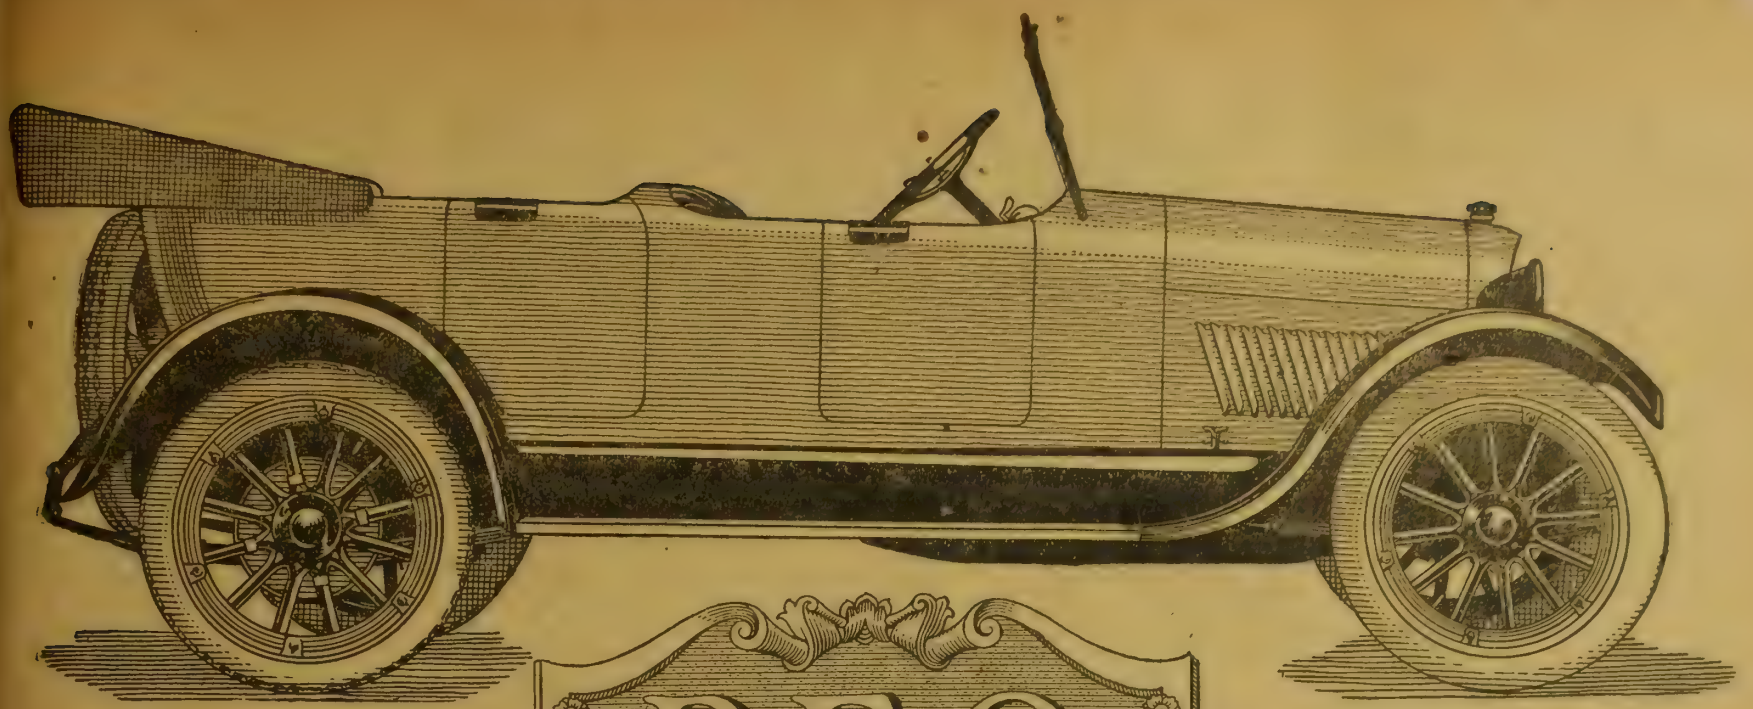
Legislation concerning water rights, to be complete, must provide for the acquirement of new rights, the defining of rights which have vested through use, and the public distribution of water according to established rights.

Rights to water in the West were originally acquired by diversion and use, later by posting notices at points of diversion, and now by application to a central state office, usually that of the state engineer.

Applicants for water rights must announce the purpose for which water is to be used, and if for irrigation, they must describe the proposed canals and lands to be irrigated, specify the time necessary to complete construction and use the water, and give other information required by the state engineer.

Rights to water which became vested through use before laws governing the acquirement of rights were enacted are now defined by the courts, by administrative boards, and by administrative boards and courts. The first method is called the Colorado system; the second, the Wyoming system; and the third, the Oregon system, because the respective systems were designed and first used in these states.

Eight states including Utah follow the Colorado system of defining water rights; three follow the Wyoming system; three, the Oregon system; and three have not yet provided specific procedure for defining water rights.



Advocates of the Colorado system argue that it is the only one that is legally sound, but the Wyoming system has been upheld by the supreme courts of Wyoming and Nebraska and the Oregon system has been repeatedly upheld by the supreme court of that state and it was recently sustained by the United States supreme court.

The Colorado system as followed by Utah has been practically inoperative during a period of 15 years, although the state engineer has completed surveys on five of the sttae's chief river systems.

The Colorado system of supervising the distribution of water to those entitled to its use, which consists of dividing the state into a few large divisions along drainage lines and dividing each division into the necessary number of districts, has been followed in general by all but three of the irrigated states.

If the public were represented in all proceedings for the purpose of defining vested water rights, and if the definition of rights were based on long-time, painstaking, unbiased duty of water, and other investigations, it is believed that the permanency, or period of endurance, of each decree could be greatly increased and the ultimate cost of litigation thereby decreased, and also that the interest of both the individual and the public would be thereby better protected.

Public distribution of water, the goal of water rights legislation should be improved (1) by making safe and adequate financial provision for the employment of water commissioners, (2) by preventing divided jurisdiction of streams, and (3) by standardizing and keeping permanent and accurate records of water deliveries.

This Is March!—And History Repeats Itself

SPRING IS ALREADY HERE! We are a little late with our regular annual hurry-up message.

ALWAYS AT THIS PERIOD we find it necessary to warn tardy or indecisive buyers that only those who place their orders early—which means at once—can hope to get Reos for Spring delivery.

REALLY, WE MIGHT save the trouble of writing a new advertisement each year—the same copy would fit just as well one year as another.

THE SAME STORY might be told in the same way—so consistent and so persistent is the year-after-year demand for Reos.

FOR, NEVER SINCE THE DAY the first Reo left the Lansing factory and went into the hands of its delighted owner—never since that time has it been possible to make enough automobiles to supply all who wanted Reos.

ORDINARILY—and to a normal degree—that is from the factory standpoint, an ideal condition.

BUT IN MARCH of each year the condition becomes aggravated by an excessive over-demand that is at times discouraging to say the least.

CERTAINLY WE COULD build twice or four times—or ten times—as many Reos per annum as we do.

BUT THE REO POLICY has never been to build the most automobiles—only the best.

WE MAKE ONLY AS MANY Reos as we can make and make every Reo as good as the best Reo that ever came out of the factory.

THAT'S THE REASON for the tremendous demand that always exists for Reos. Reo quality—Reo low upkeep—due to a strict adherence to that Reo policy.

REO IS FIRST CHOICE of discriminating buyers. That's the kind of folk for whom we design and build Reos.

THEY ARE THE KIND of buyers a manufacturer and a dealer appreciates and therefore most dislikes to disappoint or to offer substitutes.

AND WHILE OCCASIONALLY a dealer who also handles some other line will try to sell a customer his Second Choice, because he can't get enough Reos to supply his local demand, he never really likes to do so.

ALL DEALERS PREFER to sell Reos—because they stay sold. And every Reo sold sells several more.

THEN THERE ARE the repeat orders from present Reo owners.

ALWAYS THESE HAVE constituted a large percentage of the Reo demand. They are getting to be a larger percentage from year to year because of the larger number of Reos that have been many years in service. Longer than any other comparable car.

OF COURSE a Reo owner always wants another Reo—the percentage of re-sales to Reo owners is amazing and a matter of which we are most proud.

TO ALL SUCH, THEN, we issue the usual March warning—see your Reo dealer at once and place your order.

MAKE IT DEFINITE by paying him a deposit and specifying a date for delivery. Else he cannot, in fairness to other buyers, reserve a Reo for you.

THEN REST SECURE in the knowledge that you will be one of the "lucky ones" to get a Reo this season.

THERE WON'T BE—cannot be made—enough to go round. That is now as certain as the same thing always has been certain in all previous years since the inception of Reo.

SO DON'T DELAY. Decide now. Order at once.

TODAY won't be a minute too soon.

Reo Motor Car Company, Lansing, Michigan

We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

It takes a great deal of feed and water to make 14 tons of milk and over a half ton of butter. More, it takes highly organized efficiency. Such efficiency is visualized on the cover page this week in the photograph of Ormsby Segis Marie. More particulars as to Ormsby's life are given on another page, but just a few figures here to show that she is a handsome doer: Her record of 27,025.7 pounds milk in one year as a senior three year old is a world's record in class, and butter record of 1074.54 pounds is second highest in class. At last freshening she made 30.64 pounds butter in seven days and is now milking as high as 106 pounds per day. She is a granddaughter of King Segis.

GUILT IS PERSONAL

Now comes the German claim that the higher-ups who were responsible for the awfulness of this war are not in any sense guilty, that the government was responsible and that since the government is impersonal it cannot very well be hanged. This sounds much like the problem of some American culprits who have in the past claimed that though their corporations may be steeped in guilt, all individuals connected with it are exempt from punishment. This theory has been pretty well driven out of America; we hope it will be out of Europe.

COST DATA

Secretary Houston reports that he has been unable to give out definite data as to farm production costs. "I am by no means satisfied with our present plan and especially with that part of the work of the office relating to statistics of costs of farm crops."

Prof. R. L. Adams, formerly of the University of California and now in Washington with the bureau of farm management, is giving especial attention to this one matter of farm crop costs.

GREAT FUMIGATION PLANTS

Owing to the great traffic in agricultural plants, seeds, fruits and agricultural products across the Mexican border the department of agriculture has established great fumigation plants for the purpose of preventing the introduction into this country of injurious insects. Some of these fumigation houses will take in 15 railway freight cars at one time. They are tightly sealed and hydrocyanic acid gas is used to destroy every living thing. These are said to be the largest fumigation plants in the world.

FIRMLY ESTABLISHED

The federal land bank of Berkeley announces that its present average monthly loans to farmers is $500,000. This bank has loaned to farmers of the Southwest considerably in excess of $10,000,000. It is now on a self supporting basis, more, it is providing a fund which will in a short time wipe out the initial expense of its establishment.

The system has proven a disappointment to many, especially to fruit growers, who feel that California values are not fully appreciated. We think perhaps this is true and believe that a more liberal policy will be followed as the bank feels its way and becomes more fully established. In a recent statement we note that: "Our income increases every month and our expense remains stationary. It begins to appear now that by April 1st we will have absorbed our entire initial organization expense and the bank will be on an even keel. After this date, therefore, we ought to begin to build up a surplus account, and when this has reached a satisfactory amount, to begin the payment of dividends."

> Let the public demand that their representatives be big enough and broad enough to deal with the facts and nothing but the facts, to interpret them to the best of their ability and conscience and to follow their conclusions regardless of consequences. Democratic government will be sufficiently difficult if we apply this standard. If we permit any other to prevail, its future will be full of doubt. Let us remember the blessings of our institutions and keep before us their real spirit and meaning. Let us see to it that those who come among us from other countries not so favored, whose inheritance makes it difficult for them to understand the meanings and purposes of democratic institutions, shall catch their significance and especially be made to understand that here we have a rule of law and not of whim or of force.—Secretary of Agriculture D. F. Huston.

BONE DRY

The southern end of the state is anxiously watching the clouds and hoping for a soaking rain before the end of the rainy season. In fact, excepting for the heavy October rain this has hardly passed for a rainy season south of the Tehachapi. The total precipitation is little more than six inches. On the other hand the northern end of the state has been blessed with an abundance; in some sections farmers have complained somewhat because of inability to get the ground in best condition. Half of March is yet here and soaking rains may yet come. At this moment the clouds are looking a bit promising.

FARM BUREAU CONFERENCE

Beginning March 17 at the Davis farm school there will be a conference of farm advisers and assistants and farm bureau delegates. Sessions will continue at Davis until the 21st when the attendants will motor to Berkeley to attend the conference until the 25th. On the morning of the 26th the entire delegation will take autos to Southern California, making the trip down the coast. A similar trip last year followed the valley and over the Tehachapi. The party will arrive in Los Angeles March 30 and remain in that county a couple of days, from there taking in points in Orange County, Riverside and San Bernardino Counties. The conference will end with one day at Riverside, April 2.

There will be demonstrations showing methods of handling orchards, farming problems of nearly all kinds, control of insects, scaly bark of citrus trees, etc. At the breaking up of the party at Riverside the northern delegates will proceed home by way of the valley.

President Joyce of the bank at Borkeley is now in Washington attending a conference of presidents of the 12 federal land banks in the United States.

NATIONAL DAIRY SHOW

Since 1914 the National Dairy Show has not been held in Chicago. That show resulted in tragedy for some of the finest herds of pure bred cattle ever gathered together, for it was the occasion of the spread of the foot and mouth disease. Some dairymen vowed they would never again take their live stock to a Chicago show. Since then the dairy show and the congresses which accompany it have been held at Columbus, Ohio, but announcement is made that the next meeting will be at Chicago October 6 to 12. The department of state at Washington has issued invitations to governments of the Old World to unite in this, which it is hoped will be the greatest of shows of dairy cattle and dairy appliances.

WHEAT ON FARMS

California wheat growers are now holding only about 7 per cent of their last season's production of wheat. This is wheat actually on the farms and does not include wheat in the larger warehouses. In bushels California farmers hold this year 531,000 as against 520,000 last year same date and 336,000 in 1917.

The farmers of the United States are holding a much larger percentage. They are still holding 129,000,000 bushels, which is 14.1 per cent of the total production. This is lower than either of the two preceding years.

As to the price, congress has acted and the president has signed the bill which makes provision for carrying out the price guarantee for the 191 crop.

It now appears that California wi harvest this coming season about 750 000 acres of wheat. The liberal rai fall of the Sacramento Valley has pu the crops to the good there so tha conditions are reported as better tha normal. Northern San Joaquin Va ley also reports entirely satisfactor conditions. San Luis Obispo grai fields are reported normal.

WILL PORK BE HIGHER?

This is a big nation which ha been a big factor in the ending of big war. The magnitude of the move ments is beyond the appreciation o most of us and they have create problems which have called for th best thought and effort of our bigges men, and still there is a woeful lac of coordination in all of our activi ties. It seems that this lack ha caused a step which may bring suf fering to producers or consumers o both. The food administration an nounces that the war trade board ha rescinded the regulation by which ap plications for licenses to export pori and its products must have attache certificates from the food administra tion. At the same time the war trad board has removed the pork product from conservation lists. These order became effective March 6. The foo administration announces:

"The effect of this action of th war trade board is to destroy th ability of the United States food ad ministration to further stabilize th price of live hogs. It was the desir and has been the endeavor of the foo administration to continue this stabil ization as heretofore and until March 30, when the normal marketing per cent of hogs farrowed in the spring o 1918 would have terminated. The prices under this stabilization plan have been chiefly on the cash value of the corn fed to the hogs. The whole program of stabilization o prices was the outgrowth of the im perative necessity for stimulated hog production for war needs at a time when a dangerous shortage of fats threatened the entire allied world. The obligation with respect to the pigs farrowed in the spring of 1918 began with the marketing of September and would have been terminated March 31. In view, however, of the action of the war trade board the food administration can make no further effort to stabilize prices. Nevertheless, from 85 per cent to 90 per cent of the hogs destined for market, which were to be the objects of the undertaking, have been sold. The European demand for hog products will increase, rather than diminish, the supply of live hogs coming to market, which in March and April will be greatly reduced in numbers. The European markets are opening rapidly to free trading in hogs and the area to be supplied is being made increasingly accessible. The enemy countries are to be given opportunity to secure hog products and other foods. It is possible that as a consequence of the general situation, the price of hogs and pork products may be higher than the stabilized prices which have been maintained and which the food administration desires to be continued March 31st next."

POISONED GASES

It has been suggested that the great stores of poisoned gases left over from the war operations be turned loose on the insects on American farms. In fact, this suggestion has been taken seriously enough that specialists of the bureau of entomology and the federal horticultural board have been appointed a committee to act with a committee of the bureau of chemistry to investigate the possibilities of such utilization of these gases. Strength to the arm of these investigators.

Citrus Canker

Florida growers are joining the U. S. D. A. campaign for better fruit. Three hundred growers of that state recently met at Clearwater and showed great interest in discussion of citrus questions. The greatest interest, however, seemed to center on citrus canker which, the growers hope, is now completely eradicated from the state. However, very naturally these burned orchardists fear more fire. Two speakers, addressing this meeting, are quoted in the last issue of the Florida Grower as being most hopeful that complete eradication may be maintained.

Wilmon Newell, plant commissioner, state plant board, spoke on "How Will Future Protection Against Citrus Canker Be Insured?" In part, Mr. Newell said: "The campaign against citrus canker in Florida has been remarkable. Many people in the scientific world said the eradication could not be done. There is a vast difference between eradication and control—eradication means 100 per cent clear, and control might mean anything. It has been over a year since the plant board has had any specimens in the laboratory, which shows pretty conclusively that we are getting a strangle hold on canker. There was a wonderful cooperation from all in this battle—support was had from the government, the state, the individual, organizations—and last, but not least, the growers themselves made tremendous sacrifices. The citrus industry at the time represented in figures over $150,000,000, and to save this was a feat to be proud of. Eradication has shown what cooperation can do, and it is better to pay out now than pay toll for all time. The white fly could have been stopped as well as the cottony cushion scale if this method had been adopted on a small scale at their inception.

Frank Stirling, general inspector, state plant board, spoke on "How to Distinguish Citrus Canker from Other Diseases. "Every grower should know what citrus canker is, for it is a fact that there is always a possibility of canker being introduced into a grove." * * * Here Mr. Stirling called attention to exhibit of infected fruit, leaves and twigs. "Scab in its earlier stages resembles canker; but scab wrinkles the leaves while canker does not. Scaly bark also resembles canker, but the difference is that in scaly bark the bark is generally smooth, while in canker it is open and has a rough, crater-like appearance. Anthracnose also resembles it, but this has a sunken appearance, while canker is always raised and has biscuit-shaped pustules on twigs, leaves and branches. A tree affected by lightning shows at times the appearance of canker, but is never corky nor has the raised appearance of canker. It is very difficult to distinguish black melanose from canker, for the appearance does not differ much except that canker is larger, and melanose does not first open as does canker. * * *"

Tractor Men Meet

Pres. H. L. Marsh of the Traction Engine and Implement Dealers' Association of Southern California gives the following information regarding the last regular monthly meeting of the association, held Friday, February 28, at the Alexandria Hotel, with President H. L. Marsh in the chair. Two new members were admitted.

H. M. Bennett of the Pacific Whitney Tractor Corporation, when introduced, spoke briefly of the plans which his company were completing in order to participate in the tractor business in Southern California.

Ralph A. Spaulding, the new manager of the Bean Spray Pump Company for Southern California, was introduced as the successor to T. R. Henderson, who will carry the Bean to Australia.

During the business meeting, which followed the banquet, arrangements were partially completed for a large attendance of the Association members at the demonstration to be held by the Northern Association near Sacramento next May.

Discussion of a committee report regarding an additional appropriation for the work of the University agricultural engineering department at Davis resulted, as on previous occasions, in an enthusiastic endorsement of the good work accomplished by Prof. Davidson and the desire on the part of each and every member of our Association that Prof. Davidson's department be provided with more ample funds by the state.

During the discussion, mention was made of the large appropriation amounting to $100,000 or more which was made to cover the expense of the traveling tractor schools as a war-time emergency. It developed that while the various members of the Association appreciate in full the good work which has been accomplished by the traveling tractor school units, it was unanimously the opinion that it was a mistake in the arrangements of the traveling units to limit them only to tractors manufactured in California. Terminating the discussion, a resolution was unanimously adopted by the Traction Engine and Implement Dealers' Association urging the members of the state legislature, who have the matter in charge, to materially increase the annual appropriation to the department at Davis which has been so ably managed by Prof. Davidson in teaching the use of modern tractors and farm equipment.

RECOMMENDS HOGS ON FRUIT RANCHES

F. W. Gardiner, whose ranch is just south of Sacramento, finds that hogs fit in mighty well on a fruit ranch. Shortly after completing his course in the college of agriculture of the University of California, Mr. Gardiner assumed management of a rather extensive peach orchard.

"When I first went on to the ranch," Mr. Gardiner said, "I decided that there was no real good reason why I couldn't add to my profits by establishing a herd of hogs. My orchards were planted to alfalfa, thus affording plenty of pasture and of course I had more or less unsalable fruit. Then, too, I didn't propose to put all my eggs in one basket so to speak. After considering the matter carefully, I decided that Durocs were my preference, and naturally I knew that pure breds would be more profitable than common stuff. With pure breds, I have two outlets. I can market part of them for pork and can save out the tops and sell for breeding purposes. My plan has worked out very satisfactorily, and I find that it is now necessary to add more brood sows in order to take care of my increased business. There are hundreds of small fruit ranches in this state that should be carrying a few hogs, and I can assure the owners that they will find hogs a profitable adjunct."

At present Mr. Gardiner is carrying between 20 and 30 sows—most of which represent Model Col., Taxpayer, King's Col., and Burke's Good E Nough breeding. Tommy Tucker, by Viceroy 13th, is the senior herd boar and a young boar by King's Col. De Luxe is being developed for a junior sire.

Mr. Gardiner is negotiating with an Eastern firm for a sow bred to the noted Pathfinder.

Top Dressing Talks No. 8

California soils respond promptly and generously to intelligent fertilization. This is particularly true concerning nitrogen, in which important plant food so many soils are deficient. But as is always the case some one form of nitrogen is better than others.

Director Hunt of the Berkeley Experiment Station writes:

"Whether it is Mottle Leaf in orange trees, Little Leaf in peach trees or low yields of wheat, the cause appears to be the inability of the plant to secure and assimilate a proper supply of nitrogen."

Sulphate of Ammonia is mentioned by name among the various Nitrogenous Fertilizers recommended to overcome this deficiency.

Arcadian Sulphate of Ammonia

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in U. S. A., THE GREAT AMERICAN AMMONIATE.

The Easiest Riding Light Car Built

Correct spring suspension and proper weight distribution have given the GRANT SIX an unbeatable, world-wide reputation for ease of riding. People who have ridden in other lightweight cars are amazed at its superiority. Get a ride in the GRANT SIX. Prove for yourself that it is really a comfortable light car.

You will find the GRANT SIX has the most powerful overhead valve motor of its size ever built—that every part is accessible—that crank shaft and connecting rod bearings are extra large. In every detail this motor is finely built. It is now in its fifth season, refined and improved, with a splendid reputation for service and reliability back of it.

GRANT SIX owners average 20 miles to the gallon of gasoline, 900 miles to the gallon of oil and 7000 miles to the set of tires. Some do even better than this.

The GRANT SIX typifies the latest style ideas in body lines, in body colors, in upholstery and details of finish. The top has the popular "Gypsy" curtains with oval plate glass lights in the rear. It is made of best grade "Neverleek." The hood fits tightly and neatly on a handsome aluminum ledge. Every detail reflects quality. At the big shows everywhere the demand for the GRANT SIX has surpassed all previous records. For genuine value buy a GRANT SIX.

California Cultivator Costs $1 per Year

Labor Problem Satisfactorily Handled

One of the successful operations in handling the labor question of California was that of the Central California Fruit Growers, who formed the Valley Fruit Growers Association. The result last year was that crops were saved and vineyards and orchards kept in better condition than could have been possible without the association. It has now established headquarters at 1836 Kern Street, Fresno. Growers are urged to take advantage of the ability of this office to supply labor, and give assurance that all applications will receive immediate attention. The labor question does not exclusively engage this association, as may be observed by this quotation from the Sun-Maid Herald. The association has its eye on Washington.

Urge United States Aid

Showing the close touch the Valley Fruit Growers' Association keeps with legislative matters, the following telegram was sent to our representatives and the agricultural committee of the senate:

Washington, D. C.—California farmers deplore failure of house to pass department agricultural appropriation for continuance of farm labor work. No other federal department has shown ability to appreciate the special character of the labor problems that confront the farmers now no less than in the past. California farm labor agents' work has unqualified endorsement of the state commissioner of labor as well as that of all farmers. This, leading farmers' organization of California, dealing especially with labor and legislative matters, respectfully urges restoration of this appropriation.

Marketing Association for Figs

"The California Fig Growers' Association is the newest cooperative association of growers in California," says the Sun-Maid Herald. "Organization was effected under a resolution to incorporate at the Fig Institute at Fresno, February 15. The new association purposes to handle the fig crop cooperatively, and will complete organization on lines similar to those of the California Associated Raisin Company.

"The officers elected are J. C. Forkner, president; F. W. Yokum, first vice president; O. G. Brundage, second vice president; C. H. Cobb, treasurer, and E. Newby, secretary.

"The fig institute attracted hundreds of growers. In addition to hearing practical talks by growers and university experts, those in attendance were taken to the fig orchards for pruning, fertilizing, planting and tractor cultivation demonstrations.

Raisin Company Plan

"The resolutions for formation of the association follow:

"That the California Fig Growers' Association organize as an incorporation along the lines of the California Associated Raisin Company for the purpose of getting control, packing and marketing the figs in the state of California; that a committee of ten be elected by this meeting; that this committee of ten shall be the first incorporators of this new incorporation; that they shall hold their new office for one year; that they shall have complete power to incorporate and control the destiny of the new corporation, which shall be known as the California Fig Growers' Association, Incorporated, and that this committee of ten shall proceed immediately to incorporate and to endeavor to get enough fig growers signed up in this new incorporation to control the complete output of figs in the state, or the majority of it.

Committee of Ten

"To carry out the terms of the resolution the following were elected members of the committee of ten: O. G. Brundage, Farmersville; J. C. Forkner, Wylie M. Giffen and C. Cobb of Fresno; E. Newby, Reedley; H. G. Kelsey, Merced Falls; Fred Hansen, Clovis; Gill Summers, Ceres, and W. Sam Clarke of Sultana."

Fig Market Situation

The Fig Growers Association has issued a statement as to fig marketing conditions, from which we quote:

"The California Fig Growers' Association, at the present time, is not in a position to name prices for figs. It has no power whatever, except in an advisory capacity. Therefore, statements issued at this time by the California Fig Growers' Association, its trustees or its executive board, should be taken by fig growers in the state of California simply as advice and as having no other authority.

"During the formative period of the California Fig Growers' Association, it is the desire of the trustees of the association to render whatever service it is within their power, to the fig growers. Therefore, a statement will be issued, from time to time, during the spring of 1919, in regard to whatever information the executive board may have at hand.

"At the present time, the fig brokers of New York city are sending out letters advising the fig buyers in different parts of the United States and Canada not to buy figs at this time for they believe that fig importations from Smyrna will be made this year.

"Some fig packers in California are now offering the 1919 crop of figs for fall delivery, subject to prices at that time, no price now being made.

"At this time, this committee is not aware of any purchases or sales having been made at any definite or specific price.

"The importations of figs from Smyrna determine, to a very large extent, the price of California figs. If a large importation of figs should take place, it would no doubt have the effect of lowering the price of California figs this season. If no importations from Smyrna take place, or if but a small amount is imported, the chances are that the prices for the California figs will remain high during the season.

"This statement is given out so that each grower will be apprised of all the information there is to be had at this time.

"As soon as this committee is apprised of any information that would influence the price of figs, the said information will be published at once.

"In the meantime, the executive committee of this organization will proceed to perfect and complete its working machinery as rapidly as possible."

ROOT PRUNING CAUSES VIGOROUS REPRODUCTION

"It is well known that in many plants there is a marked antagonism between growth and reproduction. In such cases (especially in fruit trees) the reproduction of vegetative growth, e. g., by root pruning, causes vigorous reproduction. The study of the factors influencing these two processes is, therefore, of great importance. In higher plants, however, it presents great difficulties because of the close connection between the various external factors, none of which can be artificially modified without modifying others at the same time."—Blackman, V. H. (Imperial College of Science and Technology, London), in Science Progress.

Co-operation

NO one system of handling grain, or handling anything else, can be successfully carried out, no matter how advantageous it proves to be, unless there is a hearty co-operation among all concerned.

This co-operation starts at the source of supply and extends through every handling until the product is put in shape for the consumer.

Handling grain in bulk has been found practical, advantageous, profitable. The Government Grain Experts advocate it in California; the University Investigators believe in it because facts have proved it to be a big saving over sack handling; railroads are ready for it; every mill in California is equipped to handle grain in bulk, for they appreciate its profit and know the farmer will quickly see it, too, and change from his former costly method of using jute sacks.

Two things are necessary before the grain grower can give his willing co-operation in bulk handling. First, a storage bin on his own farm. The Calco Grain Bin meets that need. Second, a co-operatively operated, centrally located grain station at a railroad siding. The Calco Grain Loading Station meets that need.

Know as much about the Calco Grain Bin as your neighbor. Write for our free booklet. It tells about saving on handling grain.

Let us send you blue prints and estimated costs on a Calco Loading Station in your community—write for them today.

Other Calco Products

CALCO AUTOMATIC DRAINAGE GATE

Model 100

A SENSITIVE, reliable, water-tight, Cast-Iron Drainage Gate, automatically operated. it will drain and convert your flooded land into fertile fields. Diameters from 8 to 84 inches. Write for price lists.

All gates are supplied in connection with rust-resisting Armco Iron pipe in any length required. Replace the old, leaky structure which constantly causes you trouble and money.

CALCO SLIDE HEADGATE

Model 101

A WATER-TIGHT Cast-Iron Gate for reservoir or levee work. For use under heads of water up to 20 feet. Diameters from 8 to 72 inches—gate frame any height desired. Write for details and price list.

ARMCO IRON FLUME

Lennon Type

GET away from the old, expensive, leaky wooden flume. Armco Iron Flume is a water-tight, semi-circular, galvanized metal flume for conveying water—durable because made from rust-resisting Armco Iron. Simple to erect without skilled labor; greatest carrying capacity account of its perfectly smooth interior. Write for our flume catalog.

Learn the facts about "America's greatest farming opportunity

Our big, free, fully illustrated booklet tells all about this wonderfully fertile valley near Tucson, Arizona, where farmers are becoming rich. It contains signed statements by the actual settlers. You can write and verify everything they have said. Only 20 per cent of the food stuffs consumed in Tucson and adjoining mining districts is produced in the valley—the other 80 per cent is shipped in from California and other outside points. Local farmers command fancy prices for everything they can raise. Soil is deep, rich, silty loam; water supply abundant; climate ideal; no drawbacks, nothing but advantages. Land with water $150 an acre; attractive terms. Farmers, investigate!

For Deciduous Demonstration

The California Prune and Apricot Growers is urging the passage of a bill providing for the establishment of a deciduous experiment station. We have from the association the following statement of the provisions and aims of the bill:

Senate Bill No. 319, introduced by Senators Benson and Jones of Santa Clara County, is a measure appropriating money for investigation, research and demonstration by the department of agriculture of the University of California in regard to deciduous fruits and nuts, and reads as follows:

"Section 1. The sum of one hundred fifty thousand dollars, or so much thereof as may be necessary, is hereby appropriated out of any money in the state treasury not otherwise appropriated, to be used in accordance with law, for investigation, research and demonstration by the department of agriculture of the University of California, during the biennial period ending June 30th, 1921, in regard to deciduous fruits and nuts, including olives and figs, and to be expended for that purpose by the regents of the University of California."

A considerable committee, representative of several of our fruit organizations and farm bureaus, have interviewed university authorities and are confident we have now the staff in the agricultural department capable of administering this appropriation and securing results for all growers. Professor J. C. Whitten, who has recently taken charge of the department of pomology in the college of agriculture, will particularly supervise this work. His ability and his keen desire to build up the department may certainly be depended on. With the assistance of others of his department he has developed the following list of items requiring attention and it is planned that the appropriation, if secured, will be prorated in attention to these problems: Orchard surveys, modification of soil structure, irrigation of old orchards, water requirements and reaction of deciduous fruits, control of orchard diseases, control of pear blight, orchard insect control, investigation and application of insecticides and fungicides, land, equipment and management, a test of root stock, pruning investigation and demonstration, dried fruit investigation, fruit storage investigation, frost protection, utilization of wine grapes and culls.

All orchardists and other interested parties will be particularly furthering their own interests if they use their best efforts in recommending this bill to their representatives in the legislature. We are especially requesting favorable resolutions of growers' organizations, farm bureaus, granges, and others. We are expecting to shortly have a conference with the governor and board of control and hope to present at this time such unanimous and insistent demands on the part of all growers that will insure their favorable attention to our measure.

The item in the above list, covering land, equipment and management, does not mean the establishment of a large experiment station. It merely means the securing of plots at different points in the state on lease or otherwise, such as may be necessary in attention to the various problems encountered. Anyone interested in the details of the proposed work may make inquiry of our organization department. Through this department we have particularly cooperated with a Grower's Committee in a campaign to secure attention on the part of state authorities, including the governor, board of control and legislature.

1919 Market on Prunes and Apricots

NEVER were people guessing as to coming markets as they are today. The pessimistic take most gloomy views; others think that the reconstruction of the world will call for its greatest activities and greatest prosperity. The prune and apricot growers are asking as insistently as any other class of producers. H. C. Dunlap of the organization department of the California Prune and Apricot Growers Inc. authorizes the following statement after careful investigation of marketing conditions.

When we consider the offering of packers today we are inclined to congratulate ourselves on the success of our organization. Prunes purchased by the packers at 8½-cent basis or better cannot be used to open a cheap market in the trade, and we can have no repetition of the conditions that faced us in 1917. Previous to organization packers paid the growers the very lowest possible price. Today, in their efforts to convince growers of their good will and subservience to their best interests, they are most certainly offering the last fractional value conceivable. Their present activities cause us to recall to mind a similar condition last spring, when packers' offerings bid up the growers' price to an apparently most attractive figure. At that time a number of conservative (?) parties in San Jose considered it advisable to promote such selling and advised growers accordingly. This season, as at that time, we have refrained from all speculation as to prices, in the same manner as we refrain from actual speculation in selling. Such deals are absolutely a gamble and it was the purpose, in the formation of this organization, to take the grower and his crop out of such a market. No one could more easily disqualify himself as a servant of this organization than by foolish remarks in this matter. If the trade in the east will buy futures in the 1919 crop at a price warranting packers' present offerings, they will continue with same up to such time as the price develops beyond the possibility of profit. In any case, they will accomplish their purpose, namely the development in the minds of growers of a hesitation detrimental to our efforts in securing members.

We can only say at this time that our organization will have most economical and efficient manufacturing and sales departments for the handling of the coming crops, and our economies will put us in a position to secure for our members the very best available legitimate prices. We will have an absolutely clean market, and brands of unquestioned quality maintained by the Association this season will have a value not to be compared with the offerings of any competitor. We will have for the first time in two years past, in addition to an excellent domestic demand, an export trade clamoring for our products. The trade has never been interested in the early purchase of futures, except at most conservative prices. Any purchases they may make today warranting the packers' present offerings give us excellent assurance of market prospects. The grower who sold early last season speculated and apparently secured a very good price. In prunes he would have lost had not the food administration persuaded packers to make good with him.

As Association growers we may for the future confidently anticipate that our returns will be not necessarily 8 cents or 9 cents basis on prunes or 12 cents or 16 cents on apricots, but a figure better than the average secured by growers selling independently of the Association. Again we ask you to be a booster and assist us in securing the greater control of 1919 production that will make us all the more a power in the naming and maintaining of prices to which we are entitled.

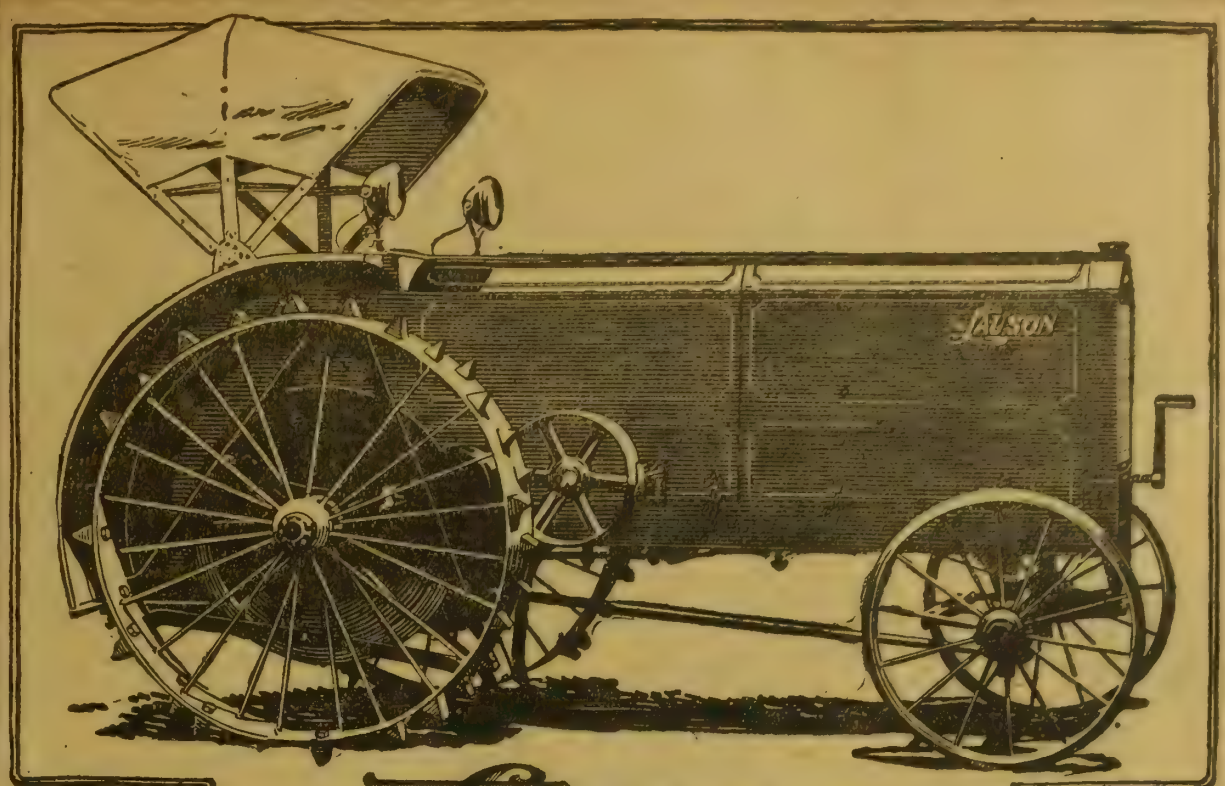
Application to Apricots

Practically every condition mentioned in this article, and most especially the advantages of export resumption apply and will hold good for apricots. Barring embargo, England will be again in the market for the canned product and Scandinavian markets will with others be a bidder for the dried fruit. The competition between dried and canned markets should insure good returns to growers. The ability to dry puts a grower

in a position to take or refuse a cannery offer. An improved dry market will surely be appreciated.

In the wild scramble of packers to buy prune crops remaining without the Association, a 9-cent basis is now being freely offered, especially in districts where the campaign has developed the competition of the several independent packing concerns remaining in the field. In their efforts to impress growers with the attractiveness of prices offered they are making most rash and illogical statements. They are stating that they have already made vast purchases and so filled up the trade in the east as to make it difficult for the Association to interest the trade at a comparative figure. In the first place, outside of possibly the Southern San Joaquin districts, they have not made any particular purchases of fruit from independent growers. In Tulare and Kings Counties, due probably to isolation of independent growers and their lack of knowledge of conditions, packers have purchased prunes produced by non-Association orchardists. In Santa Clara and elsewhere they have, of course, made some purchases, especially from growers desiring to secure advances. Such growers have at all times been inclined to early sale and have in the past thus established most unfortunate markets for the industry.

Their statements in the matter of having surfeited the trade, making Association sales difficult at a later date, are certainly wild and illogical. The wholesale and jobbing trade is in the hands of grown-up men with some ability to do business on a business basis. The trade does not purchase its full requirements at such an early stage of the game, and whatever purchases they do make are in their estimation at a figure most attractive. If they have purchased largely at the present prices they consider themselves fortunate, and do so for the reason that they fear an advanced market at a later date. If they considered possible crops liable to bring out a lower market, they would be most conservative in the matter of buying.



GROW FRUIT STOCKS

The soils of France and America, as well as the souls of those two countries, have been blended—literally.

The most notable instance of the incorporation of American soil into the soil of France was the taking to France of several barrels of American earth in which to bury the body of Lafayette, but French soil has been incorporated into American soil in literally millions of places. Probably every county in the United States has its admixture of French dirt, and it is scarcely too much to say that some particles of it have found their way to practically every farm throughout the length and breadth of the country.

How did it come? On fruit stocks. The aboveground portion of your fruit trees may be pure American, but the underground portion is very likely to be foreign. With the exception of the apple and peach, most of the seedling plants on which grafting or budding is done are imported, and even with the apple considerable progress has been made in producing American grown seedlings. From imported French seed many nurserymen have thus far preferred to import apple seedlings from France and to pay more for them. Just now, however, rather determined attention is turned toward a solution of the problem of fruit stock production in this country. All of the peach stocks are now home grown from seeds produced in this country.

"We are beginning to appreciate more and more," says one of the plant pathologists of the United States department of agriculture, "that our future successful fruit culture is intimately associated with the problem of stocks. With the exception of the grape, no far reaching studies have been made on stocks in this or any other country. We have followed certain empirical practices in the past, but as competition becomes greater and the demand for the highest grades of fruit and plant products increase, we must know more of the actual relation of stocks to quality of product, to the length of life of the tree or plant, to adaptability to soil and climate, to resistance to disease and insect attacks."

The LAUSON 15-25
DUST PROOF-ALL GEARS ENCLOSED

TIME FOR TIME

The farmer will not buy over one or two tractors in a lifetime if he buys wisely. When you buy, you should buy a good tractor like you buy a watch. You ought to know by your tractor that your work will be done on time and all the time, just as you know by your watch the time of day. A tractor out of commission is as useless as a broken watch.

The LAUSON 15-25 is the result of over 30 years manufacturing experience and understanding of conditions under which a tractor has to work.

Like a good watch the Lauson is built dust proof, all the gears being completely enclosed. Nothing prolongs the life of a tractor more than good lubrication, so all the gears and other important working parts on the Lauson run in fine bearings and a bath of oil.

The Lauson is "full jewel." There are 24 Hyatt and Timken roller and ball bearings to insure easy running.

Tractor experts call the Lauson the "Pattern Tractor" because it is a tractor after which many other manufacturers have modeled their machines.

Read these specifications and then call on the nearest Lauson Sales and Service Station to make a demonstration on your farm.

The Killefer Automatic Double Disc Harrow

AUTOMATICALLY STRAIGHTENED

The small cut shows the Automatic Double-Disc Harrow, automatically straightened. To accomplish this, the tractor is backed up until the hook on the draw chains can be placed in the hole on the front end of the adjusting swivel; then, by going ahead about 18 inches, the disc is drawn straight. To set for working position again, pull out the hook and go ahead. This can all be done by the driver from the seat of most tractors.

Killefer Quality

A REAL TRACTOR DISC

This DISC HARROW is built especially for tractor work. Every pound of material in it is in working parts.

It is an Orchard Disc, and a Field Disc, that has never been excelled. It is low down, strong, durable, and the adjusting feature is very simple and positive.

Any position from straight to almost a plowing angle may be obtained. This is all done by the tractor.

We use a very heavy disc and heavy material throughout, well braced and hot riveted.

Built in all sizes from 5 ft. to 12 ft.

This Disc, along with our complete line of Tractor Tools, will be demonstrated at the Tractor Show to be held at Sacramento May 5th to 10th.

Planet Jrs. increase your production and lessen your cost

You get bigger and better crops with less expenditure of time, labor, and money, for Planet Jr. tools enable you to cultivate easier, quicker, and more thoroughly. They are time-tested tools, so careful, accurate, and substantial in construction that they last a lifetime. Fully guaranteed.

No. 90 Planet Jr. Twelve-tooth Harrow, Cultivator and Pulverizer is a prime favorite with farmers, market gardeners, strawberry, sugar-beet and tobacco growers. Its twelve chisel-shaped teeth and pulverizer leave the ground in the finest condition. Adjustable to both width and depth, making close, fine work easy.

No. 90

No. 25 Planet Jr. Combined Hill and Drill Seeder, Double and Single Wheel-Hoe, Cultivator and Plow sows all garden seeds from smallest up to peas and beans, in hills or in drills, rolls down and marks next row at one passage, and enables you to cultivate up to two acres a day all through the season. Straddles crops till 20 in. high, then works between them.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Probate on Personal Property

If husband and wife file joint declaration of homestead upon real property, in case of the death of the husband, will bank account and bonds also go direct to the wife without probate? The personal property stands in the husband's name.—Subscriber, Pajaro.

The declaration of homestead affects the real property only and a court proceeding is necessary to establish the fact of death of record; this is inexpensive, however. As to the personal property regular probate proceedings must be had.

Tax Title

I hold tax title on land bought from the state five years ago; the state held the land five years before my purchase. The land was patented about 30 years ago but the former owner is dead. Is a Torrens title as good as any other? Will an abstract company insure my title? Is it possible for me to take the usual action to quiet title?—Subscriber, Calexico.

Title companies are very loath to insure these tax titles. The procedure of the Torrens title act is especially advantageous in the matter of tax titles and would doubtless be as good a procedure as you could take in this case; although the usual action to quiet title on the ground of adverse possession might be brought; the former owner being known to be dead would make some complications in this action which doubtless would not arise under the Torrens procedure. The Torrens tite is guaranteed to be good by the state after a judgment declaring it to be good and should be better than any mere certificate given by the average small title company with small private resources.

Home Must Be Probated

Husband and wife own home paid for from their joint earnings; the title is in the names of both husband and wife; the husband has died and there are no heirs other than the wife. In case she wishes to dispose of the property what must she do?—Subscriber, San Jose.

The husband and wife are what is known as tenants in common, each having an undivided interest, according to the presumption of law. The property is community property and the estate must be probated in the usual way.

Payment for Magazine

I subscribed for a magazine about two years ago but found I could not keep up the payments and wrote to the company and asked them to cancel it. They discontinued sending it to me. Lately they have placed a bill for two years' subscription in the hands of a collector. What are the rights in the matter?—Subscriber, St. Helena.

It is doubtless some error in the books of the company. After making a contract of subscription you are not entitled to change your mind and the company could have held you to the contract, but as they stopped their publication on your request the original contract was annulled by mutual agreement, so you are not liable.

Removal of Telephone Poles

In 1911 I purchased certain land upon the south side of which a telephone company has a line of poles placed with the consent of the previous owner without written contract. I now wish to have the pole line removed. What form of notice should I give them and in the event of their refusal what form of action should I take?—Subscriber, San Bernardino.

Having had their line in place for over five years it is possible that a right has been acquired. In any event, you might render yourself liable for damages should you chop the poles down. You should notify them to remove the poles within a certain time, describing the property so they will know it and inform them that unless said poles are so removed that you will take action to enforce the removal. In case they are not removed, then you could doubtless bring an action in the form of trespass and ask for the removal by order of court.

Use of Road

There is a public road along an irrigation ditch; the property line of the westerly owner is six feet east of the east ditch bank; the tenant of the property on the east of the road claims to have the right to stake his cattle throughout the road against the claims of the westerly owner. What are the rights of the parties?—Subscriber, Butte County.

If the public or county has title to the road by purchase of the land there are no rights in either party, except with the consent and order of the board of supervisors. If the public or county was merely granted a right of way over the land for road purposes then the owners of the land remain such for all purposes not inconsistent with those of traffic and they can graze their cattle and plant the roads up to their old property line or to the edge of the traveled road and only so far. If anyone not owning the property should attempt to use it the owner thereof could bring action for trespass.

CALIFORNIA BEAN PRODUCTION BY VARIETIES IN 1918

By E. E. Kaufman, Field Agent, United States Crop Estimates.

Owing to the importance of the bean crop and the difficulty experienced at harvest and thrashing time in many sections of the state on account of unseasonable rains, a special inquiry was instituted concerning the probable production by varieties, together with average "pick" and quality of the crop. Further data on the acreage harvested and average yield per acre was also secured.

The acreage harvested is estimated at 592,000; no change being made from the December figure. The average yield per acre is reduced from 15 to 14½ bushels, making the revised figures on production 8,584,000 bushels—equivalent to 5,150,400 centals. The quality of the 1918 crop was only 85, compared to 97 in 1917. The average "pick" (trash, split and otherwise defective beans) was 10.5 per cent in 1918, compared to 4.3 per cent in 1917. In some counties the "pick" was exceedingly heavy, on account of rain, while hardly any district entirely escaped.

Following is the estimated production by varieties in centals, or 100-pound sacks: Limas, 1,545,000; Small White, 978,000; Large White, 618,000; Pink, 721,000; Red Kidney, 26,000; Black Eye, 463,000; Cranberries, 103,000; Mexican Reds, 154,000; Bayos, 118,000; Teparys, 257,000; Henderson Bush, 134,000; misccellaneous, 33,000.

SAN JOAQUIN VALLEY COTTON

Cotton men of the San Joaquin Valley have pooled interests to the extent of 100,000 pounds of long staple. S. P. Frizelle of the marketing committee has charge of sale of the crop.

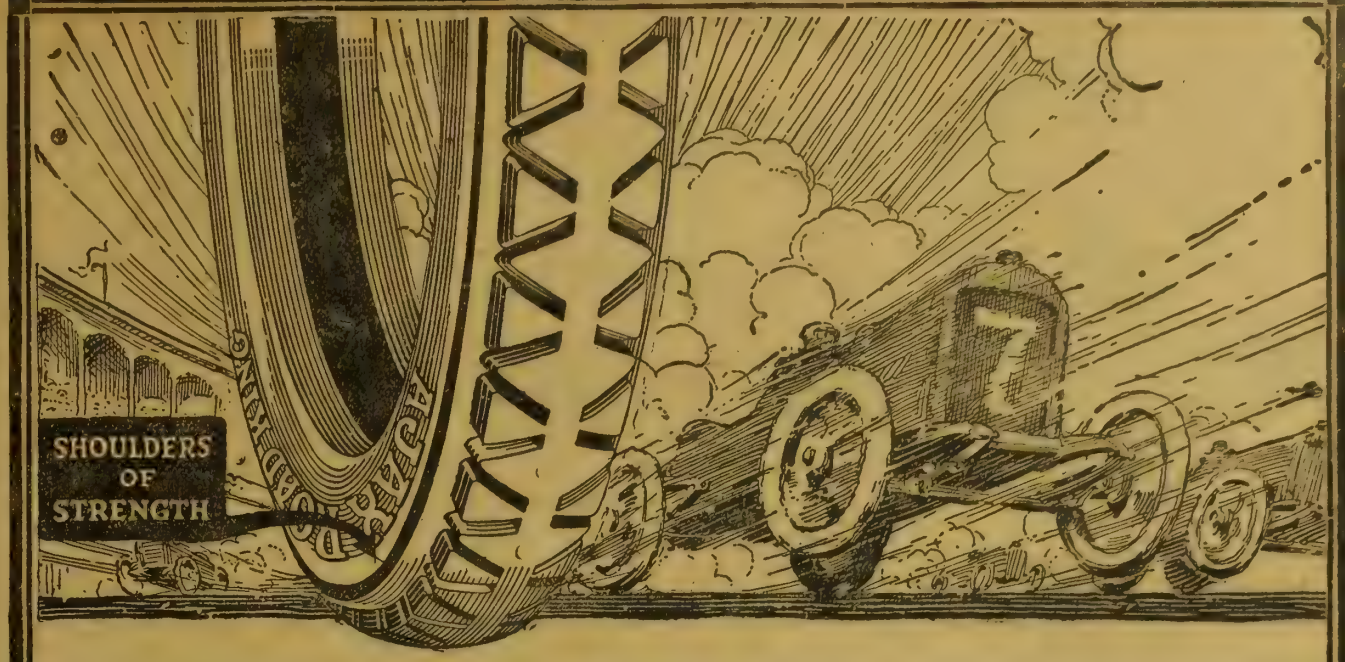
DOMESTIC PRODUCTION OF POTASH

Statistics of the production of potash in the United States in 1918, which are complete except for reports from some of the smaller producers, show a large increase of output. The returns now at hand indicate a total production of 192,587 short tons of potash materials containing 52,135 short tons of actual potash.

The production in 1918 was almost double that in 1917. About 75 per cent of the total output came from natural brines, 55 per cent coming from brines in Nebraska alone. Most of the product was in the form of mixed salts and fertilizer materials containing from 20 to 30 per cent of potash. About 24 per cent of it was in the form of muriate and about 6 per cent in the form of sulphate.

For several years immediately before the European war the United States used annually an average of about 240,000 short tons of actual potash. The production so far reported in 1918 is therefore about 22 per cent of our normal consumption. The imports during 1918 were very small. The producers reported that on January 1, 1919, they had in storage 60,426 tons of crude potash, held because of the dull market prevailing during the later part of 1918. These figures represent a minimum, as some producers did not give quantities, but stated they had produced considerably in excess of sales. Most of the potash now held in storage was produced when the price was high, when quantity production was the main object, and when competition with foreign potash was not considered. The price now offered for that material is apparently below the actual cost at which many firms produced it, consequently there is a crisis in the domestic potash industry. Many producing plants have already shut down and others are marking time.

The producing capacity of American potash plants, classified according to sources of raw materials, is estimated roughly as follows: Natural brines: Nebraska lakes, 50,000 tons; other sources, 28,000; alunite 4000; dust from cement mills, 3500; kelp, 5500; molasses distillery waste, 4000; Steffens waste water, 3000; wood ashes, 1000; other sources, 1000, or a total of 100,000 tons.



This quantity corresponds to more than 40 per cent of our normal consumption and indicates what may be produced in the United States during 1919 provided the American producers are able to compete with the foreign producers.

W. S. S.

Purchasers of 1919 War Savings stamps should not place them on 1918 folders—technically known as War Savings certificates—is the warning of Samuel Hubbard, director of War Savings for the twelfth federal reserve district. If the 1918 certificate has blank spaces just put the certificate away without filling it with 1919 stamps.

The same thrift stamps and thrift cards are used this year and when the thrift card holding 16 stamps is filled it will be exchanged for the 1919 War Savings stamp on payment of the additional cents which represent the difference between the price of the War Savings stamp and $4, the value of the 16 thrift stamps.

The Arizona legislature has passed a resolution calling upon all boards of supervisors in the various counties to initiate public works as soon as possible to relieve as far as possible the condition of unemployment.

AGAIN-
AJAX WINS!

AJAX Tires—for the second consecutive year, are crowned champions of America's dirt tracks. Gruelling, grinding contests at state fairs all over the country again prove why Ajax Tires stand first in favor with the farmer.

58 Championships For Ajax

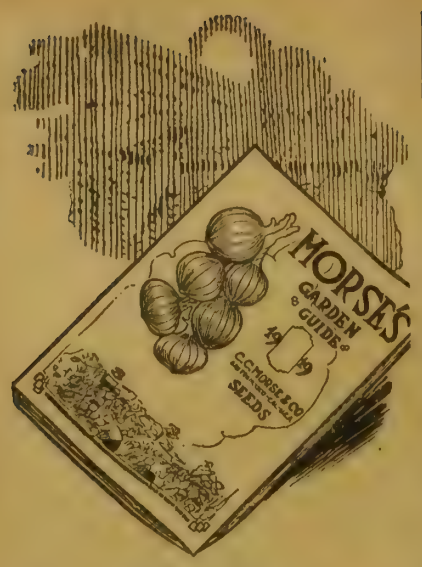
Nine World's Championships—49 Track Championships, were won in 1918 by demon auto racers using Ajax Tires. Ajax Tires swept the field in many races. They outstripped competition on dirt tracks. They stood up and won under severest service.

Ajax Tires—the same tires that won 58 great championships in 1918—will give you the same good service they give the dirt track racers. Remember this: they win on the roads you drive on. The dirt track is a country road with a fence around it.

AJAX ROAD KING

MORE TREAD ON THE ROAD

Ajax Tires win because of greater inbuilt strength. They alone have Shoulders of Strength. See the shoulder in the picture. Note how it braces the Ajax Road King tread. Shoulders of Strength give the Ajax Road King more tread on the road, more strength where strength is needed.



Buy Ajax Tires at your nearest Ajax Tire Supply Depot.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Ear Tags

I have some pure bred hogs and would like to get some ear tags, but do not know who handles them.—Subscriber, Oxnard.

Any dairy supply establishment advertising in the Cultivator can supply these tags.

Broom Corn Thresher

Please tell me what thresher is the best for broom corn, also the name of the manufacturer and the price.—Subscriber, Calexico.

These threshers are usually home made and are very crude, consisting of a wooden cylinder in which spikes are driven, spaced very much as the "teeth" in the grain thresher. However, farm machinery advertisers in the columns of the Cultivator may be able to supply these threshers.

Home Made Cheese

Can you give me the recipe for making the ordinary store cheese which is called sharp?—Subscriber, Chula Vista.

Directions for the making of cheese are rather too extended for giving in these columns. The Cultivator of August 17, 1918, has a general article on the subject of making cheddar or perhaps what the subscriber means by "store" cheese. The "sharp" or stronger cheese is secured by aging the cheese, also by using certain cultures which call for more skill in handling.

Suffocating Squirrels

Is it possible to kill squirrels by the use of distillate? If not, which is the best poison, wheat or barley?—Subscriber, Red Bluff.

Yes, though it is so much slower in vaporizing than gasoline or carbon bisulphide or the proprietary substance known as Kilmol, that these are usually preferred. Balls of old rags or waste are often used, being saturated with one of these substances and inserted into the hole which is then closed.

Rations for Hogs

Does it pay to feed barley to hogs running on alfalfa, or will they do well enough without it? Have asked this question of a few hog raisers who make quite a success of feeding fall pigs some grain through the winter, turning them on alfalfa without any grain until fall and then finishing them with grain. Would it pay to grind alfalfa hay fine, mixing with it a small proportion of grain, or is it better to let them harvest the alfalfa, saving expense and trouble? If barley is ground is it better to soak it or to feed dry? If soaking is best should it be allowed to sour?—Subscriber, Willows.

Yes, it does pay to feed a small ration of barley to hogs running on alfalfa. Careful tests have shown that a balanced ration for growing pigs makes for enough more rapid growth to justify adding grain to pasturage. Tests made at the Kansas experiment station have shown that hogs kept exclusively on that best of all hog feeds—corn—show least thrift and vastly less growth than hogs kept on alfalfa with small addition of grain feed. Regarding grinding alfalfa it is a question of economy and cost of labor. If hogs are pastured there is saving of labor but waste of alfalfa. That is, the production per acre is much less than where the alfalfa is cut and fed. Again, if made into cured hay and ground the labor increase and the availability and amount of food produced must be considered. Wastage of the stem or coarser parts of the hay is not so great as where ground or finely chopped. The feeder must keep in mind that grinding in no way increases actual feed value but does lessen wastage. We would like to hear from hog feeders who have made tests of these different methods of feeding. Careful investigations have shown a slight increase in feeding value of soaked grain over dried grain. In fact this is reported to be only 2 per cent. The increase in value is more pronounced with old stock than with youngsters. Grinding, or rolling, however, especially of small, hard grains such as barley and rye, does prove beneficial. If soaking is done do not let it sour.

Egg-Eating Dog

In the issue of March 1, I notice that J. H. Armstrong of Stockton wants to know how to cure a pup of eating eggs and thinking perhaps my method might help him I am sending it. We had a very intelligent shepherd pup five or six months old. When he began eating eggs I think at first he just played with them as all puppies play and found they tasted good. Whipping did no good as he was too young, so the next time I found him with one I called him to me and took it from his mouth. I did not dry it of the saliva but very carefully tapped the end, let out some of the white and put in about a teaspoonful of Watkins' Liniment, which is very hot and burns the tongue. I then very carefully pasted a piece of paper over the broken shell and called the pup to me, let him smell his egg and when he opened his mouth to take it I simply shut his jaws on it, crushing it instantly. The liniment burned, so he rolled and howled, but to this day if I show him an egg his ears and tail drop, and he is now five years old. It is well worth trying if one has a good dog.—Mrs. H. C. Wallace.

I found this article in March 1 of your publication and as I am a dog lover thought it worth while to tell my experience. Make a hole in both ends of egg, blow out contents, then cover one end with a piece of paper dipped in white of egg. Make small funnel of paper, place in open end, then fill funnel slowly with cayenne pepper, letting it go in egg, then close egg with piece of paper. Place egg where young dog has been accustomed to stealing them. One egg is usually enough.

If a dog catches young chickens, take the chick, hold the dog firmly and pick his nose with the beak until he whines. Take the chick's feet and scratch his stomach hard until the claws have made marks on the bare skin, all the time scolding him by saying: "You are a bad dog, a naughty bad dog!" The smell of the chick, the scratching, and scolding, make a lasting impression upon his canine mind. I broke one dog in one lesson. Don't whip!—Mrs. J. W. Lyon, Gardena.

Grafting Walnuts

In the foothills of the Burro mountains of New Mexico I have 640 acres of grazing land on which are 50 to 100 walnut trees bearing regularly small black walnuts, not large enough to market. On the other side of the mountains is a ranch where grafting of English walnuts proves very successful, I have heard. These are large hardy trees, and I wish to graft English walnut branches on them if it would be practical to try. How soon do trees bear after grafting? Should

The Cultivator co- only one dollar yea-

they be pruned when grafted? How many grafts should be given each large tree? What time of year should the grafting be done? Are grafts placed high or low, preferably? Is it best to use grafting wax? If so, what kind and where obtainable? If grafting wax is not used how is the graft held in place best? About how long should the branch grafted on be? What variety of English walnut is best to graft in this climate, dry most of the year, high altitude, late frosts, trees supplied with moisture from the creek beds, mainly, along which they grow? Please describe the way the branches should be cut which are grafted on and those to which they are grafted. What place can supply what I would need of the variety best adapted of branches to graft and how should I order? What firm is most dependable?—Subscriber, New Mexico.

Be sure and use the grafting wax which may be made according to any good formula, one of which was given in Mr. Neff's article on page 239 of the issue of the Cultivator of February 22. Also see the article on caring for the grafts when once they start, in this week's issue. We believe these two articles will answer all other questions. The scions must have at least one full healthy bud. As to the variety which will do best in New Mexico we can not say at this distance, but presumably it would be of the Franquette or Mayette type. Would suggest the securing of scions from trees known to do well in your own state. Without question your native small blacks will make good stock for grafting on the improved walnut.

Rye for Hay

What is the proper time to cut rye for hay? How soon may cows be pastured on it?—Subscriber, Exeter.

If rye is to be used for hay it should be cut when the grain is in the "dough." Some prefer to cut while in the "milk." Rye will stand for liberal pasturage if done early and before any indication of heading out.

Getting Rid of Stumps

In reply to a question from Marin County as to an easy method of getting rid of stumps (pine, Monterey cypress and eucalyptus) near building, without using dynamite, stump puller or digging out, Jas. D. Seaton of Red Bluff writes:

If stumps are not too close to building bore a hole in each near the ground and use small charge of black blasting powder to shatter them, but if not used to blasting bore a two-inch hole in top of stump down 18 or 20 inches, and another hole from side of stump to meet first hole at right angle at or near bottom. Insert live coals from the top and a few dry chips from stump made by auger. Blow in bottom hole to make fire start, and put in more chips, and, presto, there is no more stumps in a few days. Green stumps (pine or fir) will burn as well as dead ones, if they have any heart. If the first method is used split stumps in quarters and pry out pieces with crowbars. Burning is easiest.

COSTS, BUT IT PAYS

The California Associated Raisin Company has made provision in its budget for 1919-1920 for the expenditure of $440,000 for advertising and sales purposes. The appropriation slightly exceeds that of last year when about $385,000 was voted. There will be somewhat more national advertising in standard magazines and some new advertising in the trade press. A fund was set aside to be used in foreign advertising if this step is found necessary to dispose of part of the coming crop.

APPLIANCES FOR STORING GRAIN

The high cost of sacks is aiding materially in advancing the bulk handling of grain, and this is encouraging the construction of equipment which is making much more satisfactory this bulk handling. It is pointed out that metal grain bins of high quality, rust-resisting metal are comparatively inexpensive when the saving in grain and labor costs is considered.

Expect Less and Get More From Your Tractor

By C. L. Butler.

BY taking a short cut off the line of least resistance we can speed up the success of the farm tractor. The same goal may ultimately be reached by simply letting the farmer find the facts for himself from his own observations, but it is a tedious —yes, dangerous—process. There is the possibility that his findings, if gained without instruction, will be too bitter and he will turn his back on tractor benefits. Tractor manufacturers should not run the risk of letting him go this hazardous way unguided. We can bring the tractor into its own by producing the plain and unadulterated facts and insisting that every user get them before he gets his tractor. The most unsatisfactory buyer in the world is the farmer who expects too much. His tractor so purchased is bound to be a liability to himself and the company that built it. It makes no difference how good a machine may be, if the farmer thinks it should be better he will not be satisfied—and unsatisfied he is a liability on the books of the tractor agent. The mistake made is in permitting the farmer to expect too much. Today's sales may come easier; they may be even forced to greater increase by fanning the already high hopes of the buyer by a little sales eloquence. It's a crime. There will be a morning after.

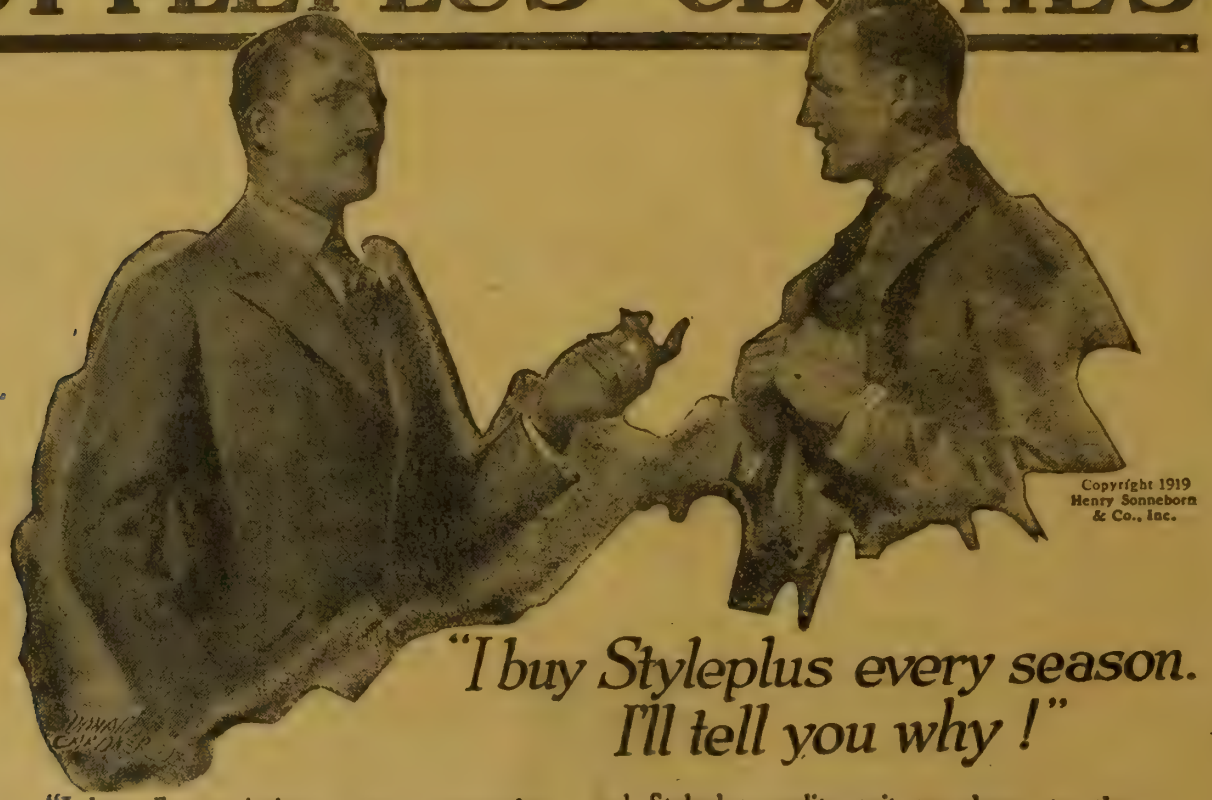
It is not sufficient to leave out the untruth—and the Lord knows George Washington's blue pencil would shorten most of our statements. It is vital that we go farther and tell the truth—and most of us unfortunately must first learn it. Our job in this tractor industry, our short cut off the line of least resistance, is to conscientiously learn the facts and then rush them forth to the farmer. We cannot talk too loudly nor too eloquently about the facts, provided they are the real facts and not distorted. My mother used to tell me to always tell the truth, but that I need not turn myself inside out to do it. I'll go her one better; I'll say to the tractor industry, "Until the truth becomes better known about the tractor, turn yourself inside out to tell it." The farmer must be convinced, in spite of himself, that a tractor motor must be measured in revolutions, not years, and that a tractor will pull so many pounds at the drawbar, not necessarily so many plows. We can best serve the farmer by teaching him to serve himself. And he will only be able to serve himself when he recognizes these facts about his tractor.

Let's take this matter of pull at the drawbar. After all is said and done, that is all the tractor man has to sell, and if it costs too much, he won't be able to continue selling it. Most tractors are sold to pull so many plows. "Capable of pulling two 14-inch plows at all times: three 14-inch plows under favorable conditions." You have all seen similar statements. Outside of the fact that it gives the farmer a wrong impression, it is quite a liability for any manufacturer to set up. The owner may take it too literally and his lawyer insist that the agent live up to what is practically a guarantee. There are too many factors to be considered to encourage such statements from a cautious industry. We are selling drawbar pull and we had better distinguish between salt grass and loose loam.

The farmer must realize that the biggest part of making the tractor a success lies with him. The industry should do all in its power, in its advertising and in its sales policy, to let him know it. He is buying drawbar pull, which in itself will vary greatly in relation to the traction available—and drawbar pull may mean three fourteens and then again it may not be enough for one. The lay of the land, the soil, the growth in it, the suitability and condition of the plows, the hitch—they are all important factors. Any one may change the pull two or three hundred per cent.

When the agent sells a tractor he invariably turns it over to the farmer to pull so many plows on his ranch. Probably he took his demonstrator out and did a little plowing. Of course his plows were suited for his tractor, his shares nice and sharp, his hitch just right. That is all in order. A man would be a sucker to drag a dead load on a demonstration. But when he left the tractor, did he leave a word of caution with it? Did he build up a defense for the change of conditions, tell the farmer that it would take him a long time to run things as smoothly? Perhaps you, as a tractor agent, can remember the time it took and the grief you had getting your plows lined up to give real service and to turn the land with a minimum pull on the drawbar. Why not get the farmer ready for the same grief? He is going to have it, sure. Whether or not he has the patience to tolerate it is up to you. He will if he anticipates it, and it is up to the dealer to get his mind right. It takes time, even for experts, to adjust a plow properly behind a tractor.

The day the farmer gets his tractor he hooks on to the old plow he was using with his horses because the new one for the tractor hasn't come. Most likely it is too heavy a load. He bought his tractor to pull 3 twelves—furthermore he can't understand why it won't do it. If he had a drawbar scale, could see that the tractor was pulling every ounce it was supposed to pull, he might feel better. But in his mind 3 twelves is 3 twelves. The horses pulled it, why won't the newfangled contraption do it too? So long as he starts that way there is trouble ahead. He bought the tractor to pull the bottoms, but he makes no allowance for the fact the hitch may double the load he is pulling. Most old style horse drawn plows are anchors behind a tractor. This little incident made him sore; had he recognized the difference in the pull he might have felt better.



Next he gets the new plow. He hooks it up after considerable difficulty and away he goes, ready to forget and forgive. And again the tractor only handles the load with unquestioned effort. This time the scar on his patience is pretty deep, new plow, nice and sharp, traction good, soil in perfect shape— what's the use? But he overlooked the fact that the plow didn't set quite square with the pull. Here again he was disgusted because he recognized no difference between plow bottoms and drawbar pull. He would have been all right if he could have seen a drawbar scale and realized that even so little a thing as an off line pull may double the work for the tractor.

It is always that way. There may be nothing the matter with the tractor, but the load is not right. There is not one farmer in a dozen who can understand why his tractor stalls on a little morning glory patch or a bit of Bermuda. His horses always walked through it. True, they leaned into the collar, but they never stalled. Right there is the difference. Drawbar pull with horses can be very greatly increased for an instant. They can "lean in" through a tough place but they could not carry the load that way all day. The tractor is not quite so flexible although it can take its proper load on the drawbar for day after day without complaint. It is up to the man selling the tractor to let the farmer in on this secret; if the pull is too great the tractor won't pull it regardless of whether it is three bottoms or only one. And the difference in pull in a single round even on an apparently uniform field is very marked.

If the farmer hopes to have success with his tractor, he must have the patience to get things right and the ability and determination to keep them right. If he understands and properly cares for his tractor, it will always pull its load in pounds on the drawbar. If the implements are suited for the work, kept sharp and in condition and properly attached the work will go on without any grief. The operator is 60 per cent of the success of his tractor.

The tractor sales policy that educates its salesmen and its owners to expect less and know more of their tractor will be the first to cross the line a winner.

STYLEPLUS CLOTHES

Copyright 1919 Henry Sonneborn & Co., Inc.

"I buy Styleplus every season. I'll tell you why!"

"I buy all my clothes at one store—the Styleplus Store in town. The advantage is that each suit has the Styleplus label in the collar, the price label is put right on the sleeve by the makers, and they guarantee the clothes.

"See the point? I *know* the manufacturer is back of these clothes and they *must* be good. I *know* that the price is right. Styleplus style and Styleplus quality suit me down to the ground. The prices are always reasonable.

"I never buy a suit of clothes without seeing it first and trying it on. Then it fits right and I get just what I want.

"Be a Styleplus 'regular' and your clothes troubles are over. And you'll always get your money's worth!"

Running a Gas Engine

Farmers Bulletin 1013, U. S. D. A., gives some valuable hints regarding handling gas engines. Here are three:

Use All Information Furnished By Manufacturer

All catalogues and directions furnished by the manufacturer should be studied carefully. If none are received with the engine, a request for them should be sent promptly to the manufacturer. It is to be regretted that a few manufacturers are rather lax in the matter of furnishing such material, although it is obviously to their interest to make use of this comparatively inexpensive method of assisting the purchaser to obtain satisfactory service from the engine.

Any instruction book furnished by the manufacturer should be kept in a safe place, but convenient for reference. It is safe to assume that the man who made the engine knows something about its operation and can give some information of value to the purchaser. In altogether too many cases, the instruction book and other literature intended to be of assistance to the user of the outfit are either thrown away or ignored completely, and not infrequently a man is sent from the factory, or a local expert is hired, to make simple adjustments concerning which full instructions are given in literature furnished by the manufacturer but which had never been read by the owner.

Lubrication

A large percentage of repair expenses is due to insufficient or improper lubrication. In far too many cases owners of gas engines use grades of oil entirely unsuited to their engines, notwithstanding the fact that in each case the manufacturer has furnished a long list of various brands and grades of oil which have been tested and found suitable to the engine in question, and which can be obtained practically anywhere in the country.

Another common error is to use too little oil. It is poor economy to try to save on oil. On the other hand, an excess of oil in the cylinder, while better than too little, will cause carbon deposits, followed by loss of power, overheating, and preignition. Heavy, bluish smoke from the exhaust indicates that the cylinder is getting too much oil, but it is usually advisable to furnish enough to give at least a slight trace of bluish smoke.

If the cylinder is oiled from the crank case by the splash system, the lubricant being used over and over again, the oil should be examined frequently, and as soon as it becomes badly discolored or very thin it should be drained out and new oil substituted. Many manufacturers furnish directions as to how often this should be done. Filling the crank case with kerosene after draining out old oil, and then running the engine a few minutes without load, in order to remove dirt and carbon from bearings and other parts, is frequently recommended. This is good practice where the crank case can be drained completely, but on many engines there are pockets which can not be fully drained, and the kerosene remaining in these pockets will thin the new oil. Under such circumstances the rinsing is of doubtful value. After such rinsing is done, the engine should not be run at full speed or under load until the new oil has had ample time to reach all bearings. The dirty oil drained off may be filtered and used for oiling other farm machines, but it should not be used again in the cylinder. If the oil in the crank case quickly becomes thin it is evident that some of the fuel is getting past the piston rings. This seriously affects the lubricating quality of the oil. It should, of course, be replaced with fresh oil, and steps taken to improve the carburetion so as to form a fuel mixture which will burn more completely.

Keep all Nuts Tight

It requires but a minute or two to go over an engine and see that all screws and nuts are tight, at the same time wiping off any oil and dirt which have collected. This should be done at least once every day the engine is used. Such practice will go far towards preventing many operating troubles, since all gas engines vibrate to some extent and this vibration tends to loosen bolts, nuts and other parts. This is always a potential source of breakdowns, if not of serious accidents. Furthermore, loosening of parts often results in a loss of power.

ROAD WORK IN 1919

Expenditures for highway work in the United States this year are likely to amount to a half billion dollars, or even more, according to a statement made today by officials of the bureau of public roads, United States department of agriculture. On reports received from state highway departments the bureau estimates the expenditures for roads and bridges at $385,000,000, or $110,000,000 more than the average expenditures for 1916 and 1917. This estimate does not include, however, the additional federal funds which will be available if the amendment to the postoffice appropriation bill, making $50,000,000 immediately available and $75,000,000 more on July 1, is enacted into law.

Estimated work under control of the state highway departments includes $45,000,000 for the construction of 5,000 miles of road now under contract, $30,000,000 for 4,000 miles of construction ready for contract, $100,000,000 for 16,000 miles of contemplated construction, and $60,000,000 for maintenance of 200,000 miles. Expenditures of counties, townships, and local road districts are estimated at $100,000,000 for the construction of 15,000 miles and $50,000,000 for maintenance of 100,000 miles.

The highest rental price so far paid for land for cotton was that paid recently for several tracts near Mesa, Arizona, the rental price being $50 per acre per year.

"Old Number One" Still on the Job

IT was F. Gasperich, owner of OilPull No. 314, one of the first 30-60's built—and also still on the job—that first told us about "Old Number One."

"There is a bit of sentiment attached to the OilPull machine, familiarily called 'Old Number One,'" he wrote. "It has been in our vicinity ever since its purchase in 1910 and is still on the job, running better than many new tractors of other makes. It is owned by Frank Schultz, of Agar, S. Dak., and I don't believe there is a man in this state who has done more plowing and threshing with OilPull machines. Recently I had an opportunity of witnessing the performance of this old OilPull and I will say that it is still a marvel of reliability."

So we asked Frank Schultz to tell us of his experience with the pioneer OilPull, and he writes as follows:

"I have done more work with my 30-60 OilPull tractor than any other engine around this part of the country. I don't know just how many hundreds of acres it has plowed or bushels it has threshed, but she's always been on the job and never lacked for power.

"Some of my neighbors have so-called oil burning engines, but when they get down to a hard pull, they're a lot better on gasoline. Many a time I've had 'Old Number One' running on heavy load all day without a stop and she never overheats. This I don't believe any other tractor owner in this part of the country can say. As far as burning kerosene is concerned, it is the only real kerosene burner that I know of.

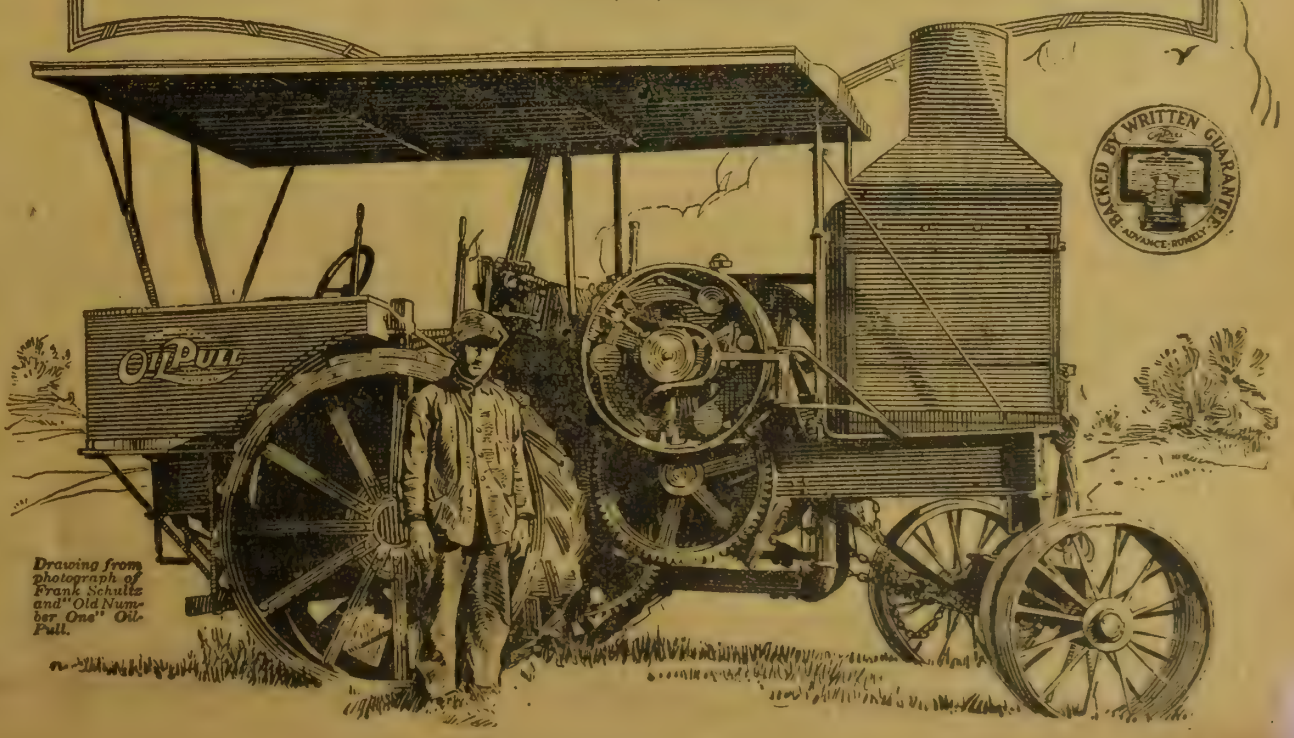
"And the OilPull has a lot of reserve power, which a fellow needs going up steep hills breaking sod in South Dakota. It's the only engine I know that is under-rated.

"The OilPull has more bearing surface and larger shafts than any tractor I've ever seen. I also like the heavy foundation to hold the motor and gearing in place. The carbureter is as simple a mixing device as can be made.

"When you see the OilPull work in the belt you realize the power it develops—how steady the power is and how easily it handles the largest separator.

"In my day I've operated a good many different makes of tractors, but I have yet to see one that will last and stand up like the Rumely OilPull. All the repairs that have been bought for 'Old Number One' would not amount to $200."

What a tractor can do is best told by what it has done. What "Old Number One" OilPull has done during all these years sets a record for tractor performance that anyone can well use as a standard by which to judge any tractor made.



Moreover, into every OilPull is built the same long life, dependability and economy that "Old Number One" has proved out—it's just an example of what OilPull tractors are doing today for over 8,000 owners.

You can get a Rumely OilPull in a size to fit your farm—anywhere from 3 to 10 plows. And Rumely service is within reach of your telephone—no matter where you are—through 26 branch houses, at which are maintained constantly a full stock of machines and repair parts.

Let us send you the OilPull catalog.

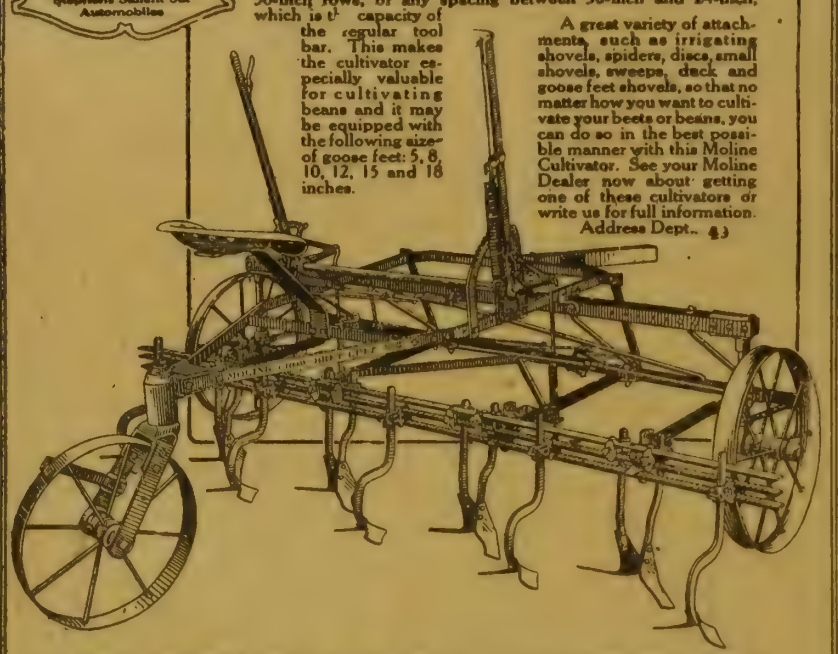
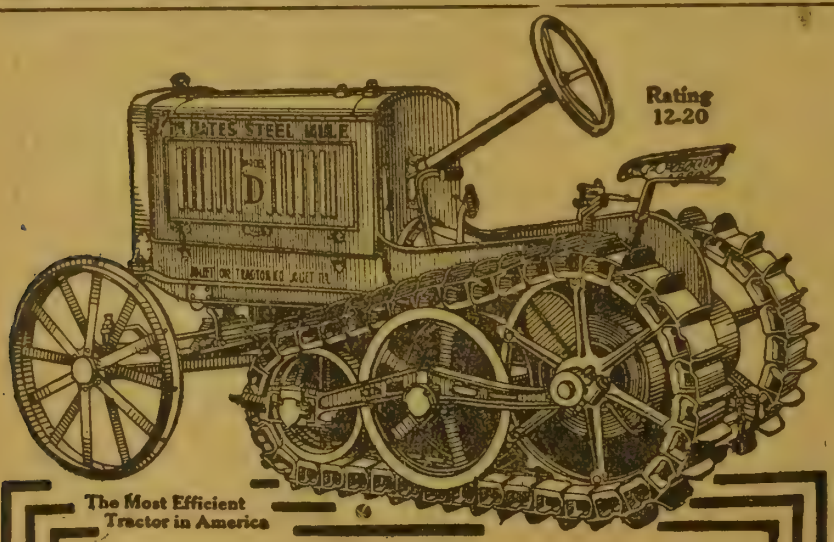
MOLINE
BEET CULTIVATOR

You can cultivate 2, 3 or 4 rows of beets or beans with this cultivator and do a better job, easier, and at less expense than you ever did before.



The operator controls the cultivator with his feet by pushing forward upon the foot levers which pivot the wheels and guide the tool bars in the same direction, thus providing the most efficient method for controlling a cultivator which is used to cultivate more than one or two rows at a time.

The tool bar is of sufficient length so that by the proper selection and adjustment of tools, rows may be cultivated anywhere from 16 to 48 inches apart. The tool bars are attached to the frame in a pivotal position. These connecting pivotal bars are in the line of draft and distribute the pull directly to the tool bars, thus getting the draft point as low as possible and making it as direct as possible.



For cultivating beans an extra long tool bar can be provided which is sufficiently long to enable the operator to cultivate four 30-inch rows, or any spacing between 30-inch and 24-inch; which is the capacity of the regular tool bar. This makes the cultivator especially valuable for cultivating beans and it may be equipped with the following sizes of goose feet: 5, 8, 10, 12, 15 and 18 inches.

A great variety of attachments, such as irrigating shovels, spiders, discs, small shovels, sweeps, duck and goose feet shovels, so that no matter how you want to cultivate your beets or beans, you can do so in the best possible manner with this Moline Cultivator. See your Moline Dealer now about getting one of these cultivators or write us for full information. Address Dept. 43

The Most Efficient Tractor in America

PROVED CRAWLER DURABILITY

Correct mechanical principles and the knowledge of the proper materials and methods of using them make the crawler shoes of the Bates Steel Mule of great durability. Such is the result of six years of experience with thousands of tractors in the field.

Just as important are the heavy duty valve-in-head kerosene motor, the hardened cut steel transmission gears, the Timken roller bearings and the dustproof working parts.

You will be interested in seeing why the Model "D" STEEL MULE is the most efficient tractor on the market today.

Dehydrated Vegetable Industry

THE German submarine may be said to have revived the dehydrated vegetable industry in America, and to have started it upon a career of wide usefulness and importance.

When millions of men were to be fed by transporting practically everything they ate across the Atlantic Ocean, and when ships were anything but plentiful because of submarine depredations, the United States and the Allies realized that anything that would reduce bulk was worthy of consideration. And dehydration does reduce both the bulk and weight of vegetables by from four-fifths to nine-tenths.

But the drying of vegetables had never been generally practiced on a very large scale and, for a long while, even small scale drying had been practically abandoned. Proper methods in preparing the vegetables were not known, and the drying process itself was something of a mystery. Suitable manufacturing plants and equipment were hardly to be found at all. The soldiers had never eaten dried vegetables and army cooks knew next to nothing about how to prepare them.

There were difficulties, but they were overcome. Research by experts of the United States department of agriculture and the sanitary corps of the army resulted in standardizing methods of preparation, drying and packing. It was ascertained that many vegetables could be dried in such a way that they would retain their characteristic flavor and quality and that the process rendered them nonperishable. Millions of pounds of dehydrated vegetables were sent to the armies overseas.

Saves the Surplus

While dehydration was being studied as a means of saving ship tonnage, it gained recognition as a means of conserving the surplus of perishable vegetable crops, permitting increased production and at the same time stabilizing the market, extending the use of vegetables throughout the year, making shipment possible to any part of the country or to foreign countries at no increase in cost to the consumer.

The dehydration of vegetables is a promising industry, but the United States department of agriculture warns that it is not to be undertaken without careful consideration of every factor that may contribute to success or failure. Some of the essentials are, sound fresh materials rigidly inspected and graded, scrupulous care in every detail of paring, trimming, steaming and other preparatory processes, and intelligent oversight of the drying process itself.

Those details attended to, it is possible to use successfully any one of the several types of drying apparatus, though it must be one in which it is easy to obtain steady, uniform air currents over every part of the drying material, while complete control of the temperatures is retained. The dryer must be of the unit type, each unit capable of operation independently of the others. This is necessary in order that the plant may be operated at part capacity, as will often be necessary, without the expense of keeping the entire plant going. The drier must be comparatively inexpensive, as dehydrated vegetables must win their way into popular favor not only by excellent quality but by low cost.

Tunnel Dryer Believed Best

In any given district, a dehydration plant will serve as a safety valve for the fresh vegetable market. Its output will increase or decrease with the rise or fall of prices of fresh materials. Occasionally, because of crop shortage or high prices, it may be necessary to suspend entirely for a season. Such possibilities render large investment in plant ill advised. The department of agriculture believes that the exacting conditions are more nearly met by the tunnel type of dryer than by any other thus far investigated.

Any district which is engaged in general vegetable growing and which regularly produces more of each of its leading crops than the accessible markets can absorb at good prices should look into the possibilities of drying its surplus as a means of extending the market and stabilizing the industry.

Thus far, it cannot be said that any stable market for dehydrated vegetables has been established in this country. Wholesale and retail dealers are waiting to learn more about them, but a few large firms are handling them. A good deal of "selling work" is still necessary, and any group of growers should investigate the possibilities for an assured market before establishing a plant.

The Tomato

By Nellie M. White.

Do not plant in the same ground that you used the previous year. Spade the soil 10 or 12 inches deep and pulverize thoroughly. Tomatoes do well in either sandy or adobe loam.

The Beefsteak is one of the best tomatoes grown for the home table, but do not use it for canning. For this the Stone is better. For very early tomatoes get a plant or two of the Early Stone. If you have room for three or four plants each of the Beefsteak and the Stone, and two of the Early Stone, you will have a great abundance.

Some people claim that three tomato plants will supply an ordinary-sized family, but this is true of only one variety, the Home (or Potato-leaf) tomato.

This plant, if grown on a trellis, and all the side branches pruned off for the first three or four feet from the ground, will produce a wonderful amount of fruit. The plant has been known to grow 18 feet in length.

Select plants that are stocky and sturdy rather than long and spindly. Plant them one or two inches deeper than they were before. It is not advisable to have tomato plants too large, but if they are, plant them nearly up to the neck. Rootlets will form on all sides of the stem under ground. Plant near a fence, building or trellis, or drive a stout stake near each plant to which it can be tied. On adobe soil it is a good plan to mulch the ground around each plant with straw. Plants should be three or four feet apart each way.

Each plant should receive a pint of water when set out, and this should be repeated every other day for a week. Never, in any plant, have the water come in direct contact with the plant. The tomato plant should be shaded for the first week. After the plant is established it should not be watered often. Frequent irrigations and cold soil make blossoms fall off. Three or four irrigations during the entire season are enough.

But in that case you must give frequent shallow cultivation. The tomato roots spread more quickly and over a larger surface than the tops. Consequently, the cultivation must not be deep.

New Grasses For Foliage and Silage

There is never ending inquiry for permanent and perennial pasture grass to suit all soil and climate conditions of the southwest. It is a big problem to find such a grass that will endure both the frosty winters, the hot and dry summers, adobe or sandy soil, the damp meadow or dry mesa, but as difficult as it would seem we are gradually getting closer to the ideal.

Continued experimenting with new importations have brought into prominence several grasses of such merit that to refuse to try them would mean a financial loss to you.

The Napier or Elephant Grass has been so much talked about lately that little need be said here. Now that the seed may be had, although in limited quantities, a packet containing about 3000 seeds may be purchased for 25c, and it requires less than 5000 plants to secure the best results from an acre; within four months there will be enough canes to plant many acres. The crowns survive the summer drought and make an amazing growth with little rain.

It grows readily from joints, which after the canes are hard may be cut midway between the joints, and the joints planted as potatoes. Napier joints may be purchased at $1.00 per dozen, or $5.00 per 100, postpaid.

The wonder forage plant was first introduced by the Aggeler & Musser Seed Company through their 1919 catalog.

It has the sorghum sweetness of sugar cane, and the stooling and heading attributes of the Sudan, one stool having 57 canes with 161 heads and 12 feet tall would indicate full 75 tons of forage per acre, and may be cut several times during the season, and if cut not too late will survive the winter frosts.

Five pounds of seed is sufficient to plant one acre. Culture is the same as for any other sorghum. Price of the seed is 75c per lb., or 5 lbs. $3.00, postpaid.

Smilo Grass is probably the nearest ideal grass for the range of the southwest. It grows anywhere, anytime. Try it. Send 50c for one ounce, or $3.00 for one pound, which is enough for one acre. For other grasses see our catalog.

We are always in the Market for Lemon Culls

After my tomato plants have reached a little size I prune them severely. I cut off the lower side-shoots and many of the upper leaf stems which do not contain blossoms. I get larger, earlier tomatoes, free from rot, by so doing. Do not allow more than three fruits in a cluster; two are better than three.

If you find that something is eating your tomatoes hunt for the worm. Tomato worms are not hard to find. I think this is better than spraying with arsenic poison.

Spraying with Bordeaux mixture in the fall will prevent blight. Pouring a cup of Bordeaux around the stem at the surface of the ground will prevent root blight.

Garden Snails

Answering the question of a gardener in the National Stockman Farmer as to how to control garden slugs, C. H. Hadley of the Pennsylvania experiment station gives advice which may help some perplexed California gardener in meeting the slug attack on his vegetables—now imminent.

The garden snail, or as it should more properly be termed, the "garden slug," is a most annoying and destructive pest of gardens and vegetable crops in general, especially during a protracted wet spell. Slugs are cosmopolitan pests, being found all over the world, and are easily transported from place to place. In the species most commonly found the adult slug is nearly two inches in length, deeply mottled or greenish grey in color, and its body is covered with a mucus-like slime which exudes from numerous pores scattered over the body. The creature leaves a slimy trail wherever it goes, and the presence of this slimy track indicates where it has been. Comparatively little is known of the intimate life and habits of these creatures. The eggs are usually found in isolated masses, with the individual eggs held together in a mass by a transparent, slimy, gelatinous dressing, each egg being about the size of an ordinary buckshot. The young slugs when first hatched are about one-twelfth of an inch long and reach maturity in from four or five months to a year.

Almost all kinds of vegetables are attacked by slugs, as well as field crops and small fruits, especially during a wet season. The pests feed on their host, usually located just at the surface of the soil; often, however, they are to be found feeding actively on the leaves or curled up in repose. It occasionally happens that decay commences in a plant at the point where it has been injured by the feeding punctures of the slugs. They are quite active at night, the tell-tale trail of slimy mucus indicating their wanderings.

When abundant in the field or garden it is a very difficult matter to control them. The most practical method of attack consists in thoroughly cleaning up their hiding places around the edges of the garden, under old boards and stones, and in any place which gives cool and moist shelter. Consistently following up this practice will in time drive the pests away.

Various methods have been advised from time to time for killing slugs. It cannot be said that any one practice will always be effective, but the following methods have given the best results, according to most authorities. The use of poison bait, as advised for cut worms and army worms, is highly recommended. This is made by mixing dry 20 pounds of bran and one pound of Paris green. Then squeeze the juice of three oranges or lemons in about three and one-half gallons of water; chop the skins and pulp up fine (an ordinary kitchen food chopper is admirable for this purpose) and add to the liquid, together with two quarts of cheap molasses. Wet the bran and Paris green with the liquid thus prepared, using just enough to thoroughly moisten the bran without making it sloppy. The bait should be scattered evenly broadcast over the infested ground at nightfall. Another method is to place a small quantity of the bait near each plant in the garden. When broadcasted the quantity made as above will treat about three acres.

Scattering slices of potato, poisoned with Paris green or arsenate of lead, around the infested area is another method said to be effective. Dusting the plants and surrounding ground with air slaked lime or land plaster will have a tendency to keep the slugs away. As mentioned above, the body of a slug is covered with a slimy mucus; when the slug touches the lime or land plaster it will wriggle into it, becoming covered with the powder. This causes an excessive exudation of the mucus and the creature soon exhausts itself and dies. Spraying the plants with arsenate of lead alone or in combination with Bordeaux mixture may be beneficial. In Europe dusting the slugs with fresh slaked lime is advised; it is suggested that the infested plants be dusted early in the morning or in the evening a little after dusk.

In Italy, it is advised to use a cord or tape, one and one-half inches wide, steeped for 24 hours in a 10 per cent solution of blue vitriol. This cord should be stretched on the ground around the plant or area to be protected, and it forms a barrier over which the slugs will not cross, so strong is their dislike for this material.

GARDEN NOTES
By Ernest Braunton

Lilies-of-the-Valley

The lily-of-the-valley is a hardy plant and so cosmopolitan that it grows wild in the mountains of the southeastern United States, Europe and Asia. Yet few grow it out-of-doors. It is a shade-loving plant and needs a rich cool, moist soil, and if such conditions are provided the root-stalks will spread over a considerable area. The roots are medicinal and in large quantities are poisonous, the extract being used medicinally as a heart stimulant. California air is too dry for this lovely plant but they may be successfully grown in cool places where the soil is retentive of water so that the atmosphere may not become too dry. I have seen splendid plants grown here under shade of large trees.

Chinese Tree Propagation

In "Comstock's Botany" (1832) I find a note credited to "Drummond's Botany," a still older work, in which it states that in China branches of considerable size are rooted while on the parent tree. A circle of the bark two inches long is removed in spring and a ball of damp earth placed about the ringed portion and kept in place by a piece of matting tied securely around it. Over this ball is suspended a vessel of water from which a leak drops onto the ball of earth, keeping it wet throughout the summer. In autumn many roots will be found penerating the ball of earth. The branch is sawed off just below the treated portion and planted in the ground. It is said if a fruiting branch is taken a crop will grow on it the next year, an odd thing as a dwarf fruiting tree.

The custom of decorating churches with evergreens is of very ancient date, and most appropriate are those plants mentioned for such use in the Bible. Why, then, do we not use them? "The glory of Lebanon shall come unto thee, the fir tree and the pine tree, and box together, to beautify the place of my sanctuary." And again, according to the prophet Isaiah: "I will plant in a wilderness the cedar, and the myrtle, and the olive tree; I will set in the desert the fir tree and pine tree, and the box tree together." The plants named should be used for church decoration, unless it be on Palm Sunday. The latter is said to be the anniversary of the day Christ went into Jerusalem and the children strewed palm branches before. The Roman Catholics strictly observe this custom of carrying palm leaves in many countries. All materials here noted are easily obtainable in California.

REGISTERED HOLSTEINS

owned by

Walter F. Mitchell, Visalia, Cal.

Thursday, April 3, 1919

You will like the clean, young cattle in this sale, and the good records they have made under ordinary dairy conditions. There are some good candidates for big records in this herd, but they are bound to sell according to their present records.

19 GRANDDAUGHTERS OF SEGIS PONTIAC DE KOL BURKE

are in the sale, and remember that his daughters are making some wonderful records, one of them holding the California senior 2 year old record with a production of 932.25 pounds butter in one year, another holding the California junior 2 year old record with a production of 851.01 pounds butter in one year.

3 DAUGHTERS OF ARCADY PONTIAC WAYNE HENGERVELD

who has the largest list of A. R. O. daughters of any bull yet developed on the Pacific Coast, and a number of his daughters have sold at public sale from $650 to $1075 each.

A BEAUTIFUL DAUGHTER OF SPRING FARM KING PONTIAC 6TH

The daughters of this bull have been making splendid records during the past year, several of them going above 30 pounds butter in 7 days, and this one has the size and capacity that go with great production.

39 COWS AND HEIFERS BRED TO PRINCE HISKE WALKER

This great young sire already has around 40 living daughters, and within a year will no doubt have at least sixty. His heifers are most promising and a good cow or heifer bred to him is worth a place in any man's herd.

PRINCE HISKE WALKER WILL BE SOLD

As Mr. Mitchell is retaining only the young heifers in his herd for future breeding females, and as they are practically all daughters of Prince Hiske Walker, he will part with this splendid young sire in this sale. Consider that PRINCE HISKE WALKER is only just past 4 years of age, now has around 40 living daughters, and probably by sale day over 40 cows and heifers will be in calf to him; that the most of his daughters are in two herds where they will be developed and tested; that he is a son of Prince Gelsche Walker; that he is a full brother to the 34 pound junior 4 year old, Lady Hiske Walker; that he is a very good individual; that he figures as a herd sire of certain transmitting power. This bull will make a fortune for some breeder who has a herd of good females to mate with him.

YOUNG BULLS FOR THE DAIRYMAN AND BREEDER

There are some choice young bulls of good type and breeding in this sale, the kind that are bred in big producing lines.

Catalog free on request.

Dispersal Sale

45 Registered Holstein Cows, Heifers and Bulls
45 High Grade Holstein Cows and Heifers

Wednesday, April 2, 1919
E. R. Putz Ranch, Near Laton, California

Mr. Putz is retiring from the breeding and dairy business and has instructed us to conduct a complete dispersal sale of his well known herd of profitable producers.

While no official testing has been done in the herd, the blood lines are substantial, representing some of the most popular lines of the breed, and the cattle are practically all young, clean, and good producers. This herd contains

24 Greatgranddaughters of Pontiac Korndyke
3 Daughters of Arcady Pontiac Wayne Hengerveld
3 Daughters of Prince Beauty Pieterje Segis

Besides the desirable young cows and bred heifers in the herd, there is a very desirable lot of unbred heifers and heifer calves that will grow into money fast for someone. Dairymen will also find some choice young bulls in this sale, although there are only a few bulls from this herd have been in strong demand and few have stayed in the herd long enough to reach service age.

The Grade Cows and Heifers

are a well marked lot, young, clean, good producers, and all that are bred are in calf to a grandson of Pontiac Korndyke, the present herd sire. Here is an opportunity to buy some grade Holsteins of high quality.

Prince Lunde Korndyke 2nd

the herd sire will be sold. He is a grandson of Pontiac Korndyke and is a fine individual. See this bull and then look over his calves in the herd and you will find that he is getting some exceptionally promising heifers.

Every animal in the sale over six months of age, both purebreds and grades, is tuberculin tested and sold subject to retest by the buyer.

THE FARM is nine miles north of Hanford on paved County Highway; three and one-half miles east of Laton; ten miles west of Kingsburg.

Canadian Says California is Beef Makers' Paradise

Written for California Cultivator By R. P. Royce

WHEN a man who has played the cattle game in Scotland, Canada and the United States, states that he considers that California offers the best opportunities for producing high class beef of any section he has ever visited, his opinion should carry considerable weight and his observations should be of interest.

Thirty years ago John Lillie came to the United States from the south of Scotland. In the old country he had been associated with some of the leading breeders and farmers. He had worked for Thomas Elliott, a famous flockmaster, and for Dr. Gillespie in Dumfrieshire, at one time editor of the Galloway herd book and secretary of that association, and who was considered one of the finest farmers and breeders of Scotland.

Lillie went to Colorado and for 23 years was connected with the cattle industry of that state. For some years he operated his own outfit; later he had charge of several large firms. It was John Lillie who fed and exhibited the grand champion steer at the first Denver live stock show.

Seven years ago he was called to Canada and became identified with the development and experiment work in beef cattle management carried on by the Canadian Pacific Railroad.

He is now in California investigating the possibilities of this state with the idea of locating somewhere in the Sacramento Valley. Recently, in conversation with the writer, Lillie said: "I have been connected with the cattle business all my life—in Scotland, Western United States and more recently in Canada, and I have never seen any section that I consider has greater advantages for cattle raising than I have found in California.

"Conditions here are almost ideal and more closely remind me of some of the great producing centers of the old country than any place I recall. At the same time I do not know many sections that have apparently made less progress.

"There is every reason why California should be the greatest producing and finishing section. Because of the climatic conditions cattle can grow every month in the year, and feed grains and grasses can be produced in great abundance. The limiting factor to what can be accomplished apparently is the water supply. But some day most of your great interior valleys will be provided with water. Speaking of irrigation, I am convinced that a more permanent and profitable agriculture can be developed under a system where the supply comes from streams and rivers than from wells. Well water never carries the amount of valuable plant food that one finds in river water, and while that fact might seem small and unimportant, in the end it has a high value.

"So, with irrigation there is no limit to the amount of feed that can be produced and it takes feed to produce cattle profitably. I have fed cattle all my life and mostly my feeding was carried on in cold sections, and I know that if one can feed profitably in those sections, where expensive shelter must be provided, and where a lot of feed is required for bare maintenance, that more money can be made out here where the winters are not severe, where cattle need no expensive shelter and where the cost of maintenance is reduced to a minimum. That fact is as clear as crystal.

"I have heard it said that the California markets have not encouraged cattle feeding, that no premium is paid for grain finished beef over grass stuff; but I want to say that that condition is bound to change. If it does not, I believe that beef can be finished in this state at a cost per pound that will enable the producer to ship to Missouri River markets and compete with Eastern finished stuff.

"Out here, barley, oats and corn can be produced, along with alfalfa, silage and roots. California also produces cotton seed by-products. With such a combination the best of beef can be produced, but there is one weak point in the system, it seems to me, and that is the need for better pastures. I was astonished to find how few cattlemen have attempted to develop pastures. I am a firm believer in making beef on grass and if I were operating out here I would certainly aim to have green grass every month in the year. I see no reason why the average California ranch, with water, could not have the finest sort of pastures. Irrigated pastures are profitable in other sections. We used them in Colorado and in Canada.

"When I first went to Canada few cattle were being fed. My work was along demonstration lines, and to prove what could be done I fed out a lot of long yearling grade Shorthorn steers. These steers were taken from the cows at about six months of age. They were wintered well the first winter—just kept growing, and the next spring they were put on good native pastures and given a little barley and oats. They were fed on grass until September, when they were put in the finishing lot and started on full feed. They were marketed the following May at Chicago, weighing 1400 pounds, and sold for the top price. At the time, they held the Chicago record for price and weight for age. They made money and I am positive that better results can be obtained out here.

"Another fact that has impressed me in regard to the opportunity this state holds for the cattleman is the opportunity for the development of pure bred herds.

"Because of the very reasons that make the commercial cattle business so attractive the pure bred business is full of possibility.

"I believe that one of the reasons that England and Scotland have held their supremacy in the live stock world is largely due to the fact that, for the most part, climatic conditions are such that stock can grow practically every month in the year, and can be maintained on an out of doors plan. In this state conditions are such that I believe more size can be developed, as much bone can be produced, and I believe that as much constitution and vigor can be bred into cattle as in any other section of the world.

"If I am correct in my assumption, is it not fair to expect that some day California will be recognized as a great live stock nursery to which will come much of the best live stock trade?

"And in this connection I want to

The Guaranty Sale

"The Holstein Classic"

Thursday March 27, 1919

State Fair Grounds, Sacramento, Cal.

65 Head of the Very Best

Eight Cows With Records From 30 to Over 37 Pounds Butter in 7 Days

From the Committee who selected these great individuals from fourteen high class Pacific Coast herds, and who know the wonderful combination of individuality and breeding they represent, to the man who compiled the pedigrees of the wondrously bred cattle in this sale, there comes the same comment: "THE HIGHEST CLASS LOT OF HOLSTEINS YOU HAVE YET SOLD IN A PACIFIC COAST SALE."

You too can scarcely fail to be impressed with the tremendous effort, many times made at real sacrifices on their part, the western Holstein breeders have put forth in this sale to give other breeder and beginning breeders an opportunity to buy in a sale composed only of the highest class cattle. Possibly no single feature better represents the extraordinary average breeding in this sale than the figures on offspring of better than 30 pound cows and better than 30 pound sires:

Thirty sons and daughters of cows with official records from 30 to over 41 pounds butter in 7 days.

Forty daughters and sons of sires whose dams have official records from 30 to 40 pounds butter in 7 days.

Then in the matter of high record individuals, all high standards established in previous Pacific Coast sales have been completely surpassed, including

THE HIGHEST RECORD BULL EVER SOLD IN A PACIFIC COAST SALE, his dam having 41.01 pounds butter from 831.7 pounds milk in seven days, 158.31 pounds butter from 3584.2 pounds milk in 30 days, highest combined milk and butter record ever made by a cow in the United States in 30 days.

THE HIGHEST RECORD COW EVER SOLD IN A PACIFIC COAST SALE, the famous cow BOWEDA, 37.61 pounds butter in seven days. She is a great individual, with the size and strength that make her a promising candidate for even a higher record.

Previous announcements have gone into some detail in regard to the various consignments to this sale, and also regarding the various individuals in these consignments. Now consider the fact that out of the 59 cows and heifers in this sale there are about a dozen of the highest class heifers not yet of breeding age, and there will be possibly three or four fresh cows not bred, but all of the balance of the females are bred to the outstanding bulls of the Pacific Coast; among which you will find—

THE WORLD FAMOUS $106,000 BULL, CARNATION KING SYLVIA, owned by Carnation Stock Farms, Seattle.

MATADOR SEGIS WALKER, sire of the latest 40 pound senior three year old, and who now has a 29.64 pound three year old daughter besides a splendid list of high record two year olds. Also owned by Carnation Stock Farms.

JUDGE SEGIS, the mighty proven son of King Segis, owned by Hollywood Farm, Hollywood, Wash. His first daughter tested at mature age made over 37 pounds butter in seven days, he has a fine list of high record two year olds, and he is being given an opportunity second to none at Hollywood.

CHIMACUM SPRING FARM KING PONTIAC, owned by Albert E. Smith, Sumas, Wash. None of his daughters are yet of milking age, but we saw a whole herd of them and they are GOOD. One of them is in this sale, out of a 30 pound junior four year old daughter of a 30 pound cow.

KING KORNDYKE PONTIAC 20TH, the famous $6500.00 bull owned by W. J. Higdon, Tulare, Cal., who is not outranked in popularity by any of the younger sires in California.

"IT," the noted McAlister bull, whose offspring have commanded uniformly high prices wherever they have been offered. See some of his great sons and daughters in this sale.

SIR AAGGIE MEAD DE KOL, owned by A. W. Morris & Sons, Woodland. He has the highest average in the world for yearly butter records of his seven nearest dams, 1093 pounds.

SIR AAGGIE DE KOL ACME, owned jointly by F. W. Kiesel, Sacramento, and A. W. Morris & Sons, Woodland. His dam is the 85 pound cow Aaggie Acme of Riverside 2nd, whose strictly official record of 1331.78 pounds butter in one year is a world's record.

SIR AAGGIE DE KOL ACME 2ND, owned by Alex Whaley, Tulare. Five of the seven nearest dams of this bull average 1105.07 pounds butter in one year, second highest in the world.

KING SEGIS ALCARTRA PRILLY, owned by Bridgford Company, Knightsen. Twice grand champion at California State Fair and he is a 30 pound son of the $50,000 bull King Segis Pontiac Alcartra.

KING SEGIS ALCARTRA ABBEKERK, owned by Bridgford Company. Also a 30 pound son of the $50,000.00 bull, and he has an exceptionally promising lot of daughters approaching milking age.

KING PONTIAC NETHERLAND SEGIS 3D, owned by A. J. Stalder, Riverside. His dam is the twice 34 pound cow Gerben Abbekerk Maid, and three of his daughters to freshen recently as junior two year olds have made over 20 pounds butter each in seven days.

KING SADIE VALE IDYL SEGIS, owned by R. F. Guerin, Visalia. By one of the best sons of King Korndyke Sadie Vale and out of a 35 pound four year old daughter of King of the Pontiacs.

PRINCE HISKE WALKER, owned by W. F. Mitchell, Visalia. Full brother to the 34 pound junior four year old Lady Hiske Walker, and one of the most promising young sires in the state.

THE $4000 BULL, PRINCE GELSCHE WALKER KORNDYKE, owned by F. W. Kiesel, Sacramento. He has a most promising lot of young daughters coming on at Jane Garden Farm.

THE CALVES FROM THESE BULLS OUT OF THE WONDERFUL FEMALES IN THIS SALE WILL BE WORTH SMALL FORTUNES TO YOU, WHETHER YOU WISH TO RETAIN THEM AS BREEDING ANIMALS OR IF YOU WANT TO SELL THEM.

Every animal in the sale is positively guaranteed to be a breeder; every animal over six months of age tuberculin tested and sold subject to 60 day retest by the buyer.

Wonderful Selection of Herd Sires

There are six young bulls in this sale, every one of them out of a dam with an official record of from 30 to over 41 pounds butter in seven days; every one by a sire whose dam has an official record of from 30 to over 37 pounds butter in seven days. They are high record, richly bred bulls of splendid conformation, and selected for this sale because of real herd heading quality.

GUARANTY SALE

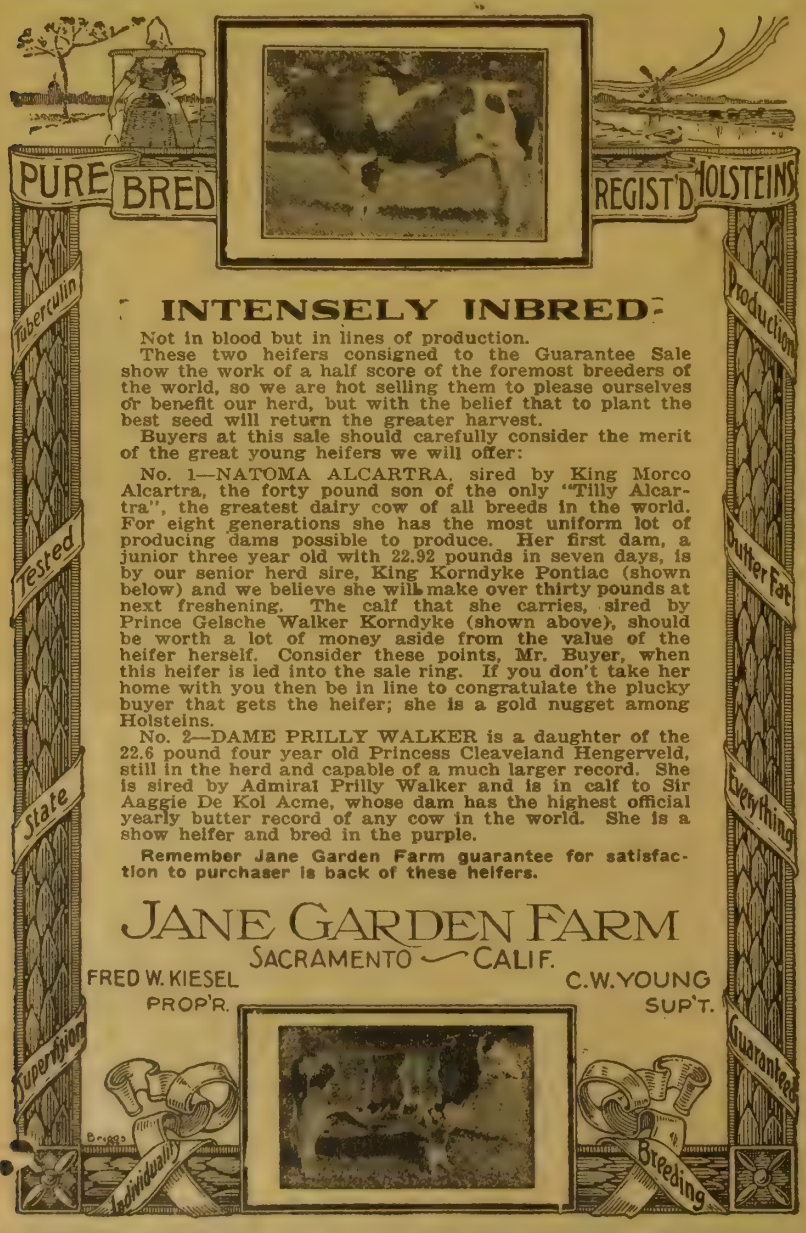
Sacramento, March 27

Will Be—of Course

McAlister & Sons

LOOK AT THESE!

Miss Pontiac Nudine of Springvale, a twice 30 lb. cow right in her prime and one of the nicest individuals you ever looked at.



Georgia Pontiac 2nd, a 23 lb. two year old granddaughter of the famous Rag Apple Korndyke 8th. She milked as high as 95 lbs. in one day and her milk record is third highest in the world for age.

Six beautiful daughters of our famous herd sire, "It," whose two nearest dams average over 36 lbs. butter in seven days and were both world's record cows.

Two of these are out of a 35 and a 34 lb. daughter of King of the Pontiacs—one out of a 29 lb. 3 year old daughter of King Segis Pontiac; one from the famous 30 lb. three year old May Korndyke; one from the 32 lb. three year old, Meta Ward Kuperus, and one from the former state champion three year old Etta Changeling Wildwood.

Two sons of "It"—From a 33 and a 31 lb. dam. Future herd sires for some great herd.

Look for this consignment. It is worthy of your attention.

INTENSELY INBRED

Not in blood but in lines of production.

These two heifers consigned to the Guarantee Sale show the work of a half score of the foremost breeders of the world, so we are hot selling them to please ourselves or benefit our herd, but with the belief that to plant the best seed will return the greater harvest.

Buyers at this sale should carefully consider the merit of the great young heifers we will offer:

No. 1—NATOMA ALCARTRA, sired by King Morco Alcartra, the forty pound son of the only "Tilly Alcartra", the greatest dairy cow of all breeds in the world. For eight generations she has the most uniform lot of producing dams possible to produce. Her first dam, a junior three year old with 22.92 pounds in seven days, is by our senior herd sire, King Korndyke Pontiac (shown below) and we believe she will make over thirty pounds at next freshening. The calf that she carries, sired by Prince Gelsche Walker Korndyke (shown above), should be worth a lot of money aside from the value of the heifer herself. Consider these points, Mr. Buyer, when this heifer is led into the sale ring. If you don't take her home with you then be in line to congratulate the plucky buyer that gets the heifer; she is a gold nugget among Holsteins.

No. 2—DAME PRILLY WALKER is a daughter of the 22.6 pound four year old Princess Cleaveland Hengerveld, still in the herd and capable of a much larger record. She is sired by Admiral Prilly Walker and is in calf to Sir Aaggie De Kol Acme, whose dam has the highest official yearly butter record of any cow in the world. She is a show heifer and bred in the purple.

Remember Jane Garden Farm guarantee for satisfaction to purchaser is back of these heifers.

JANE GARDEN FARM

SACRAMENTO — CALIF.

FRED W. KIESEL, PROP'R. C. W. YOUNG, SUP'T.

say that my work has kept me in rather close touch with the leading agricultural institutions of this country and Canada and I will say with all frankness, that at no institution have I found a better class of live stock than I saw on a recent visit to the University Farm at Davis, and I have been wondering if the people of this state really appreciate the value of that institution's accomplishments at the International Show at Chicago. I have heard cattlemen up in Calgary discuss that wonderful calf that was shown at the 1916 show.

"I may seem a bit over-enthusiastic as to the future of the cattle business in this state but for 30 years I have been a close student of the factors necessary for success in this business and when I find them—all in one place—I can't help but feel enthusiastic."

Thus is added more expert testimany from a practical cattleman as to the possibilities of this state becoming one of the great live stock producing centers of the United States.

OFFICIAL TESTING AT TOYON FARM

Toyon Farm Association reports the completion of several good records, including a number of immature animals which are very creditable. Three three-year-olds, Valdessa Clarkhurst Pietertje 2d, Stanislaus Princess Pontiac and May Lilu Hiljaard Segis 3d, have all made records of about 25

Charles MacDonald
Under whose care Ormsby Segis Marie made her world's record. In charge of Toyon Farm Holsteins, Los Altos, California.

pounds on seven-day test. Finderne Jondine Pontiac as a two-year-old has made 22.16 pounds. This record is particularly gratifying to her owners, as Toyon Farm Association has a number of animals of similar breeding, including their herd sire, all being from daughters of King Hengerveld Aaggie Fayne.

Ormsby Segis Marie, illustrated on the cover, has settled down for another year of wonderful production. Though kept on very light grain ration because of the caution of Charles MacDonald, the efficient herdsman in charge of Toyon Farm herd, and not crowded for any large seven-day record, she has repeatedly made 30 pounds per week without the least effort, being chiefly on a ration of alfalfa hay and corn fodder. Last month she produced 123 pounds of butter and is at the present time producing as high as 106.6 pounds of milk per day. On account of her great value as a breeding animal MacDonald is taking no chances. It will be remembered by those who follow Holstein history that this heifer last year in the senior three-year-old class broke the world's record for yearly production with 27,025.7 pounds of milk and 1074.54 pounds of butter, giving on the 365th day of her year's work the remarkable production of 60.2 pounds of milk. Since that time she has been shipped from Washington while in calf, and it will probably be another season before she will be at her best.

SANTA ANITA RANCHO

Anoakia Breeding Farm

Arabian-Thoroughbreds

Out of our choicest thoroughbred mares and sired by our famous imported stallion Ibn Mahruss we are offering some splendid two year olds. Also some especially desirable young saddle stock sired by Ibn Mahruss, world renowned Arabian desert stallion, and Don Castano, five gaited saddle stallion, winner in many prominent shows.

Messrs. Intelligent Farmer, Wife & Company,
In the forward-looking
State of California.

Friends:—

Dairying is the second largest farming industry. From it comes foods for all the people, all the time. There's a great demand for dairy supplies. But dairying is like any other business, it must be conducted efficiently to make it pay. Feeding must be done wisely and continuously.

The silo offers solution of the green feed question. The Simplex Silo is scientifically constructed; storm proof, wind proof. The interlocking anchor system cannot fail. It eliminates all possibility of vibrating, twisting or collapsing. The Simplex Silo insures your ensilage to the last ounce.

The Simplex Silo is the result of many years of experience and looking into the needs of Pacific Coast ranchers. Dry weather, nor an empty silo, does not affect the Simplex. Each stave is stapled securely to the top, center and lower hoop.

Simplex Silos are constructed of Oregon Pine (Douglas Fir). The hoops are of New Steel. Castings, cable braces, door hinges and hoops are heavy, thus insuring strength and durability.

Efficiency in feeding silage necessitates your own cutter. The forage should be put away at just the right time. With your own outfit the saving is sure and certain.

The Papec Pneumatic Ensilage Cutter is the standard all over America. Its record for fewer break-downs is its best claim to your attention. It is easy to save ten dollars an hour with a Papec. Reliability and the silo filled when you want it, make Papec customers.

The Papec is the easiest cutter to set up and take down, only the pipe has to be erected and removed. There are no bolts or rivets in the frame to get loose and allow the cutting wheel to get out of line.

The Papec has the greatest capacity, the lowest speed, the smallest power consumption and the lowest cost of upkeep of any ensilage cutter manufactured.

A complete stock of Papec Pneumatic Ensilage Cutters and Simplex Silos is carried in stock here ready for immediate shipment.

You are invited to telephone, telegraph, write, or, best of all, call to see us. Let us prove to your satisfaction that you need a Silo, and that the Simplex and the Papec are the outfit best suited to your requirements.

If there are two words which describe them for you, they are: permanence and profit.

Respectfully,

Santa Fe Lumber Co.

Neufchatel Cheese

By H. S. Baird in Bulletin of California Agricultural Experiment Station

NEUFCHATEL cheese is one of the common soft cheeses and when properly made is a very palatable food. Its production affords the person who has a small amount of surplus milk an outlet for his product, and its manufacture is practical on a large scale. Neufchatel cheese is not difficult to make when the proper method is carefully followed. It can be made either from goat's milk or cow's milk but goat's milk usually makes a smoother, closer-grained product. The whole milk is generally used and it should be sweet, testing not over 0.18 per cent acid.

The milk may be either raw or pasteurized; pasteurization is advisable, since it will insure a better-keeping and more uniform cheese, as well as destroy disease-producing bacteria which may be present in the milk. If the milk is pasteurized it should be heated to a temperature of 140 degrees to 145 degrees Fahrenheit and held at that temperature for 25 minutes, after which it should be cooled quickly to 72 degrees Fahrenheit.

The milk is usually placed in five-gallon shotgun cans. Even where Neufchatel cheese is made on a large scale the milk is placed in five or ten-gallon cans in order to insure a uniform temperature. After the milk has been pasteurized and cooled to 72 degrees Fahrenheit the water bath should be tempered to the same degree.

Setting

In making Neufchatel cheese "setting" refers to the addition of starter and rennet. Starter (good clabbered milk) should be added at the rate of 25 to 50 cubic centimeters* (about one to two ounces) per 100 pounds of milk. When making large quantities of milk into cheese a commercial lactic starter should be used. A commercial starter is one prepared in a special laboratory and contains a pure culture of the desired bacteria. These starters may be secured from the laboratory or through the dairy supply houses. Directions for handling starters should be requested when securing the first culture. A 25-cubic centimeter pipette graduated to tenths, to be used for measuring the rennet and starter, will also be furnished by any dairy supply house.

Rennet is added at the rate of 2½ cubic centimeters per 100 pounds of milk. Before adding it to the milk it is diluted with twenty times its volume of cold water. Care must be taken not to add too much rennet, as it will cause a coarse-grained, poor-quality cheese. The rennet and starter should be mixed thoroughly with the milk, the can covered and the milk allowed to stand in the water bath for 15 to 18 hours.

Draining

The curd is ready to drain when a thin layer of whey appears on top and at the sides and the acidity of the free whey tests from 0.3 to 0.5 per cent. The curd, at this time, should be rather firm. A low acidity at the end of 18 hours indicates too low temperature or insufficient starter. If the acidity is too high it is probably caused by the opposite conditions.

When the curd is in proper condition it should be poured into drain sacks, without cutting, using a separate cloth for each can of milk. Cloth used for draining sacks should have a mesh similar to that used for flour sacks. Ordinary cheese cloth is too coarse and will allow too much curd to escape. The sacks of curd should be hung in a cool place to drain, which usually takes about eight to ten hours. While draining, the curd should be rolled in the sacks and thoroughly mixed, occasionally, in order to prevent the cheese next to the cloth from drying. Failure to do this may cause a lumpy cheese. In some cases the curd may be sufficiently dry after draining but ordinarily it requires pressing to remove the excess whey.

Pressing

A pressure from one or two bricks for each sack of curd is sufficient. The sacks of curd may be placed between two boards and the bricks placed on top, or it may be placed in a cheese hop with a follower and bricks placed on top. The time required for pressing will depend upon the condition of the curd, ordinarily it requires about 12 to 14 hours.

Salting

After pressing, the curd is removed from the sacks and salted at the rate of two ounces per ten pounds of curd. After thoroughly mixing the salt with the curd it is run through a food grinder twice. The grinding gives it a fine, smooth grain.

This cheese is usually eaten while fresh, although it may be cured for a month or six weeks. Good Neufchatel cheese should have a mild, clean flavor and a smooth, buttery texture and body. It should contain about 55 to 60 per cent moisture. A cheese which is too dry will usually be grainy and lumpy, while one containing too much moisture will be very soft. When marketing the cheese it is molded and wrapped in special forms or placed in special containers.

Molding

Neufchatel cheese is commonly molded in a cylindrical form, 1¾ inches in diameter and 3¾ inches long and wrapped in tinfoil lined with parchment paper. Very often the cheese is tamped in a small cylinder made of tin and having a diameter of 1¾ inches. After the cylinder is filled the cheese is forced out and cut in desired lengths.

This cheese is also marketed in paraffined paper boxes, although this is not a common package. Any package which is used should be practically air-tight and one which will not absorb water from the cheese. An air-tight package prevents shrinkage and keeps the cheese in good condition for a longer period than one which is not air-tight.

After it is manufactured the cheese should be kept in a refrigerator until sold.

The yield of Neufchatel cheese will depend upon the kind of milk used and upon the butterfat test. From ordinary cows' milk testing 3.6 to 4 per cent fat, the yield will be about 12 to 14 pounds per hundred pounds of milk.

Neufchatel may be used as a vehicle for various flavors such as pimento, nuts, chili, etc. These should be added in sufficient amounts to give the desired flavors.

*One teaspoon level full contains 3½ cubic centimeters.

NEWS NOTES FROM NEVADA

Hon. H. F. Danberg of Minden, in the Carson Valley, has just purchased a carload of excellent Hereford females to place on his fine home ranch.

The present legislature has just passed a bill authorizing a veterinary examination board and providing for the licensing of veterinary practitioners.

The bureau of animal husbandry of the University has just sold a Von Homeyer Rambouillet ram lamb to head Mr. George Wingfield's pure bred flock of Rambouillets.

The first annual meeting of the Southern Nevada Cattle Owners' Association was held at Goldfield Saturday, February 22, with 22 members of the association present. Many subjects of interest to the industry were discussed at the meeting. The officers elected for the ensuing year are: J. B. Humphrey, Goldfield, president; C. W. Love, Alamo; L. P. Kimball, Pioneer; David Patterson, Fish Lake; B. F. Rogers, Round Mountain, and George F. Dugan, Keystone, vice president; Ira Murdock, Goldfield, treasurer; C. Curley, secretary.

Nevada legislature has appropriated money for the state fair to be held at Fallon, thus disposing of the fight made by Reno to have the fair moved back to Reno.

Arizona Dairy Law

Written for California Cultivator By M. E. Bemis

AT A SPECIAL session of the Arizona legislature held last summer a dairy bill creating a state dairy commission became a law, and W. A. Barr, formerly agricultural agent for Maricopa County, was appointed state dairy commissioner. Under the provisions of the law the commissioner was empowered to make and enforce regulations looking to the more sanitary production and handling of all dairy products.

Makes Possible Appetizing Product

Model sanitary milk house recommended by the Arizona state dairy commissioner.

Among the rules for the sanitary handling of dairy products is that milk must be immediately cooled in a room free from dust and a certain distance from the barn or corral. That these rules may not work too much of a hardship on dairymen Mr. Barr has had plans for an inexpensive milk-house made, and has at his office a model of such a house. This house is 10x14 and requires the following bill of lumber:

Sills and plates—4 pieces 2x4-10.
Sills and plates—4 pieces 2x4-14.
Studs—8 pieces 2x4-14.
Rafters—14 pieces 2x4-14.
Siding—360 feet ⅝x6.
Flooring—140 square feet.
Sheeting—30 pieces 1x6-14.
Three windows—30x30 inches.
One screen door.
Screen wire for three windows (12½ sq. ft.).
Nails—6 pounds 6d.
Nails—3 pounds 4d.

Livestock Meetings and Sales

University Farm, April 7 to 12

During the week of April 7-12 the live stock interests of the state will center their activities at the University Farm, Davis. During the week the California Cattlemen's Association will convene, with delegates puresent from 49 counties. The California Shorthorn Breeders Association and the Pacific Coast Hereford Breeders' Association will each hold sales, and on Thursday the California Swine Breeders' Association will meet in annual session.

The cattlemen have recently effected one of the strongest live stock organizations in the country and it is expected that the association will discuss plans that will put the business on a much firmer basis. The marketing question will receive careful attention and it is announced that H. T. Watter, who is familiar with the cooperative live stock marketing system in operation in Hawaii, will detail the plan that has proven successful in the islands. H. A. Jastro, chairman of the marketing committee of the American National Live Stock Association, will be present and outline the work of his committee. O. M. Plummer, manager of the Pacific International Show at Portland, and who has recently announced a plan for organizing all the live stock interests of the Northwest, will appear on the program.

The cattle sales promise to set a high mark in the development of the pure bred industry. Each association is making a special effort to assemble an offering that will represent the best that Western herds afford, and either sale provides an opportunity for the breeder or the range man to select breeding stock that will add strength to his operations. It is not too much to say that there was never so keen interest manifested in beef cattle as exists in California at the present time.

Following the cattlemen's meeting and the sales, the members of the California Swine Breeders' Association will meet.

This association has been the biggest factor in the development of the swine business of this state—first in stimulating the production of more and better hogs and second, through President C. B. Cunningham, a member of the live stock commission of the food administration, in meeting the government's plea for more pork.

At present plans are being considered that, if they mature, will go far toward improving the markets of this state.

California is making progress in the development of her live stock resources, but before making great headway it will be necessary to solve several problems affecting the business, and these important problems can only be solved satisfactorily by all interests working together.

Pork Prices Cut Loose

A press dispatch from Washington, under date of March 5, announces that pork and pork products have been removed from the export conservation list, and that the War Trade Board will no longer require that applications for licenses to export pork products be approved, as to price, by the food administration.

This removes the prop that has been used by the food administration for stabilizing pork prices. Since October, the minimum of $17.50 for average packer's droves, agreed to by the producers and packers, has been made possible through the fact that, because of controlled orders, the administration was able to buy pork for export at a price that justified the $17.50 minimum.

Just how the market will be affected remains to be seen. If the embargo in operation against Germany is raised, thus bringing a fat-hungry nation into competition with an already short rationed world, it is more than likely that higher prices will result. If on the other hand the packers simply take advantage of the situation and proceed to hammer the market without a corresponding decrease in prices to the consumer, the producers will doubtless have something to say.

SURE DOOM SEEN FOR CATTLE TICK

The cattle fever tick will be permanently driven from American soil within the next few years. That is the belief of officials of the bureau of animal industry, United States department of agriculture, who have returned from the conference of tick eradicators at New Orleans.

Dr. J. R. Mohler, chief of the bureau of animal industry, set 1923 as the last year for the tick's residence on American soil. He called on the tick fighters to clean up 90,000 square miles of territory this year, a third of the area still under federal quarantine. He mentioned 1923 because the new state-wide law in Texas does not become effective in the last of the three zones in that state until 1922. But a report from Texas said that with proper state and county cooperation the "Lone Star commonwealth" may be placed in the freed area by the end of 1922.

Pacific Coast Hereford Breeders'
—Second Sale—

University Farm, Davis, Cal.
Wednesday, April 9, 1919

80 Registered Cows, Heifers and Bulls

Many of the most successful and profitable pure bred breeding herds had their beginning in the purchase of a few head of registered animals and the gradual replacement of the common cattle with pure bred increase.

Why not add one or more good registered cows or heifers to YOUR herd now, and secure greater and quicker returns from your investment of labor and money?

You will find the right sort of registered Hereford cows and heifers in this sale for foundation stock, and bulls fit to mate with them.

Rangemen will find in this sale a good selection of young bulls with the size, ruggedness, and breeding that qualify them for range service, the kind whose offspring make greater weights and mature earlier than common cattle with the same feed and care.

A catalog of this sale will be mailed free on request.

Please mention CALIFORNIA CULTIVATOR.

The Great Opportunity For Stock Owners

During the immediate future the stock owners of America will enjoy the greatest money-making opportunity of a generation. *There is an acute world-shortage of animal products.* The investigators of the U. S. Food Administration report that the flocks and herds of Europe are so reduced that they must be kept for breeding purposes in order to make good these losses.

America must supply the hungry nations with animal foods. This insures a ready market and good prices until Europe's animal population is restored.

Pratts Animal Regulator

will help every American stock grower "speed up" every producing animal and secure his full share of this profitable business. It increases growth and production and reduces feeding costs. This fact has been convincingly demonstrated by leading stock growers during the *fifty years* since the original Pratts was placed on the market.

Its regular use overcomes the evil effects of heavy feeding, confinement and lack of exercise, conditions which of necessity accompany modern methods of stock production. It keeps stock of all kinds *healthy* and *vigorous*, and *prevents losses* from the common profit-destroying disorders.

Give Pratts to your horses, cattle, sheep and hogs and watch your profits grow! Give it a careful test at our risk.

Our dealer in your town has instructions to supply you with Pratts Preparations under our square-deal guarantee—*"Your money back if YOU are not satisfied"*—the guarantee that has stood for nearly fifty years.

Milky-Way Farm

Contributes to

THE GUARANTY SALE

Sacramento, March 27, 1919

AVA MODEL HENGERVELD 2ND; 21,222.3 pounds milk and 971.56 pounds butter last year on semi-official test; at last freshening made over 30 pounds butter from 708 pounds milk in 7 days, and now on semi-official test again, promises to go well over 1000 pounds butter for the year. She is bred to Judge Segis. She is by a good son of Colantha Johanna Lad and out of a granddaughter of Hengerveld De Kol.

Her daughter, AVA HARTOG PIETERTJE, is full sister to Korndyke Model Hartog, first prize 3 year old at National Dairy Show last year, and who made 30.84 pounds butter in 7 days as a junior 4 year old.

Her granddaughter, KORNDYKE MODEL HARTOG 3D, is by our great young herd sire Chimacum Spring Farm King Pontiac, and out of Korndyke Model Hartog, the 30 pound show heifer. This heifer is of show quality herself. Both this heifer and the one mentioned above are due to drop their first calves in April to a son of 31 pound 2 year old.

Her half sister, DE KOL BUTTER BOY BELLE 2D, made 28.08 pounds butter from 700.7 pounds milk in 7 days last year, and is due to freshen the day after sale to Chimacum Spring Farm King Pontiac. She is a very large cow, weighing close to a ton, of excellent type, and a fine prospect for a much larger record.

PRINCESS JONGE BUCKEYE, a great yearly producer;

TOBE MANOR DE KOL, a young show cow and a great producer;

JESSIE HENGERVELD JOHANA, a great 27.70 pound cow now milking around 95 pounds per day on semi-official and bred to the $106,000.00 bull Carnation King Sylvia .

We expect to have our cattle on the sale grounds two or three days before sale and you are cordially invited to come and look them over.

Our Herd is Under Federal Test

REGISTERED DUROC-JERSEYS

You can bank on this breed of hogs. The demand is greater than the supply. Every point the buyer demands for a profit-making hog is found in the Duroc. We can supply you with weaning pigs, either sex. Our herd boar has the blood of Ohio Chief, Defender, Crimson Wonder, Jack's Friend, Joe Orion, etc.

THE GARDINER RANCH

ROUTE 4, BOX 735. SACRAMENTO, CALIF.

Live Stock News Notes

Dairy Cattle Congress, Waterloo, September 22-28

The Dairy Cattle Congress will be held at Waterloo, Iowa, September 22-28 instead of the October date announced last fall.

Chester White Sow Sells for $4200

In the recent sale of Chester Whites held by W. F. Barr of Ames, Iowa, the sow Leonora 4th sold to B. M. Boyer & Sons of Farmington, Iowa, for the world's record price of $4200. In the same sale 40 head of bred sows and gilts made an average of $557.

O'Connor to Go East

J. Francis O'Connor, owner of the Castleview herd of Berkshires, Santa Rosa, is planning a trip East and while away will visit a number of the leading Berkshire herds of the Middle West and Eastern states. It is probable that O'Connor will make several additions to his already good herd.

Visiting Eastern Hereford Herds

Chas. Rule of Duncan Mills and W. J. Bemmerly of Woodland, two of the leading Hereford breeders on the Pacific Coast, are now in the East attending many of the important sales. It is probable that both breeders will make selections of breeding stock for the purpose of strengthening their herds.

National Dairy Show October 6-12

The National Dairy Show will be held at Chicago, Illinois, October 6-12. The last time this event was held in Chicago was in 1914—the year of the foot and mouth disease outbreak. In 1916 the show was taken to Springfield, Massachusetts, and in 1917 and 1918 it was held at Columbus, Ohio.

State Jersey Breeders to Meet at Davis

The annual meeting of the state Jersey breeders will be held at the University Farm in the near future—either the latter part of March or early in April.

It is expected that several important matters relating to the progress of the breed in this state will come up for discussion. For that reason, every breeder should make a special effort to attend.

254 Shorthorns Average $785

During the Shorthorn Congress show and sale held at Chicago, February 18-20, 254 head of bulls and females sold at public auction for $199,500, an average of $785.

The top price recorded was $5000, which was paid for the yearling bull Hercules Diamond, shown by Day & Rothrock of Sprague, Washington.

Hercules Diamond is a son of Gainford Perfection.

Carnation King Sylvia

The $106,000 son of May Echo Sylvia, as he looked at 11 months of age weighing 1085 pounds. Some great heifers and cows bred to him will be sold at Sacramento, March 27, by Carnation Stock Farm, Seattle.

Wide Interest in Pig Clubs

Frank B. Anderson, Sacramento, secretary of the Western Berkshire Congress, has been asked by the farm adviser of Sacramento County to assist in locating at least 50 head of weanling Berkshire pigs to be placed among the members of a recently organized pig club.

Anderson says that from reports reaching him there is a growing interest in pig club work throughout the state and that several hundred pigs will be required from swine breeders.

Chimacum Spring Farm King Pontiac

Heading the choice herd of registered Holsteins owned by Albert E. Smith, Sumas, Washington. Several high class cows bred to him, and a beautiful daughter of his out of a 30 pounds junior four year old daughter of a 30 pound cow will be sold in the Guaranty Sale, Sacramento, March 27, by Mr. Smith.

Orland Jersey Breeders' Meeting

Dr. H. W. Hand, president of the Orland Jersey Cattle Club, announces that the annual meeting will be held at Orland the evening of March 26. Following the usual custom, a banquet will be served. An interesting program has been arranged, a feature of which will be an address by a representative of the American Jersey Cattle Club.

Dr. Hand will make an address which will be illustrated with colored lantern slides.

Slocum Goes East for Durocs

Clayton N. Slocum, junior member of the firm of H. P. Slocum & Son, Duroc-Jersey breeders of Willows, is now in the East for the purpose of selecting a carload of bred sows. Slocum brought out a carload of Durocs last spring and was so successful in placing them among his neighbors in Glenn County that that section is now one of the leading Duroc centers in the West.

Slocum expects to visit many of the leading herds of the Middle West and South. He will return about April 10.

New Firm in Horse Business

The horse breeding interests of the state will be interested to know that H. C. Merritt, owner of the Tagus Ranch, Tulare, and C. W. Bowers, Davis, one of the best known horsemen on the Coast, have associated themselves together and propose to engage in the business of breeding and importing draft horses.

The headquarters of the new firm will be at Tulare, and, it is understood, will operate under the name of Merritt & Bowers.

Bowers was formerly associated with A. C. Ruby of Oregon.

Black Patti Going Well on Yearly Test

Black Patti, an unusually good registered Holstein cow, owned by Walter F. Mitchell, Visalia, has finished her first 100 days on test and has 343.76 lbs. butter and 7855.3 lbs. milk to her credit. She is being continued on test. This great cow has twice made above 26 lbs. butter in 7 days, and is such a choice individual that she was selected for the Guaranty Sale by the Committee of Selection and will be sold at Sacramento on March 27. It is to be hoped that she will go into the hands of some breeder who will continue her on yearly test to complete the record on which she has made such a promising start.

New Hog Feeding Facts

Professor J. I. Thompson of the animal husbandry department of the University of California announces that he will close a hog feeding test during the week that the California Swine Breeders' Association will meet at the University Farm and that the results will be given out at that time.

The test has been carried on for the purpose of determining the relative efficiency of several protein concentrates, including tankage, fish meal, and prepared buttermilk feeds. A similar test was carried out last fall and the conclusions to be drawn from the two trials should prove of great interest to all hog raisers.

Percheron Colts at State Farm

Professor J. I. Thompson of the animal husbandry department of the University of California writes that the first colts sired by that institution's new Percheron stallion, Aiglonel, have arrived, and that they are quite the best colts foaled at the farm.

Professor Thompson is of the opinion that values for big, sound draft horses are certain to touch high levels in the next few years, owing to the fact that the number of mares that have been bred during the past few years has shown alarming decreases each season.

More colts will be foaled on the University Farm this spring than in any former year.

Another 30 Pound Record in Higdon Herd

The newest 30 pound cow developed in the herd of registered Holsteins owned by W. J. Higdon, Tulare, is the great young cow Leda Hengerveld De Kol Korndyke, who has just completed a record of 30.87 pounds butter from 648.9 pounds milk in seven days, milking as high as 107 pounds in one day. She is a daughter of Korndyke Queen De Kol's Prince, and out of a half sister to Tilly Alcartra. She had a previous record of 27.42 pounds butter in seven days as a senior four year old, and was purchased by Mr. Higdon in the 1917 guaranty sale at Sacramento from A. W. Morris & Sons, Woodland. This richly bred young cow is only one of the many examples of the sound business principle that it pays to buy the best even if the initial investment is larger.

Phillips Buys Ormsby Heifers

J. P. Phillips, Fresno, recently made a notable addition to his herd of registered Holsteins through the purchase of a group of heifers carrying a large percentage of Ormsby blood. One of the most richly bred among them is a daughter of Sir Ormsby Banostine Champion, whose dam is the world's record cow Duchess Skylark Ormsby. The dam of this heifer is a 16.30 pound two year old daughter of Sir Korndyke Hengerveld De Kol, she in turn out of a 29.28 pound cow. The balance of the group is composed of daughters of Sir Ormsby Hengerveld Segis, Sir Korndyke Hengerveld De Kol 37th, Butter Boy Beets Banostine, Champion Johanna, and Colantha De Kol Pietertje 3d. Several of these heifers are in calf to a son of Duchess Skylark Ormsby, and the offspring should give Mr. Phillips something exceptionally good to work with. The Phillips herd is headed by a good son of Sir Pietertje Ormsby Mercedes, the greatest sire of yearly record daughters of the breed.

Poland Breeder Back from Army

J. H. Cook, the young Poland-China breeder of Paradise, has returned from his enlistment and is again in active charge of his Poland-Chinas.

When he enlisted the greater part of his herd was disposed of. He retained a couple of boars and seven or eight good sows. The boars retained are: Cook's Hancherdale Jones, a grandson of Gerstdale Jones, and Big Ben's Wonder, a son of the Pfander boar, Big Ben.

Among the sows retained Mollie Wonder 2nd is the outstanding individual, being an excellent specimen of the breed and entitled to rank as one of the best Poland-China sows on the Coast.

Mr. Cook's particular fancy, however, is Long Jumbo Fashion, a sow very similar to Mollie Wonder 2nd, but a trifle smaller. She has regularly farrowed from eight to ten pigs and raised them all.

Mr. Cook is planning some decided improvements the coming year which include the removal of the herd from his Forrest View Ranch to another, just south of Chico, on the National Highway. This new location he believes will put him in closer touch with the markets, and be more accessible for those desiring to visit his herd. Additional animals will be added to the herd from time to time, and with no bad luck he will have a show herd at the Sacramento State Fair this fall.

The proposed bill to revise the livestock brands has now passed the Arizona legislature and become a law.

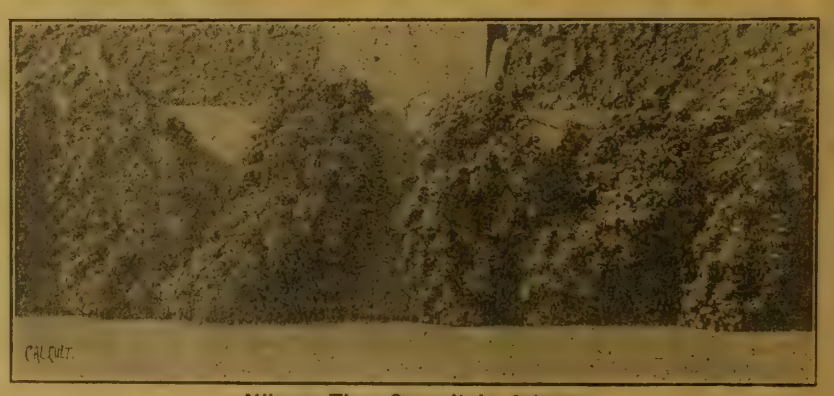
Horse Still a Going Concern

Horses are hardly maintaining their number on farms in this country, in consequence of the auto truck, the automobile, and the needs of war, and yet there are nearly as many in the country now as a year ago, according to the bureau of crop estimates of the United States department of agriculture. Furthermore, there are now one-third of a million more than at the beginning of the war. It was expected that the war would stampede the horse market in this country and would send prices high enough to rob the farms of a large number of much needed work animals, but there was no such shock as was expected. From 1910 to 1915 horses on farms increased a little each year, usually over one per cent, and since 1915 the increase of four years has apparently been over 300,000. The present total, according to the estimate, is 21,534,000 horses. The exports of horses during the war to December 31, 1918, have been slightly more than 1,000,000; at the prewar rate the normal exports would have been about 1?0,000. As far as covered by domestic exports, the war made an extra demand on farmers for almost 900,000 horses. To this must be added the extra demand of the United States government. By January 11, 1919, the war department had shipped overseas nearly 39,000 horses, and on November 2, 1918, that department had in this country nearly 165,000 horses. The apparent figures of extra demand on the farmers of the United States by this country and the allies for horses on account of the war make a total of about 1,100,000 horses in exports and in the service of the war department. The actual number is greater by the normal exports, and hence about 1,200,000 horses are indicated as the horse contribution of the farms to the war, not including private purchases and the United States government outside of the war department.

"Tillage is Manure"—Likewise Irrigation
This is the time of the year when the cultivator earns its keep.



Hogs in Salt River Valley

Written for California Cultivator By M. E. Bemis

ALFALFA and hogs always makes a good combination. In the Salt River Valley alfalfa grows to perfection. There may be places where alfalfa will do as well as here, but nowhere will it do better. Records of ten to twelve tons of hay are frequently reported. Pasturing alfalfa is not commonly considered good practice, but less injury results from pasturing here than in most places. This is due to favorable climatic conditions which induce a rapid growth of the plant, and therefore the tendency is to soon recover from any injury which it may receive from pasturing.

From 14 to 20 shoats may be carried on each acre of alfalfa, or two sows with pigs. With reasonable care there is not much injury to alfalfa in pasturing to this extent, though it should always be borne in mind that alfalfa that is pastured will deteriorate more rapidly than fields that are not pastured. All hog growers in the Salt River Valley agree that there is good profit in growing hogs up to about 150 pounds each. With high priced feed there is some question among hog growers regarding the profits from fattening. Some figures obtained recently from reliable sources throw some light on this question.

County Agricultural Agent H. C. Heard, cooperating with W. E. Schneider, swine specialist for Arizona, of the United States bureau of animal industry, conducted the experiment on the farm of K. S. Townsend, south of Phoenix. In this experiment two groups of hogs were fed approximately 60 days. The purpose of this experiment was to show the relative value

Contagious Abortion

Don't sell the aborters. Clean out the infection. Breeding animals are worth more than ever before. Control of Abortion is doubly necessary.

The Abortion infection causes Barrenness, Retention of Afterbirth and Calf Scours in addition to Abortion. Unless checked it is likely to run through your entire herd.

B-K is a powerful non-poisonous antiseptic—scientifically correct for this work. Used as a douche, it dissolves the slimy albuminous matter in the vagina and uterus, kills the germs, stops discharges and controls the infection. B-K is much more effective than lysol, carbolic acid, Lugol's solution, bichloride of mercury and coal tar disinfectants, all of which tend to coagulate or thicken the albumins.

Contagious Abortion is being successfully controlled in many herds by following our simple plan with B-K. Send for "evidence."

FREE BULLETINS: Send for our valuable bulletin No. 52 on "Contagious Abortion," also "145 Farm Uses" and our "Trial Offer." If your dealer does not have B-K send us his name.

Correspondence with the advertisers in the California Cultivator will convince you that their articles will save you money.

of milo and hegari. This was ground in the head, that is the unthreshed grain.

The feed used with one lot was 80 per cent ground milo, 15 per cent ground barley and five per cent cotton seed meal. The other lot received 80 per cent ground hegari, 15 per cent ground barley and five per cent cotton seed meal. Approximately no difference was found in the food values of these two grains. Incidentally this proves the advantage of hegari over milo as this grain sorghum produces somewhat heavier yields usually, while the forage has considerable more food value. It was found that it required 450 pounds of the above grain rations to produce 100 pounds of pork.

The cost of these feeds was: Hegari and milo, $2.50 per cwt., ground barley $3.00 per cwt. and cotton seed meal $3.00 per cwt., making the cost of the mixed feed $2.60 per cwt.; and the cost of producing 100 pounds of pork $11.70. As the pork sold for $16 per cwt. this shows a good profit in finishing.

Further light on the question of profitable hog raising is shown by the reports of the boys' pig clubs. In these clubs very accurate records have to be kept regarding the weights of pigs at the beginning and the close, the cost of feeding and profit. In these clubs it was found that the daily gain ran from six-tenths of a pound to two pounds per day. The cost ran from eight cents a pound to 16 cents; the average cost was 10 cents a pound and the average daily gain was eight-tenths of a pound. The average profit per pig was $9.44. The combination of skim milk, ground milo and cotton seed meal has also proved profitable.

It has been found that one pound of cotton seed meal for each 100 pounds of pork and about four to five times the weight of the cotton seed meal in ground milo, together with what skim milk will be consumed, has produced a profit of about 14 cents a day for the period of finishing.

Rustling Their Own

A husky bunch of porkers that with the right chance—which means plenty of milo—will make pork at a profit.

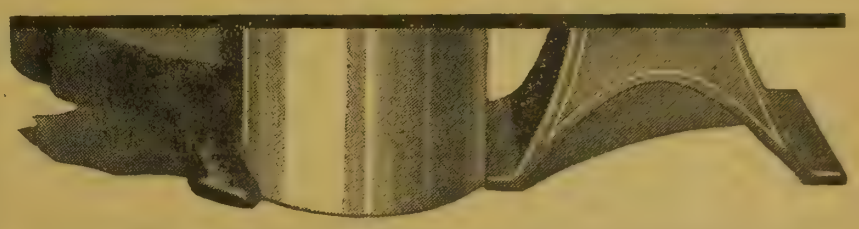
Eczema

Eczema in farm horses is a non-parasitic disease of the true skin, caused by pressure or chafing of saddle or harness, especially at the time of change of coat; extremes of heat or cold, exposure to wet, want of cleanliness, bad feeding and constitutional disturbance. These produce inflammation of the underskin or dermis, as distinguished from the outer skin or epidermis. The symptoms are small nodules on which the hair stands upright and becomes knotted; scabs form, which become detached, and leave bare patches; the irritation is great, and rubbing makes it worse. Eczema may attack the mane or tail, while grease and mud fever are simply forms of the same disease. The scabs should be softened with glycerine, then washed with warm water and hard soap. After drying thoroughly, a lotion composed of one part each of lead acetate and zinc sulphate in 40 parts of water should be applied. If this does not cause a change, an application of oil of tar is recommended by a veterinary surgeon. A change of food and provision for shelter should be made. As the system is generally out of order, a ball should be given and followed up by soda hyposulphite one-half ounce twice a day. If the system is badly deranged, Fowler's solution of arsenic, two to eight drams, may be given, and sulphur, two ounces to four ounces, added to mash of gruel once a day. The horse should be kept clean during treatment by grooming. —The Australasian.

Wire Gause Inefficient

According to reports from about 40,000 farms, wire-gauze strainers are in more general use than any other kind, but studies with the microscope show plainly that the meshes are much too large to hold back any but the very course impurities. One thickness of cheesecloth or other cotton cloth is only slightly more effective than a wire-gauze strainer, but when the cloth is folded to about eight thicknesses its ability to remove dirt in milk increases somewhat, but is still inefficient as compared to absorbent cotton or filter cloth.

Filter cloth, a specially made cotton cloth, smooth on one side and "fuzzy" on the other, is reasonably effective. This cloth can be obtained from leading dairy supply houses. The milk should be poured on the fuzzy side, the fibers of which stand up like the nap of a carpet and remove all but a small percentage of the solid impurities. The most effective strainer of all, however, according to experiments, is a layer of absorbent cotton placed between two thicknesses of cheesecloth.



Clean Production Recommended

At best, straining milk is a practice that makes milk appear clean and therefore more easily salable, but no strainer removes either the bacteria and objectionable flavors, or the very fine dirt. As a consequence straining milk fails to improve its wholesomeness to any noticeable degree. Clear milk is best obtained by sanitary methods which prevent, so far as possible, the entrance of dirt into the milk. This can be done best by having clean cows in a clean stable and milking with clean hands into sterilized small-top pails.

Eight Good Reasons Why You Should Buy a

DE LAVAL

GREATER CAPACITY: New capacities have been increased 10 per cent, without increase of speed or effort required in operation.

SKIMS CLOSER: The improved bowl design, together with the patented milk distributor, gives greater skimming efficiency.

EASIER TO WASH: Simple bowl construction and discs caulked only on the upper side make the bowl easier to wash.

EASIER TO TURN: The low speed of the De Laval bowl, the short crank, its unusually large capacity for the size and weight of the bowl, and its automatic oiling throughout, make it the easiest to turn and least tiring to the operator.

THE MAJORITY CHOICE: More De Lavals are sold every year than of all other makes of separators combined. More than 2,325,000 are in daily use—thousands of them for 15 or 20 years.

TIME TESTED: The De Laval was the first cream separator. It has stood the test of time and maintained its original success and leadership for 40 years the world over.

EQUIPPED WITH SPEED-INDICATOR: Every New De Laval is equipped with a Bell Speed-Indicator, the "Warning Signal" which insures proper speed, full capacity, thorough separation and uniform cream at all times.

SERVICE WHEN YOU NEED IT: The worldwide De Laval organization, with agents and representatives ready to serve users in almost every locality where cows are milked, insures the buyer of a De Laval quick and efficient service whenever he needs it.

LIVE STOCK

20 Work Horses, Saddle Horses, mares and colts at a bargain. Ira E. Brown, Montague, Calif.

UNIVERSITY FARM PICNIC

The annual picnic staged each year by the student body of the University Farm will be held Saturday, April 26. Eleven years ago the few students at the Farm decided that it would be a good idea to set aside a day and invite their families and friends to visit the new institution and see what was being done. From that modest beginning the affair has grown to be one of the largest public gatherings held in the state. Last year it was estimated that 18,000 people visited the Davis institution.

The idea back of the picnic is to provide an opportunity to acquaint the public with the many activities carried on by the various departments of the college of agriculture.

GOOD REASON

During the lesson one afternoon a violent thunderstorm arose, and, to lessen the fright of the children, the teacher began telling of the wonders of the elements.

"And now, Johnny," she asked, "why is it that lightning never strikes twice in same place?"

"Because," said Johnny confidentially, "after it hits once the same place ain't there any more."

CITRUS FERTILIZATION

Continued from Page 357

relationships and moisture conditions undergo improvement. At the same time the solubility of the plant food constituents already in the soil becomes increased, notably so in the case of calcium, an element that has especially important functions in the physics of soils as well as in the physiology of citrus trees.

Vital Processes

In addition all of the vital processes going on in soils are closely related to and, in most cases, utterly dependent upon, organic matter, but it should be clearly understood that organic materials to be effective, physically, chemically or biologically, must be susceptible of being decomposed by the bacteria and fungi of soils, and that, too, at a somewhat active rate. For, as intimated above, it is not so much the organic materials as such as it is the products formed in their decay, that are important

In this connection cover cropping naturally suggests itself. The value of cover cropping depends largely upon the organic matter furnished by the cover crop. It is true legumes probably also add considerable nitrogen, an element much needed, but one of their greatest values lies in the physical and chemical effects produced by the soluble products formed in their decomposition and the fact that a part of their organic structure actually grows and penetrates into the subsoil, where it later decays, thus tending to open up the subsoil and improve its physical nature. This quality especially recommends cover cropping for the interior valleys. Other things being favorable, I consider that leguminous cover crop to be most valuable, whose root system is most extensive and which sends down the greatest number of comparatively large roots to the greatest depth.

Under the present system of summer cultivation a considerable part of the cover crop that is produced above the ground, even though it be thoroughly plowed down or otherwise worked into the soil, becomes dissipated, owing to the fact that the decay processes take place out of reach of citrus roots, and the physical effects are produced in that portion of the soil that ordinarily least needs it. The plowsole zone is where the decomposition ought to take place if possible. Herein lies the fundamental reason why I believe in the incorporation of organic matter, whether it be grown as a cover crop or applied as manure, bean straw, etc., to a depth below the usual summer cultivation.

Importance of Physical Condition

It must be evident that my purpose in referring to these matters is to point out and emphasize the importance of decaying organic matter in the maintenance of good physical condition, the results of which make it possible for other fertilizers that may be applied, or the plant food contained in the soil, to become as effective as possible. It may be possible to secure satisfactory results under some conditions without the addition of any organic matter, at least for a time, but later the need for it is almost certain to be felt and without it the efficacy of inorganic materials will depreciate.

In my opinion the use of commercial fertilizer should always be coupled with the use of organic material, and the permanent prosperity of the fertilizer business, so far at least as citrus culture is concerned, hinges in a large measure on the active cooperation between its use and the use of organic material. I wish to state here that I am a strong believer in properly chosen commercial fertilizers and frequently recommend their use, but I also wish to call attention to the necessity, either at present or in the near future, of replenishing the organic content of soils also, and if this be not done the efficacy of the commercial fertilizer will sooner or later depreciate. In my opinion the fertilizer business should be combined with the manure business or cover cropping and with such a union there is a definite field for the use of fertilizers.

Nitrogen—More Nitrogen

Concerning the use of nitrogen, phosphoric acid and potash as such, I have very little to add to what has been stated and repeated before citrus growers many times already. Among those constituents nitrogen is by far the most important, and its use is indispensable to the permanent well-being of practically all citrus orchards. Citrus trees absorb large amounts of nitrogen; the unavoidable losses of nitrogen from soils are considerable in spite of all precaution; the response of citrus trees shows the beneficence of available nitrogen. All the evidence, in a word, bespeaks the use of nitrogen. As a source of nitrogen leguminous cover crops will make their contribution, but in my opinion it is not probable that any system of cover cropping can be devised that will fully meet the nitrogen requirements of a citrus orchard, I am sure that the usual winter cover crop, at least, does not accomplish this purpose. Manure and bean straw, where used liberally, will provide much of the deficiency, but in addition to these, unless they be provided in liberal amounts, the application of a concentrated, commercial form of nitrogen will also produce good effects.

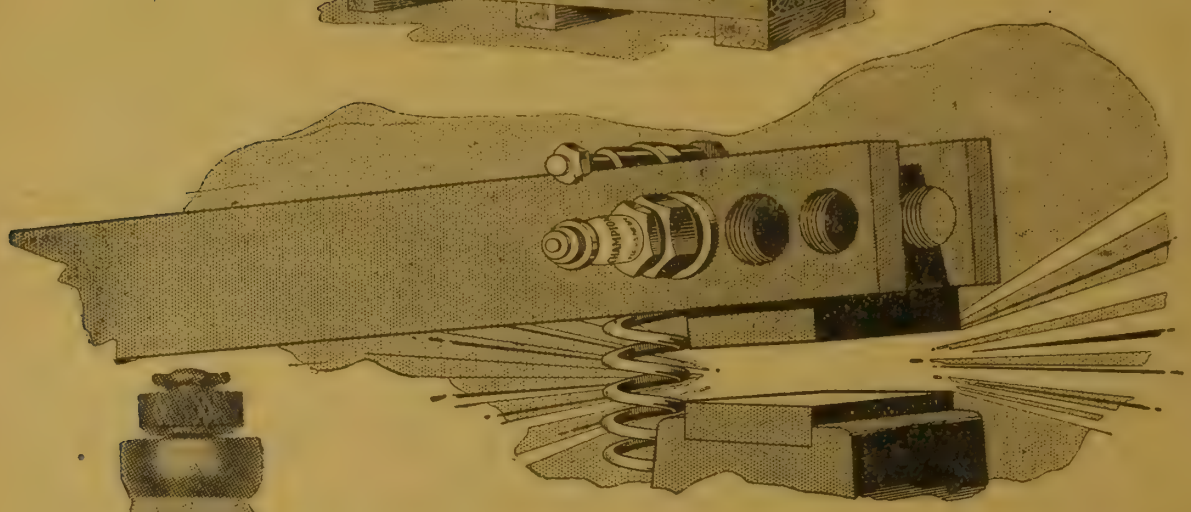
As a source of commercial nitrogen I believe there is very little choice between ammonium sulphate, dried blood, tankage, guano, fish and meat scraps and possibly a few others. The price should largely regulate the choice. Ammonium sulphate will probably become effective a little quicker than the others. In regard to the use of nitrate of soda it can be positively stated that the plant food element, nitrogen, which it contains, is not only the most needed of all the elements of fertilizer for this section, but it actually exists in nitrate of soda in its most available and effective form. The only reasons, so far as I am able to see, why nitrate of soda is sometimes objectionable, lie in the fact that its use tends to accelerate the ever present tendency in many soils toward the formation of compacted and otherwise unfavorable physical conditions and, secondly, it contains soluble sodium, the base of the greater part of objectionable alkali. It is certainly desirable to avoid the addition of any further amounts of alkali producing material and to delay as far as possible the development of unfavorable physical conditions. There is little room to doubt that the use of nitrate of soda has in some cases actually produced injury through these very means.

Phosphorus—A Little

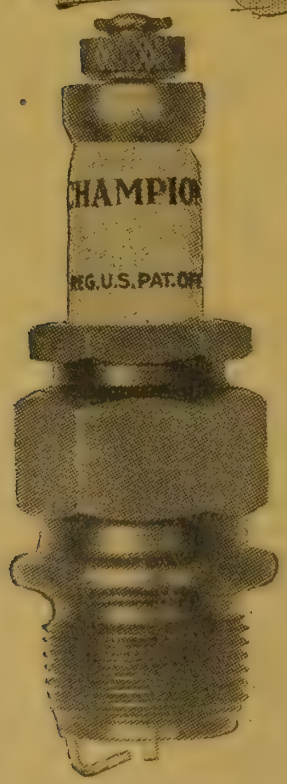
The next most important constituent in fertilizer is phosphoric acid. It is desirable to use some phosphoric acid over a large part of the citrus area, but the needs for phosphoric acid are by no means as great as for nitrogen. I am not prepared to state whether the amount of phosphoric acid provided in the liberal use of manure or bean straw will suffice, but where neither of these materials are used either superphosphate or high grade tankage are suitable. Considering phosphoric acid, pure and simple, it appears probable that superphosphate would be superior to other forms, but in view of the nitrogen which it contains, tankage is probably just as economical and possibly more so.

Potash?

Finally, regarding potash. I regard the evidence to be conclusive that there is very little if, indeed, any reason for applying any potash whatever to the citrus groves of California.



LACK OF LUBRICATION IS EXPENSIVE



Watch the lubrication on your automobile and tractor if you would avoid cost of repairs. It is cheaper to buy oil than to buy machinery, says E. W. Lehmann of the University of Missouri college of agriculture. Use only lubricants of best quality. The manufacturer will advise you which brand of oil is best for the particular machine. Keep oils and greases protected from grit and dust. See that all oil containers are cleaned before using. Carefully follow oiling chart in lubricating your machine. A small amount of oil at regular intervals rather than an excess of oil occasionally is best for all machinery.

CHAMPION TRADE MARK

Champion Dependable Spark Plugs

Champion 7/8-18
Price $1.00

Withstand Shocks of 300 Sledge Hammer Blows Per Minute

The results of various exhaustive factory tests imposed upon Champion Spark Plugs completely demonstrate their ability to endure every punishment your car's engine can impose.

The test illustrated here is known as the "shock test." The shock, which the Champion Spark Plug must survive without injury, is the equivalent to a weight of 3½ pounds, dropping with the rapidity of 300 times per minute.

The qualities that enable Champion Spark Plugs to successfully withstand such severe trials are largely a result of ten years' study and experimenting that developed our patented gasket construction and our Number 3450 insulator.

This superior Insulator offers 2½ times the resistance to shock and vibration compared with the best previous insulator. That is one of the several reasons why Champion Spark Plugs are more durable and dependable than ordinary spark plugs.

There is a Champion Spark Plug for *every* type of motor car, motor truck, tractor, motorcycle and stationary engine.

Champion Spark Plug Co., of Canada, Limited, Windsor, Ontario

HOW TO USE CARBON BISULPHID IN GROUND SQUIRREL CONTROL

The rodent control division of the state horticultural commission gives out the following information regarding the use of carbon bisulphid for killing squirrels:

Carbon bisulphid applied to ground squirrel burrows when the ground is fully saturated with moisture, is by far the most satisfactory material to use. Wasteballs soaked in this liquid are sufficiently loose to allow vaporization of the carbon bisulphid. Diffusion is thereby accomplished, after which the gas can be exploded in order to force the products of such combustion to the farther recesses of the burrow. Every burrow must be treated with one soaked wasteball, and following the explosion be covered with one or more shovelfuls of earth. This earth covering must be tightly tamped. Exploding is accomplished with a match or a torch after allowing from four to ten minutes for vaporization of the carbon bisulphid, depending upon temperature and weather conditions. On a cold, foggy day eight or ten minutes should elapse before exploding.

Carbon bisulphid is most easily handled in an open bucket or pail. Fill the pail about three-fourths full of the liquid carbon bisulphid and place in same enough jute wasteballs to be covered by the liquid. To prevent evaporation a thin film (¼ in.) of water can be poured over the carbon. Each wasteball holds enough carbon bisulphid which, when vaporized and mixed with air, forms a gas of sufficient concentration and strength to kill a squirrel.

Wasteballs can be taken from the liquid by means of a hook, pointed stick or forceps, using one wasteball to each burrow. After introducing the wasteballs, a period of time should be allowed to elapse to insure proper vaporization of the liquid. This will depend upon weather conditions, for instance, a warm day would call for four or five minutes; a cold, damp day as long as ten minutes. This period can be utilized by placing balls in other burrows. Following the waiting period a match or torch can be applied to explode the gas formed. A good torch can be made by hooking a wasteball on the end of a stiff wire and dipping in carbon bisulphid or kerosene. Such a torch will burn for some time. This explosion will tend to force the gas to the more distant recesses of the burrow, hence insuring better distribution of the gases formed by the explosion.

Immediately following this treatment every burrow should be sealed with damp earth and very tightly tamped to prevent the gas from escaping. Carbon bisulphid should be used only when the ground is sufficiently damp to prevent the gas from escaping, through cracks or porous earth. When properly applied it will produce a killing not approached by any poisoning method.

Exceptional precautions must be observed to keep fire away from containers holding carbon bisulphid in view of the extremely explosive nature of the material.

VICTORY LOAN

The following telegram from Secretary of the Treasury Carter Glass explaining tax exemption features of the Victory Liberty Loan Act has been received by Governor James K. Lynch of the federal reserve bank:

"It is perhaps not generally understood that under the terms of Section 2(a) of the Victory Liberty Loan Act, the interest received on and after January 1, 1919, until the expiration of five years after the termination of the war, on an amount of bonds of the First Liberty Loan converted, the Second Liberty Loan converted and unconverted, the Third Loan and the Fourth Liberty Loan, the principal of which does not exceed $30,000 in the aggregate, owned by an individual, partnership, association or corporation, will be exempt from surtaxes, excess profits and war profits taxes now or hereafter imposed by the United States, upon the income or profits of individuals, partnerships, associations or corporations.

"Not only is this exemption in addition to all other exemptions heretofore conferred, but it is independent of any subscription to the Victory Liberty Loan, and is immediately effective. The Victory Liberty Loan Act also contains a provision authorizing the secretary of the treasury to extend the privilege of converting four per cent bonds of the First Liberty Loan converted and four per cent bonds of the Second Liberty Loan into four and one-quarter per cent bonds, the higher interest rate to be effective from the semi-annual interest payment date next succeeding the date of presentation for conversion.

"Having recommended that this conversion privilege be so extended, I shall of course very promptly exercise the authority thus conferred upon me and issue regulations covering the details."

"KAISER" PEA CHANGES ITS NAME

Farmers who want to buy quantities of the variety of field pea introduced several years ago by the United States department of agriculture from Germany, and then known as the "Kaiser" pea, will save trouble by not using that name any more. These peas are now known as "McAdoos," and they are as widely distributed through the Northwest as "Liberty bonds," which caused the substitution in nomenclature.

A NEW MORNING GLORY SPRAY

An arsenical spray has been evolved by Prof. Geo. P. Gray for the control of the morning glory pest. Examination after spraying shows that the arsenical has been absorbed by the roots to a depth of one foot underground and is still working downward.

From reports received the results are encouraging and the remedy promises to prove efficacious. The proportions of the spray ingredients are given as follows: White arsenic (arsenic trioxid 99 per cent), 12 pounds; caustic soda (lye), 6 pounds; water, 3 gallons. Dilute this stock solution to 300 gallons for spraying.

CANNERY TOMATOES IN ALAMEDA COUNTY

Mr. Fred Drew, manager of a cannery at Niles, asked as to the most desirable varieties of tomatoes for canning, says:

"The most desirable tomatoes for canning are the San Jose Stone, as the skin is very smooth and free from wrinkles, making them easily handled and there is practically no waste. They bear big crops on heavy black soil. Around Niles 30 tons to an acre has been the yield at times. Last year (1918) the yield was light on account of a midseason rain that damaged the crop. Tomatoes in 1918 brought $18 a ton.

"We used some tomatoes from the San Joaquin Valley (Manteca). As the soil was sandy the fruit was small but firm and ideal for catsup or hot sauce."

NEW COUNTY HORTICULTURAL COMMISSIONERS

Several new appointments of county commissioners were made during February. They are:

Amador County, Commissioner J Marchant, Ione. Calaveras County, Commissioner J. B. Luddy, San Andreas. Mendocino County, Commissioner E. W. Dutton, Ukiah; inspectors, J. S. Cotton, Fort Bragg; E. R. Herbert, Albion; S. E. Brooks, Hopland; Will Van Dyke, Ukiah. Solano County, Commissioner G. M. Gates, Vacaville.

IMPORTATION OF AMERCAN APPLES

With 600,000 cases of apples in cool stores in Australia, the importation of American apples will not be permitted, says the London Times.

All Praise the Essex—$1,395

A New Car That Men Have Long Wanted

Thousands Ride In It—Will You?

Note what all are saying about the Essex.

In hundreds of cities it has awakened a greater motor car interest that anyone has seen in years.

Close to a hundred thousand have ridden in the Essex. Ten times as many have been to see it.

The qualities in the Essex which appeal most are those very qualities that are most attractive in the light, cheap car and those of the large, costly one. They are comfort, riding ease, endurance, and elegance at a moderate cost for purchase and operation.

Every Essex Sales Room Now Holds Motordom's Interest

People instantly admire Essex beauty. They speak of the detail and care with which it is finished. They note its lines and talk of features that have been exclusive to costly cars. They are enthusiastic over its riding qualities as shown over rough roads and worn-out pavements. The Essex does not pitch its passengers about. It remains rigid and firm and free from rattles and squeaks no matter how rough the service. There is no need to drive miles out of the way to avoid a rough stretch of road. It goes over the worst roads like a big, costly car.

The Essex is demonstrated on the same steep hills that are used to prove climbing ability by high-powered and costly cars. Speed is shown over the same course that fast cars are demonstrated. Its acceleration is compared to the few cars noted for such performance.

Buyers Being Placed On Waiting List

Dealers have already booked orders for more cars than they are scheduled to receive before midsummer.

It is doubtful if anyone will be able to get an Essex as promptly as he may want it. But by ordering now the delay won't be quite so long.

ESSEX MOTORS

(E-25)

This CONCRETE Manure Pit *will cost you nothing*

The horses and cows will pay for it.

Unless stable manure is kept so that the valuable liquid contents are saved, 50 per cent of the fertilizing value of the manure is lost. An average horse or cow produces annually manure worth $35. The liquid portion is worth nearly half of this. ***A concrete manure pit will save it all.*** So you see how the horses and cows can present you with a concrete manure pit free of charge.

Build one now and get the profits from this form of saving.

Ask for our free booklet telling how to build Concrete Manure Pits. Write our nearest district office.

POULTRY

Prices to producers: Hens, 34; broilers, 42@50; fryers, 42; roasters, 34; old roosters, 20; ducks, 34; ducklings, 34@35; geese, 28; turkeys, 36@37; squabs, 40@43.
Belgian hares, 16.

LIVE STOCK

By F. P. Allen, Bureau of Markets, Los Angeles

At the prices now paid for current receipts of beef cattle, which are only half fat, finished beef or even three-quarter fed beeves would bring a price about in line with what the average producer considers his herd worth. Prices quoted on the Eastern markets show a $20.00 top but scarcely more than one per cent of the receipts measure up to that standard of quality known as prime. The bulk of sales are made at $14.75 to $17.00 in Chicago and the cattle that sell for these prices are coming from the corn belt states, but are only half fat. So it can easily be seen why this market will not stand a higher price level for steers under present conditions, unless export orders are allotted to local killers and cattle are offered that will qualify to fill those orders. The local market is steady for steers and firm for good cows.

The market is adequately supplied with hogs, and the quality of the receipts is fair. No. 1 hogs of the desired weights still sell for $16.50 f. o. b. Los Angeles.

A few lots of spring lambs have arrived and their quality is very good, but they do not sell very readily on account of the high price that is naturally expected of them. Retailers declare that their trade will not pay the price no matter how good they are. Other lambs are steady for good to choice and weak for lesser grades. Yearlings and wethers are in light receipt and sell steady to strong.

Ewes receipts have been liberal and only light weight good quality are able to make a good clearance.

Reports compiled by the bureau of markets indicate that Los Angeles City is an important live stock market. The following figures represent the receipts of live stock by classes for the month of February, 1918.

Steers 4339, cows, 5776, bulls 435, total beef 10,550; calves 2142, hogs 19,794, lambs 15,156, wethers 909, ewes 3197, total sheep and lambs 21,454; goats 11. Total head

Good steers	13.00@14.50
Medium steers	11.00@12.50
Common steers	9.00@10.50
Good cows	11.00@12.00
Medium cows	9.00@10.50
Common cows	6.00@7.50
Hogs No. 1, 175-225 lbs.	16.00@16.75
Hogs No. 2, 250-400 lbs.,	14.50@15.50
Lambs No. 1, 65@80 lbs.	16.00@16.50
Wethers No. 1	11.00@12.00
Ewes	8.00@10.50

POTATOES AND ONIONS

These are the actual prices obtained March 11 by Los Angeles wholesalers in in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms cash on walk.
on walk.

Demand and movement moderate. Stockton, Burbanks, quality and condition generally good; sacked per 100 pounds, fy., 2.50; resorted, 2.65; ch., 2.00; Idaho Russets, quality and condition fair, 2.25; rurals, 1.75; Oregon, seed stock, White Rose and Red Rose, sacked per 100 pounds extra fy. 2.60@2.65; fy. 2.35@2.50; ch., 2.10; Idaho Russets, quality and condition fair, 2.00@2.10; Oregons, seed stock, White Rose and Red Rose, sacked per 100 pounds 2.85@3.00; Homegrowns, White Rose, best mostly 2.75@3.00.

Carlot sales to jobbers: Stockton Burbanks, sacked per 100 pounds, extra fy. 2.40. Fancy no sales reported. Choice, 1.90@2.00. Idaho Russets sacked per 100 lb., 1.90@2.00.

Sweets, lug box best 90@1.00; sacked 3.00@3.10 per cwt.; poorer, 2.50.

Onions: Demand and movement moderate. Little change in prices. Stockton, sacked per 100 lb.; Browns, best from cold storage, 4.50@5.00; White Globes, 9.50@10.00. Homegrown Green Onions, 15 bunch.

VEGETABLES

These are the actual prices obtained March 11 by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes, doz.	1.35@1.60

Cabbage: Sales to retailers, best cabbage, 1.25@1.50 crate.

Carlots: Shipments increasing. Demand good, little change in prices. Quality and condition good. Carloads f. o. b. cash track. Early Winningstadt, California crates, 30.00 ton, crates extra.

California stock ranged 2.75@3.50 per crate in the Middle West. Saturday's shipments of old stock were heavy, of new stock moderate.

Carrots, doz.	45

Cauliflower: Best in cabbage crates, 1.75@2.00; poorer 1.25@1.50.

Carlots: Heavy movement over. Demand moderate, little change in prices, quality and condition generally good, carloads f. o. b. cash track, best stock in pony crates, 1.30@1.35.

California stock was steady at 1.25@1.35 crate carloads f. o. b. cash track at shipping points and was stronger in Northeastern markets at a range of 1.75@2.25 and showed an even more marked gain in the Middle West, advancing there to 1.65@2.25.

Celery: Homegrowns, best, 8.00@8.50; poorer, 5.00 per crate.

Carlots: Supplies practically exhausted. Quality and condition very poor. No carlot sales reported.

Lettuce: Wide range in prices. Sales to retailers: best in cal bage crates, 2.25@2.50.

Carlots: Demand and movement good, little change in prices. Quality and condition generally good but mostly small. Carloads f. o. b. cash track: Iceberg, California crates, Imperial Valley district, 4s and 5s best, 3.75, smaller, 3.25@3.50, Los Angeles district, few sales, supplies scarce, best 3.25.

Imperial Valley stock was firm at shipping points and held steady at 5.00@5.50 in most leading terminal markets, but declined to 4.50@4.75 in Chicago and advanced to 5.00@5.50 in Kansas City.

Parsley, doz.	20@25
Peas, Imperial Valley, lb.	13½@14
Peppers, Chili, lb., best	25
Bell, lb., best	30
Pumpkins, lb., best	1½
Radishes	15
Rhubarb, Crimson, box	1.85
Spinach, doz.	15
Squash—Hubbard, best, lb.	2½@3

Tomatoes, Mexico, condition generally good; best, 3.25@3.50 lug bx.

Turnips, doz.	25

FRUITS

These are the actual prices obtained March 11 by Los Angees wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Apples: Bellefleurs, fy. best, medium size, 2.25-2.50; loose, 5-6c lb. Yellow Newtowns, fy. medium size, 3.00@3.50; loose, 7 lb.; Oak Glen, Rome Beauties, Pearmains and Winesaps, large 3.50. Yucaipa, Delicious, fy., 3.00-3.50; King Davids, 2.50-2.75.

Pears: Winter Nellis, lb., 6@7.

Lemons: Fy. packed, 4.00@4.25; local pack, 3.00@4.00; loose, some tree ripe, 1.75@2.00.

Oranges: Navels, medium and large size, fy., 4.50@5.00; local packed, 2.75@3.00; loose, 3½@4 lb.; Tangerines, 6@7 lb.,

Grapefruit: Local fy., 2.50@3.00 bx.; Imperial Valley, 3.00@3.25.

HONEY

Practically no demand or movement. Supplies practically exhausted, prices lower. Carloads f. o. b. usual terms, Los Angeles, and common rate points. Asking prices: Extracted, lt. amber, alfalfa, 17@18; white orange, and lt. amber sage, 20 lb., Comb, lt. amber, alfalfa, fy., case 5.50; No. 1, 5.00; No. 2, 4.00 case. Beeswax, bright yellow and yellow, 37½@40 lb.

BEANS

Demand and movement slow, prices slightly lower. Warehouse cash to growers, choice recleaned basis, sacked per 100 pounds, Limas, best 6.25@6.50; poorer, 6.00; Small Whites, 6.25@6.50, quality and condition ordinary. Large Whites, quality and condition poor, 5.25@5.50; Henderson Bush, best 6.00@6.25; Black Eyes, quality and condition ordinary, 3.00@3.10; Tepary: no sales reported.

GRAIN AND FEEDS

For government prices on wheat see San Francisco market.

Carlot prices on local grain exchange.

Corn, sacked Yellow, 2.57½; White	2.50
Wheat	38.00@38.50
Milo	2.83¾@2.36¼
Barley	2.02½
Egyptian corn	2.50
Feterita	2.52½
Middlings	44.00
Bran	36.00
Standard Alfalfa	18.00@20.00

HAY

Quotations by Nichols - Loomis Company. Following are prices to growers, f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices:

Tame Oat	20.00@25.00
Barley	18.00@23.00
Alfalfa	16.00@20.00

The Alfalfa Growers of California, Inc., 525 Central Bldg., Los Angeles, furnishes the following quotations on alfalfa hay. Below are its selling prices to carload purchasers f. o. b. cars Los Angeles:

No. 1 dairy	24.00@25.00
Standard dairy	21.00@22.00
Standard Alfalfa	15.00@19.00

San Francisco Markets

San Francisco. March 11, 1919.

BUTTER

Quotations made daily by the San Francisco wholesale dairy produce exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by wholesalers to producers are eight per cent less.

The quotations on butter are on the basis of solid packed cubes. To ascertain the market price of butter in squares, add to the cubes basis price per pound as follows:

Two-pound squares, parchment wrapped, ½c; 1-pound squares, parchment wrapped, 1c; 2-pound squares in cartons, 1½ to 2½; 1-pound squares, in cartons, 2c to 3c.

Dairy Exchange quotations, lb.:

Extras	59
Prime Firsts	Nominal

Prices extras past week and year ago:

Rcts. wk. ending March 10, 13,429 cases.

POULTRY

Heavy arrivals of young stock in the local market Tuesday caused the prices of broilers and fryers to drop. Hens also declined from 1 to 2 cents. Dealers now state that this week will see a decline from the abnormal prices which have prevailed for several weeks. Indications point to continued increased receipts in the small chickens.

We quote to producers, lb.:
Hens, 37@40; broilers, 56@58; fryers, 60@61; old roosters, 23@25; young roosters, 39@41; turkeys, dressed, 41@44.
Ducks, 29@31; geese, 29@31.
Belgian hares, live, 16@18.
Jack Rabbits, 3.00@3.50.

POTATOES

Sales to jobbers—California Burbanks sacked per 100 pounds, fy., 1.90@2.00. United States grade No. 1, 1.65@1.85. Idaho Netted Gems, United States grade No. 1, 1.65@1.75. Rurals, United States grade No. 1, 1.50@1.65.

ONIONS

Storage cwt.,	4.00@4.25.
Australian, Brown	4.25@4.50

VEGETABLES

Wholesale selling price:

Artichokes, doz.	50@1.00
Asparagus, lb.	15@25
Beets	1.50@1.75
Brussels Sprouts, lb.	6@8

Cabbage, 50@75; street sales, Early Flat Dutch, bulk per cwt, 1.00.

Carlots: Demand and movement moderate, demand improving. Quality and condition generally good, prices higher. Carloads f. o. b. usual terms and cash track: Early Flat Dutch, California crates 27.00@30.00 per ton.

Carrots, sk.	1.25@1.50
Celery, cr.	8.00@8.50
Cauliflower, doz.	50@75

Carlots: Demand and movement good, quality and condition good, prices unchanged, carloads f. o. b. cash track, pony crates, 12s to 14s, 1.20@1.35.

Cucumbers, hothouse, bx of 30	4.00@4.50
Egg Plant, lb., local,	5@10

Millet	5@5½
Rape	2¼@
Hemp	5@5½

GRAIN

Barley: Feed, 1.85@1.90 per cental shipping, nominal at 1.95@2.05.

Oats: Red feed, 2.00@2.15 per cental seed, do, 2.50@2.75; recleaned, 3.00@3.10.

Corn: California yellow 2.50@2.6 per cental; Egyptian, 2.80@3.25 for dry

THE ARNOTT ENGINE HARROW

This is the strongest engine harrow of its type sold on the Coast. Heavy axles, heavy discs. Built for service. Do not accept any imitation said to be the same. Only one genuine "ARNOTT" eight, nine and ten feet wide. Write or call for full information.

ARNOTT & CO., Inc., 112-18 S. Los Angeles St., Los Angeles

and 2.30@2.60 for rain damaged. Milo maize, 2.60@2.75 for dry and 2.30@2.40 for rain damaged.

Wheat—Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Cental
No. 1	2.20	$3.62 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58½
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran, 42.00; shorts, 42.00; middlings, 42.00; rolled barley, 48.00 @50.00; alfalfa, 32.00@34; scratch feed, 3.75 per cental.

Citrus Fruit Market

Los Angeles, Cal., March 12, 1919.

The orange market is still exceptionally fine. New York had a flurry during the week owing to strike preventing receipt of the usual supply. When shipping situation was corrected, over half a hundred cars were thrown on the market in one day. The entire supply was taken with scarcely a ripple.

The lemon situation is still indifferent with very limited shipment going forward.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 9706 cars, lemons 2543, total 12,249. To same date last season, oranges 4709, lemons 1283, total 5992. Central California this season, oranges 2959, lemons 338, total 3297; last season to same date, oranges 1897, lemons 108, total 2005. Northern California, oranges 244, lemons 2; last year same date, 202.

AT THE AUCTIONS

Philadelphia: 6 oranges, 2 lem. Nav. 4.25-5.35, lem. 3.00-4.10.

MARKET NOTES

Lent affects the demand for meat but does not this year at least affect the prices.

Colorado reports owing to open winter and good feed livestock gains have been far better than usual. At Denver, present indications are that the eastern half of this feeding district will not market their bulk of fat steers until April and May, while the western half will be short of pulp and will sell their cattle earlier. Market prices of fat cattle will determine to some extent this movement, as they will influence the amount of concentrates that can be fed.

One day's shipments of carlots of mixed vegetables aggregated 26 cars as follows: Denver, 2; El Paso, 3; El Centro, 2; Fort Worth, 2; Baltimore, 1; Chicago, 1; Coalinga, 1; Kansas City, 1; Oakland, 1; Portland, 3; Prescott, 1; Pittsburg, 1; San Francisco, 3; Toronto, 1; Wichita, 1; New York 2.

The first spring lambs of the season were offered Thursday. Their quality was the best this market has had for many seasons.

There has been quite a noticeable decrease in the total kill of Los Angeles slaughterers, yet the supply of dressed meats has been adesuate. The unaccountable decrease in the demand for all classes excepting veal resulted in a rather dull market throughout the week.

The loadings of all classes of live stock during February, 1919, were 14 per cent more than those of the same month a year ago. This increase, however, was very unevenly distributed among the different classes of stock, cattle and hogs showing increases of 9 and 25 per cent respectively, while sheep decreased 1 per cent.

The artichoke crop is very late owing to unfavorable weather conditions. The quality and price are high. About half of the available stock is absorbed by the local demand. Eastern shipments are averaging five express cars daily and would materially increase with milder weather. Fields generally are looking good, but short crop is expected on account of lateness of season. Eastern shipments should be heavy about March 15.

A few small shipments of asparagus from Central California have already been made, but production will begin to count following a few warm days and nights. Beds are in good shape, indicating heavy yield as soon as weather gets warm. The recent cold rain storm was preceded by heavy white frost.

Cabbage in the Fullerton district shows a condition of 60 per cent. The quality is improving and carlot shipments have been increasing each week, but a light cutting is expected this coming week on account of the lower prices and slow demand. Growers expect better prices later.

Following is a preliminary estimate of the acreage of cantaloupes for western states for 1919: California: Imperial County, 13,822 acres; Los Angeles and Riverside Counties, which are carlot districts, 915 acres; Central Section, Turlock and other parts of the San Joaquin Valley, 7,130 acres; total California, 21,867 acres; Arizona, 4,560 acres; Nevada, 150 acres; New Mexico, 975 acres; and Colorado, 4,800 acres. This large acreage is subject to revision, especially in the districts not yet planted. The material increase involves some uncertainty in yields due to inexperienced growers and untried districts, but present indications are for a big production this year.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

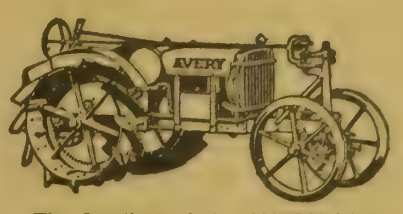
From post card reports to the Los Angeles branch of the bureau of markets, report is made of the following shipment of cars of products from California for the week ending March 10: Apples, 24; cabbage, 114; cauliflower, 144; celery, 15; dried apples, 16; dried apricots, 2; dry beans, 77; dried figs, 3; dried olives, 4; dried peaches, 10; dried pears, 1; dry peppers, 2; dried prunes, 36; lettuce, 148; mixed vegetables, 103; mixed fruit and vegetables, 20; mixed dried fruit, 8; onions, 34; pears, 1; peppers, 1; potatoes, 101; raisins, 81; spinach, 15; sweet potatoes, 1; turnips, 2; Mexican tomatoes, 13.

COTTON SEED EMBARGO

Imperial Valley planting of cotton for next season will be seriously reduced unless early relief is secured in the present cotton seed situation. Oriental grown peanut oil is taking place of cotton seed oil at 2 cents lower price per pound. Effort is now being made to secure action by federal war trade board. The L. A. Times reports:

"The situation became so critical that W. E. Keller came to Los Angeles and conferred yesterday with United States Senator Phelan. The result of this conference was a telegram to the war trade board, in which quick relief was asked. This telegram stated in substance, Mr. Abbot said:

" 'The Globe Mills in the Imperial Valley shut down and decline to make any further seed purchases, as they are blocked with over 5,000,000 pounds of oil on hand and no market. Cheaper low grade oriental oil is being imported and is glutting the market, although the California farmers had an understanding with the food administration representatives that when high price was placed on cotton seed no cheap oriental competitive oils would be permitted to interfere with the stabilization price. Globe Mills has paid $63 for wagon lots and $66 for car lots all through the season. Since they stopped buying, a competitive gin is offering only $53 a ton. Farmers claim they are entitled to stabilized prices and respectfully request that food administration do something to relieve the Globe Mills situation. Our information is to the effect that the food administration recommended an embargo on oriental oils, but that the war trade board declined to put the embargo on.



" 'It appears that compound manufacturing interests are opposing this embargo. For the interest of domestic industry it is paramount that this embargo be put into effect.' "

Avery Tractors and Motor Cutivators

The Smallest of the AVERY LINE

Avery 5-10 H.P.
Special Orchard Tractor

4 cylinder Motor
Enclosed Governor
High Tension Magneto
Hyatt Roller Bearings
3-Speed Transmission
Multiple Disc Clutch

This wonderful little tractor is the real orchard tractor and especially designed to meet the requirements of the **orchardist** with from 5 to 50 acres—is exceptionally low and turns in a 10½-ft. radius. We guarantee traction in any soil.

Note: Avery Sales and Service **is now** handled by **Avery Methods.**

Avery Tractors are made in **Seven Sizes,** from the small 5-10 H.P. to the large 40-80. A size **Tractor** for every size **farm. Avery Tractors** are built and sold by the **Oldest** and now the largest manufacturers of **farm power machinery** in the United States. Better to buy an **Avery** now, than to always wish you had.

Avery Motor Cultivator

It Cultivates

4-30-in. rows of beans **8-18-20-in. rows of beets**
2-36-44-in. rows of cotton or corn

6-cylinder Motor **3-speed selective type transmission**

"The Laboratory That Knows How"

A Novelty---A Wonderful Invention

Clock --- Calendar --- Barometer --- Thermometer

The world continually advances towards perfection, and the mind of man is ever producing greater and grander works.

One of these marvelous works is the CLOCK-CALENDAR-BAROMETER-THERMOMETER, which is illustrated here.

If you have, perhaps, already seen a clock like this then you know well that this clock is the best, most practical and most stylish at present; and it is wonderfully constructed so that it shows with absolute accuracy the time of day, the day of the week, the day of the month and the month of the year; it forecasts the weather most dependably, and shows the correct temperature of the air.

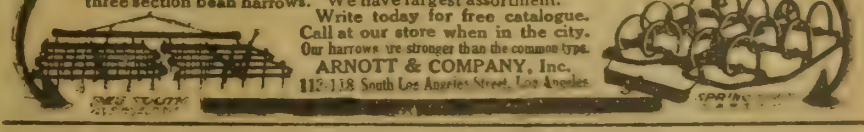
This clock keeps the most accurate time possible, and is never either too fast or too slow.

This very fashionable clack is constructed of walnut wood, and is 25 inches high by 15½ inches wide.

Just consider what a great benefit you will enjoy in possessing such remarkable and modish clock which in addition to the other merits can well be a beautiful ornament to the finest home.

These clocks are sold by others at $18.00 and more; but we send them for only $8.88.

Take advantage then of this rare opportunity and order today this most perfect, most stylish and most practical clock.



In ordering you need not send us the money in advance; it is enough to send only $1.00 as a sign that you wish to purchase a clock, and the rest you will pay when the clock is delivered to your home.

Picked Up in Riverside

Written for California Cultivator by Jean A. Koethen.

RIVERSIDE poultry people are feeling more optimistic than for several years. Demand for chicks has been unusually good, and there is a general feeling that the better days we have been looking for are here. "I've never seen a time," said one man, whom I found preparing to take care of 900 baby chicks, "when so many people were getting into the chicken game. Everybody is feeling very confident of a bright future for the industry."

Wing Clipping for High Fliers

I found Mrs. W. G. Suits of the Bandini Poultry Ranch examining a chick's wing from which the first joint had been removed. This is the third season this plan has been tried on the Bandini ranch. The joint is clipped during the first few days of the chick's life. The chick suffers very little, if any, and hereafter will remain inside a six-foot fence. "One thing is very important, though," said Mrs. Suits. "The chick must be put in a dark place as soon as the operation is performed and kept very warm. If this is not done, you will have all kinds of trouble."

Mrs. Suits, like many others who raise thousands of chicks, is preparing to put in electrical brooders. Since gasoline has been of such inferior quality the big stoves have not worked well. This season Mrs. Suits has raised some of her chicks from special matings in fireless brooders of the Philo type in a room warmed by a coal stove, and the chicks have grown quite as well as in the warmer brooders.

Does Organization Pay?

"Things are looking better," said C. R. Brown, president of the Arlington Poultry Association, "but it's the association that has saved the day. The industry here would not be alive now if the Poultry Producers' association had not kept prices up. There has been some kicking, of course, and some outsiders have gotten higher prices than members of the association, but that was because of the association's work. Three years ago we were selling our eggs for less than it cost us to produce them. If the association had not come in just then and kept prices up I don't know where we'd be.

"Just now we are feeling the effects of the unusually warm winter in the East. This has lowered prices to 38 cents when they ought to be 60. Eastern hens have not stopped laying as they usually do in winter, and consequently there is no market for our eggs in the East.

"San Francisco prices? Yes, they are apparently a little better than ours, but you must remember that Petaluma eggs are sold eight cents under the prices advertised in the poultry journals, while ours are sold for four cents a dozen less than the retail price. This makes the price we receive really a little better than that received by the Petaluma people. The Poultry Producers last year handled 2,433,161 dozen eggs and received for them $1,089,410.

"Perhaps it isn't generally known, but quite a good many Petaluma eggs find their way onto the Los Angeles market. With the East almost closed to us, and our own market not ours exclusively, you can see how important organization is."

This reminds me of a story that was told at a recent religious convention in Los Angeles. A certain gentleman had advertised for a coachman and was waited on by a promising young darkey who assured him he could handle any team. A trial drive was taken, with the darkey on the box, handling the team with one hand and cracking his whip here and there with the other. A bee sitting on a sunflower was flicked off with one snap of the whip. Two bees on another sunflower met the same fate. Then they approached a hornet's nest, hanging from the limb of a tree, with two hornets on guard. "Aren't you going to take them?" asked the gentleman as his driver made no move to crack his whip. "No, sah," was the reply. "I won't meddle wid dem. Dey's organized."

Breeds from the Best

Three years ago C. P. Shaw of Bandini Avenue bought eight White Rock pullets of good stock. One of these proved to be an exceptional layer, and he bred from her to the exclusion of the rest. The first year's breeding brought him 15 pullets, all exceptional layers. The best of these laid 264 eggs in her first year, laying at one time 65 straight days without missing. Another laid 280 eggs in her pullet year but was discarded because of a few dark feathers in her plumage. Ten of these hens, a mother and nine pullets, laid 280 eggs in March a year ago, and 15 of these three-year-old Rocks are now laying 12 eggs a day. The 264-egg hen was mated to one of her sons, and one of her daughters laid 76 days straight in her first year and still lays from eight to 12 days without skipping. Mr. Shaw says he has no use for a hen that does not lay 20 eggs in a month. When I talked with him, the last week in February, his 102 hens, part Rock and part Leghorn, were laying 85 eggs a day.

Mr. Shaw has followed the same method of selection with his Leghorns. He purchased 100 chicks of good stock, and when they were mature bred from the one best hen. His flock, without the use of electricity in the the laying house, is making a better record, he claims, than those of his neighbors who turn on the juice at 4:30 in the morning.

Cattle and lumber interests concerned over the proposed extension of Sequoia national forest recently met in Fresno and passed resolutions asking congress to delay action until opportunity is given to investigate boundaries and interests involved.

POULTRYMAN'S CALENDAR—MARCH, THE BREEDING MONTH

Watch the brooders this month. Have them clean and warm for the arriving incubator chicks, and keep them clean and warm for the growing chicks.

Every brooder that was used last year should be scalded and disinfected before the new hatch goes in. Every brooder, old and new, should be cleaned and disinfected when one brood goes out and another goes in.

Remember, chicks double their weight in three weeks. A brooder that holds 50 newly hatched chicks is too small for 50 a month old.

Warmth and cleanliness are the two great needs of the new hatched chick. It is not necessary to clean out under the hovers the first week. After that they should be cleaned out often and new litter put in.

When chicks lie down they are comfortable. As long as they stand around they are not comfortable. If they peep they are chilly. If they crowd together they are cold.

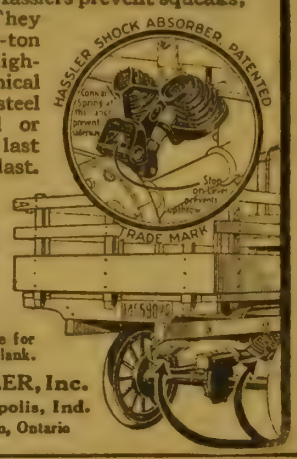
"Pasting up behind" nearly always means that that particular chick has been chilled.

Too much heat after the first week is worse than too little. Overheated chicks are stunted if they grow at all.

Make your Ford Transportation even more Economical.

NEARLY a million Ford owners have found that maintenance and tire costs are reduced approximately 30 per cent and a large saving is made in fuel by the

For FORD Cars — HASSLER — For FORD Trucks



TRADE MARK REGISTERED

Shock Absorber

PATENTED

They protect riders from disagreeable shocks and jolts—make any Ford ride as smoothly and comfortably as a $2,000 car. They make the car safer, preventing sidesway at high speeds. The same shocks that disturb the passengers, also rack, strain and wear out the car. Hasslers prevent squeaks, rattles and deterioration. They make a Ford car or a Ford one-ton truck last longer and give it a higher resale value. The spiral, conical springs of chrome-vanadium steel compress on either upward or downward movements. They last and make the car or truck last.

10-Day Trial Offer

Don't ride without Hasslers because someone tries to discourage you. They are a quality product—worth their price. The Hassler dealer in your vicinity will put them on for 10-days' trial. Your money refunded if you say so. Write for name of dealer and Trial Blank.

EIGHTH NATIONAL EGG LAYING CONTEST

February report for contest at Mountain Grove, Missouri:

Fifty-eight hundred thirteen eggs were laid during February by the 300 pullets, making an average of 18.04 eggs per bird, or an average of 207 17/28 eggs per day. This average is excellent—especially so on account of February being our shortest month.

Following are the leading pens for each variety for February:

S. C. Reds, Missouri, 115 eggs; Buff Orpingtons, Missouri, 115; R. I. Whites, Connecticut, 110; Black Langshans, Missouri, 110; R. C. White Leghorns, Missouri, 108; Buff Wyandottes, Massachusetts, 104; Anconas, Missouri, 104; S. C. White Leghorns, Missouri, 104; White Wyandottes, Missouri, 102; Silver Wyandottes, Missouri, 100; White Rocks, Missouri, 100; Buff Leghorns, Missouri, 98; Barred Rocks, Missouri, 95; Brown Leghorns, Missouri, 93; R. C. Reds, Missouri, 88.

The ten leading pens to date are as follows: R. I. Whites, Missouri, 433 eggs; Buff Orpingtons, Missouri, 416; R. I. Whites, Connecticut, 376; Buff Orpingtons, Missouri, 361; R. C. White Leghorns, Missouri, 359; R. C. White Leghorns, Missouri, 355; Buff Orpingtons, Missouri, 347; White Wyandottes, Missouri, 347; Black Langshans, Missouri, 342; Silver Wyandottes, Missouri, 338.

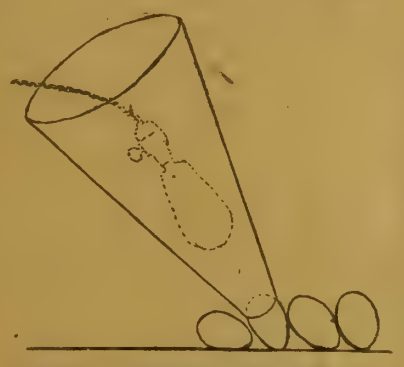
The following hens laid 25 or more eggs during February:

Buff Orpington, Missouri, 27 eggs; R. I. White, Connecticut, 26; White Rock, Missouri, 26; Barred Rock, Missouri, 26; Buff Orpington, Missouri, 26; R. C. Red, Missouri, 25; R. C. Red, Missouri, 25; R. I. White, Connecticut, 25; R. I. White, Missouri, 25; White Rock, Missouri, 25; White Rock, Missouri, 25; Buff Orpington, Missouri, 25; Ancona, Missouri, 25.

FEEDING DUCKLINGS

By Jean A. Koethen

Ducks do best on soft food. After they are grown they may be given a hard grain ration once a day, but while they are growing a moist mash is absolutely essential. The secret of raising ducklings rapidly is to begin with a very simple nursery feed, and then make it richer as fast as the ducklings can stand it. A successful grower of market ducks gives a nursery feed of equal parts rolled oats and cracker or stale bread crumbs, with ten per cent coarse sand. This is fed dry the first two days after the ducklings begin to eat, and moistened with water till it is crumbly four times a day till the end of the first week. After the first week, and until the third, equal parts rolled oats (or oats ground with the hulls sifted out) and bran, with ten per cent corn meal added, five per cent coarse sand and five per cent fine beef scrap, which has been scalded before mixing, are moistened till crumbly, and a little fine cut green stuff added. This is fed four times a day. As the ducklings grow, the proportion of corn meal, beef scrap and greens is increased.



Another successful duck man feeds fine cracker or bread crumbs sprinkled dry on a board covered with sand the first day. From the second to the tenth bran with considerable sand mixed in it is moistened and fed on the board. From the tenth day till the end of the first month an increasing amount of cut greens and corn meal is added till by the end of the month the mash is equal parts corn meal and bran with 15 to 20 per cent green stuff. This man feeds no meat in the ration.

Ducklings should have water for drinking only, and should not be allowed to wet their down until it has turned to feathers.

TESTING INCUBATOR EGGS

Candling or testing out the eggs after five days in the incubator is no small task, and every appliance which simplifies the operation should be availed of. Here is a hint from W. H. Macy of Glenn County which will save much of handling, and best of all is to be had practically without cost:

"To those having electric lights who are running incubators: Take a piece of thin cardboard or very heavy paper,

Homely, Homemade and Effective
Cardboard candler, or tester, for incubator eggs. Suggested by W. H. Macy.

white on one side, and 12x16 inches in size. Roll into a cone, white side in, with opening in small end ⅞ inch in diameter and large end 5 inches in diameter. Insert lighted bulb into this cone and pass over the eggs on the incubator trays, pressing small end of cone over each egg as illustrated below. We hatch several thousand chicks each spring and have found this test the most economical and most satisfactory."

RHODE ISLAND WHITES' NEW OFFICERS

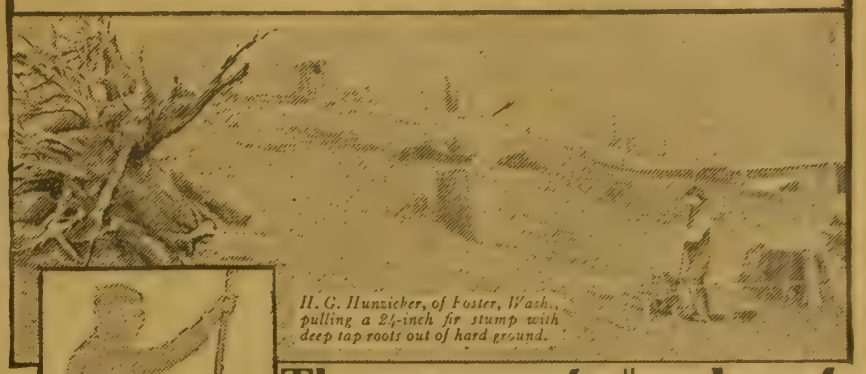
The Rhode Island White Club of America has elected officers for 1919 as follows: President, Harley B. Caldwell, Canutillo, Texas; first vice president, P. W. Harris, Edmond, Washington; second vice president, F. W. Frederick, Cassidy, B. C., Canada; third vice president, F. W. Cumpstone, New London, Connecticut; fourth vice president, Miss Alice L. Anderson, Windham, New Hampshire; fifth vice president, W. R. Swift, Waverly, Illinois; secretary-treasurer, M. E. Bemis, P. O. Box 1376, Phoenix, Arizona; election commissioner, Mrs. C. M. Vertrees, Cecilia, Kentucky; executive committeeman, N. R. Chamberlain, St. Paul, Minnesota.

WHAT PAT HAD BEEN EATING

Pat trotted downtown to a jewler's to buy a ring for his wife-to-be. After waiting until he could obtain the ear of the clerk, Pat whispered, hoarsely:

"Give me the best wedding ring you have in the shop."

"Eighteen karats?" queried the clerk.



"No," snapped Pat, drawing back in an offended manner. "Atin' onions, if it's any of your business."

I do the very best I know how—the very best I can; and I mean to keep doing so until the end. If the end brings me out all right, what is said against me won't amount to anything. If the end brings me out wrong, ten angels swearing that I was right would make no difference.—Lincoln.

Chickens Sick or Not Laying?
Most poor layers are "OUT OF CONDITION" or have Colds, Roup, Bowel trouble, Sore head, Chicken pox, etc. GERMOZONE is the best remedy for all these disorders. At dealers or postpaid 75c, with 5 book Poultry Library. GEO. H. LEE CO., Dept. 418 OMAHA, NEB.

Big Money In Stump Land

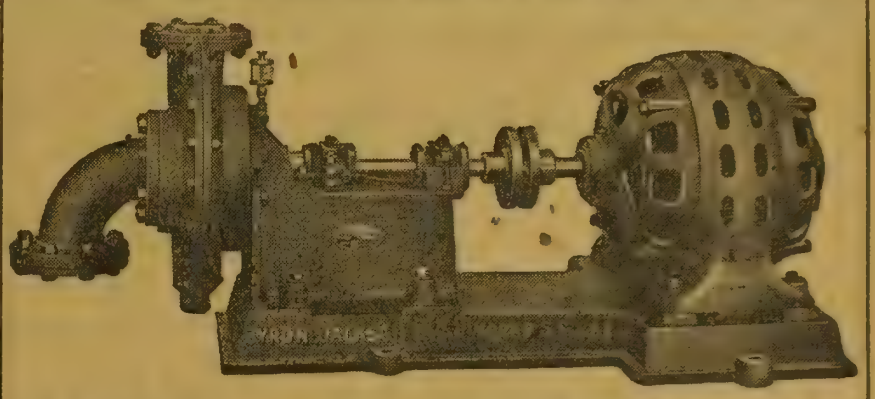
H. G. Hunzicker, of Foster, Wash., pulling a 24-inch fir stump with deep tap roots out of hard ground.

This man made $35 Land Worth $200 an acre Pulling Big stumps by hand

CLEAR your stump land cheaply—no digging, no expense for teams or powder. Your own right arm on the lever of the "K" Stump Puller can rip out any stump that can be pulled with the best inch steel cable. I guarantee it. I refer you to U. S. Government officials. I give highest banking references.

HAND POWER
K Stump Puller

Showing easy lever operation



One man with a "K" can outpull 16 horses. Works by leverage—same principle as a jack. 100 lbs. pull on the lever gives a 48-ton pull on the stump. Made of best steel—guaranteed against breakage. Has two speeds—60 ft. per minute for hauling in cable or for small stumps—slow speed for heavy pulls. Works equally well on hillsides or marshes where horses cannot go.

Write me today for special offer and free booklet on Land Clearing.

Weight, without cable, 171 pounds

Foreign Parcel Post Service

By Grosvenor M. Jones, Assistant Chief Bureau of Foreign and Domestic Commerce

The past four years have seen great changes in the course of foreign commerce, and in many respects the position of American exporters is vastly superior to that before the war. A merchant marine commensurate with our needs has been built up, and foreign banking facilities are rapidly being extended. Trade barriers are being broken down and accurate information on the needs and requirements of foreign markets is being made available to all who are interested. At the same time there are indications that the competition will be more keen than ever, and advantages secured by the temporary absence of competition can be retained only by superior service.

Because of its intimate connection with the promotion of foreign commerce the bureau of foreign and domestic commerce has a special interest in the extension of the international parcel post. American materials will generally find a market without special assistance and it is with the markets for manufactured goods that this bureau is most concerned. The sale of manufactured products is not merely more profitable than the exportation of raw material, but it provides a sounder basis for our economic prosperity.

Opens the Way to Increased Business

It is in the extension of markets for manufactured goods that the parcel post will have its greatest value. The parcel post is, so to speak, a wedge by which foreign markets are entered. Before large orders are placed foreign importers will usually insist on having samples of the goods, or a small trial order will be placed. If the goods are delivered satisfactorily and economically, the way is opened to a profitable business. On the other hand, if the exporter is obliged to decline the initial request because the facilities for making shipment are lacking, his prospects of doing further business have vanished. Rather than decline orders from countries to which no parcel post service is in force, some of the larger houses adopt indirect means of making shipment at greatly increased expense, such as shipping the packages to British ports to be forwarded through the British parcel post.

On account of the difficulties involved this course is not usually open to the smaller exporters, and the first attempts at exporting have often met with so many discouragements that the export trade has been abandoned to the more experienced firms. With a more complete parcel post service foreign markets would be opened to many manufacturers without special export organizations, while the older firms would be able to extend their business greatly. As a direct result of an extension of the parcel post, goods shipped on repeat orders would undoubtedly be exported to many times the value of the introductory parcel post shipments.

The parcel post package is the representative in foreign lands of American industry. It stands in the position of the commercial traveler soliciting orders, and on its efficiency depends the continuation of profitable business.

It is unnecessary to mention that the principal European countries have service to almost every corner of the earth. A mere enumeration of the countries reached by the British parcel post, but to which there is no service from this country, shows at once the great advantage with which British firms enter the field. Right at our very doors are Canada and Cuba with which we have no regular parcel post conventions, and other countries with which we have parcel post arrangements and which offer excellent prospects for increased business include Spain, Switzerland, British India, Egypt, the Union of South Africa, Algeria, Morocco, and a large number of smaller countries. To each of these the British exporter can send his personal representative direct in the form of a parcel post package, but American exporters can not.

The commercial importance or unimportance of a country is not the true standard for measuring the need of parcel post service. There are few countries in Europe the commercial relations with which would be as seriously disturbed by the termination of parcel post service as actually occurred when the convention with Chile was abrogated in 1917. Moreover countries now receiving only moderate quantities of American goods may become important markets when the parcel post becomes available. Reference is made to Egypt, India, Morocco, and the colonial possessions in Africa.

From the many letters concerning foreign parcel post service received in the bureau of foreign and domestic commerce it is evident that many people fail to realize what has already been done to make the parcel post service an efficient means of commerce. During the course of the war the extension of the service was naturally limited, but negotiations have been resumed, and at least one new country—Siam—has been opened up to our trade since the signing of the armistice. Even during the war several marked improvements were made particularly in the extension of the limit of weight to 20 pounds for four Latin American countries. It is understood that, where possible, new conventions will be made on the same basis.

BARLEY FULL OF WEEVILS

The following item from the Madera Mercury indicates a danger to large quantities of poisoned barley held over winter. When county horticultural commissioners adopt the policy of mixing their own poisoned grain as needed, having it always fresh and bright, the general efficiency of the poisoned barley method will be increased.

"The poisoned barley at the court house, which was purchased some time ago for poisoning squirrels and of which there is several tons still remaining in the court house basement, has been attacked by an army of little black weevils. The poison has no effect upon the bugs and they lead an army against every barrel. The barley was threatened with immediate destruction and the county would lose several hundred dollars unless something was done. Horticultural Commissioner George Marchbank summoned his forces Saturday afternoon, consisting of Major D. F. Edwards, a bottle of carbon disulphide and a few wasteballs. Every barrel of barley was opened and a wasteball saturated with the disulphide was placed inside. The victory was grand and glorious. It not only drove the bugs out, but it also drove everybody else out of the court house basement and even today those compelled to go there on business remained no longer than necessary. The floor is literally covered with dead bugs, and those that escaped are dying from overwork trying to crawl up the basement walls."

Incidentally, it might be mentioned that Commissioner Roullard also successfully treated seven tons of poisoned barley for weevils.

Household Department

WHERE THE SMILE-FLOWERS GROW

) I wish I knew where the Smile-flowers grew
And the time of the year they bloom;
should go and gather a load or two—
(Or as much as I had room)
nd I'd scatter smiles the whole day long
Through sunny days and through rain
would smile and smile till the flow'rs were gone
Then I'd go and get more again.

f I ony knew where the Smile-flowers grew
I'd gather them fresh each day,
nd where'er I'd go I should take them, too
And leave a Smile-bouquet.
nd the clouds would reflect the flow'rs I had
Till a rainbow was formed of tears,
or all whom I met would smile and be glad
And forget the sorrowful years.

f I really knew where the Smile-flowers grew
I'd just take my friends along
nd we'd go in the morning while yet the dew
The Smile-flowers glistened on,
nd we'd take our lunches and stay all day
And all through the fields we'd roam,
nd when it was growing too dark to stay
We'd carry the flowers home.

nd then to the sick shut in alone
With their burdens so hard to bear
Ve'd carry the smile we had brought back home
And leave a large number there.
nd then to the sad who were tired of life
We'd carry some smiles and go,
ill they, too, smiled and forgot earth's strife
And the Smile-flow'rs scattered their woe.

ut they say the only place Smile-flowers grow
Is down in a gunshiny heart;
nd I half believe that it must be so,
And I've a good mind to start
Smile-flower garden all my own
And cultivate smiles each day,
nd I'd gather the flowers, then, right at home
And never need go away.

—Herbert Buffum.

THE BUTTERWORTH BAYS

WITH an odd little jolt, suggestive of cramped muscles, Uncle Billy Edwards raised himself from his bent position over the old farm grindstone, and ran a critical eye along the scythe he had been grinding. He ested the "feather edge" of the implement, and nodded approvingly.

Then his keen old eyes wandered across the creek below, and out to he far side of the little valley, where, n the upper part of the wide Butterworth meadow, a big bay team, atached to a sulky plough, was workng steadily. The big team handled he rather heavy plough with dignified ease.

"Good team Joe's got there—crackn' good team, I call 'em!" he muttered. "But I'm afraid they cost him pretty penny. I'm afraid,"—his harp old eyes came slowly back over he great blossoming meadow to the arm buildings below,—"I'm afraid here's something wrong with Joe—Joe and Dorothy. Here 'tis now, time o begin haying, and Joe just ploughng for buckwheat. Ought to have had the crop in, and out of the way, wo or three weeks ago. Used to be n time,—if anything, a little ahead, —Joe did. And those doors, now, at he big floor of the barn, hanging crisscross like that, with twisted track and sagging braces, just for the lack of a few spikes and an hour or two of work."

The old farmer carefully replaced he sheltering "hood" over the grindstone. His eyes returned to the farm buildings below. "And the yard round the house begins to look cluttery. Dorothy used to keep it as neat as could be. And the poultry yard—I don't believe there's more than a dozen odd scrub hens in it; and—"

"Good afternoon, Uncle Billy!"

The old farmer turned quickly, and at sight of a trim, alert girl in a neat-fitting muslin gown and jaunty hat, a quick smile of welcome lighted up his face. "Why, how-d'ye-do, Dorothy? How are ye, child? Come on up to the house. Your Aunt Mary'll be glad to see you. Come right along."

Dorothy Butterworth's black eyes softened at the warm greeting; but she shook her head.

"I can't stop—not today, Uncle Billy. It's our Saturday Afternoon Club over at Benton, you know, and I'm secretary. I'm taking the third rail today instead of driving. You see, I shan't have time to stop."

Uncle Billy's face fell. "Oh—yes, I see," he said slowly. "But I thought your club meeting was yesterday, Dorothy."

"I said Saturday Club, Uncle Billy. Yesterday was the D. A. R. meeting."

"Oh, yes, that's so. But you haven't been over in a long time. Couldn't you come the first of the week? Monday afternoon, say?"

"We have our Monday Study Club then; and, really, I don't know when I could get away. I've promised to help the Christian Endeavorers with their entertainment; and then there's a library meeting, and—"

"Don't you get tired of—of being away so much, Dorothy?"

Uncle Billy had turned uneasily, and was again looking toward the big meadow. Two bright spots flamed suddenly in the young woman's face, and her black eyes snapped. "I should be tired enough if I didn't get away pretty often—if that's what you mean, Uncle Billy. I like to feel that someone cares for what I do occasionally."

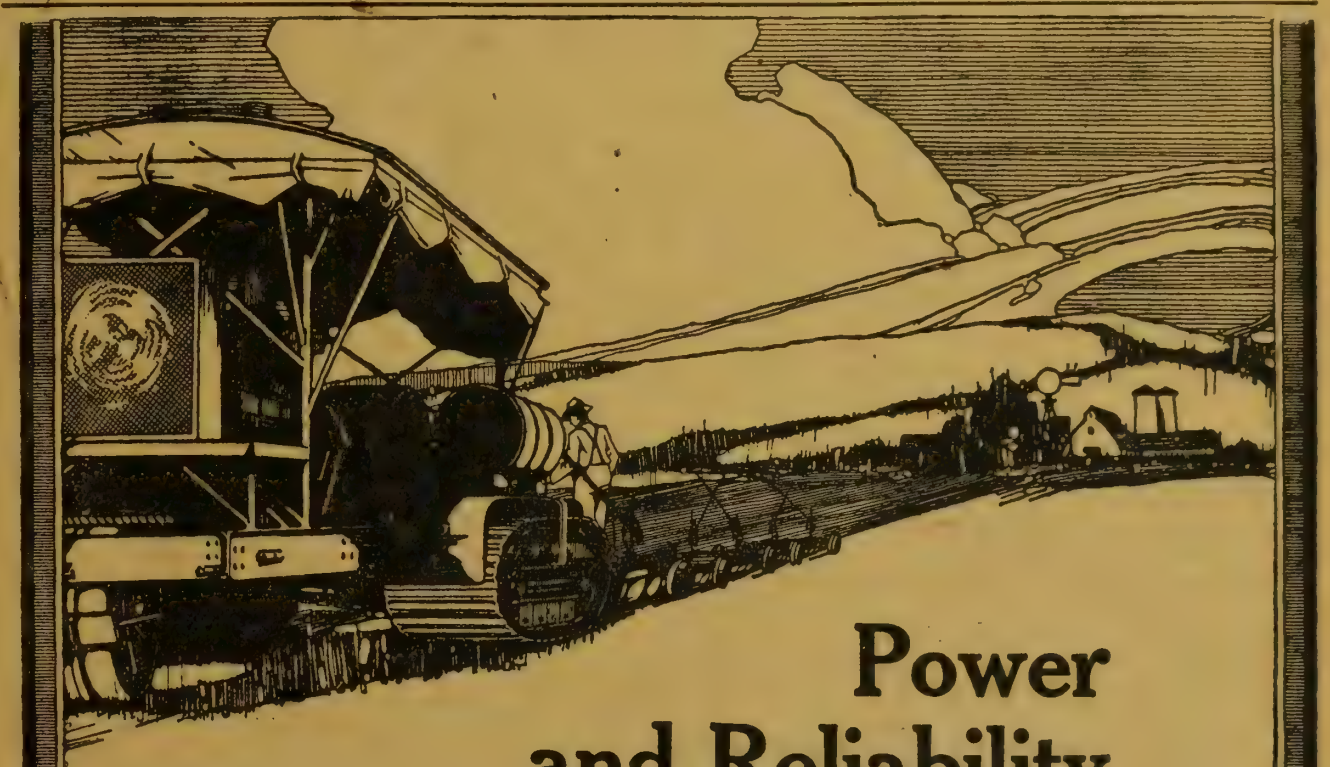
For a moment the old farmer fumbled awkwardly with his hat; then he said, "I've—I've been afraid there was something—something between you and Joe. It seems as if neither of you took much interest in the home place any more. I don't want to meddle,—you know that, Dorothy,—but I wish—I wish I could—"

The girl shook her head. "You can't, Uncle Billy. You can't help a bit." She spoke with a kind of hopeless firmness. "If I thought Joe cared—really cared for me, as he used to care—it would be different. He doesn't. You think I'm away from home too much, I know. Well, I am away—but Joe's away until late every night, and a good share of the days. I don't know where he goes or what he does—and I don't care."

She lifted her round chin proudly, but her voice trembled a little.

"Joe cares more than you think, maybe," said the old man. "He—"

"Uncle Billy, I'll tell you what Joe Butterworth cares for. He cares for a few cronies of his over at the Corners; he cares for the thoroughbred stock he's starting to raise; but more than anything else in all this wide world, he cares for that big new team of his,—the bays,—Ned and Dandy Jim yonder." She pointed toward the distant field where the horses were ploughing.



"They are a fine team, Dorothy, but—"

"Of course they're a fine team, but it's a little hard for me, Uncle Billy, he cares more for that team—anyone can see it—than he does for me, his wife, a thousand times more. He—he cares—" She stopped suddenly, with her face aflame. "Uncle Billy, what have I said! I'm ashamed to have spoken like this. I've never said a word before. You—you'll understand, won't you? I—I must go now." She turned, yet not so quickly that the old man did not see the tears that trembled underneath her long lashes.

The crossroad that led to the little, uncovered platform of the electric railway nearly touched the far upper end of the big Butterworth meadow where the late ploughing was going forward. Joe Butterworth could hardly fail to see the alert, neatly dressed young woman who passed quickly by. But there was no sign, even the slightest, from either man or woman that they saw each other. With a set, hard look on his face, the young farmer turned at the end of a furrow, spoke to the big team in his usual quiet tones, and ploughed on steadily.

The hard look had deepened perceptibly on Joe's face within the past year. Just how the gulf had begun to widen between himself and the girl he had married five years before, he hardly understood.

All the afternoon he ploughed steadily; the long, straight furrows fell exact and true, for he could do good work when he chose, and the big bays did their part faithfully. A flash of

Power and Reliability

Power and reliability, coupled with right design, are essential requirements of the successful tractor.

Power sufficient for the heaviest work—the "peak loads" of farming, freighting or road work. Reliability that insures the work being done on time, whenever and wherever the demand comes, and regardless of the conditions. These features the "Caterpillar" Tractor has been showing for many years—providing ample, economical power and giving consistent, reliable service in every kind and condition of work. But most important to consider is the design of the tractor in which these qualities are contained. Holt design—imitated but unequaled—makes the "Caterpillar" Tractor easily the foremost tractor of the world today.

"Caterpillar" Tractor superiority is an established fact—established by the service this tractor has given its thousands of owners—established by the rigid Government tests resulting in extensive purchases of "Caterpillar" Tractors for war service—established by the performance of those tractors in the Great War.

Let us tell you more about the "Caterpillar" Tractor—how it can be put to profitable use for you—how its record in peace and war makes it your logical choice. Send for catalog No. 394.

the old pride lighted up his face occasionally, as he watched the steady, even work of the great team.

Late in the afternoon a summer shower came up unexpectedly, and swept down over the big south hill—a torrent of rain, accompanied by a fierce, twisting wind that made the wide-armed maples bend perilously.

From the shelter of the old hay barn in the upper part of the meadow, Joe looked out at the brief shower. In the pouring rain the valley below, with its cluster of home buildings, seemed only more desolate and uninviting than before. The flock of mongrel hens caught suddenly in the storm rushed for shelter. He smiled a little grimly when one of the sagging barn doors, wrenched from its insecure fastenings, was flung across the barnyard.

"Don't know as it makes much difference!" he muttered. "There's no one there to see."

He went round in front of the waiting team, in order to lift the great collars and adjust the heavy manes. Instantly their small, alert ears came forward in friendly greeting, and both soft, sensitive noses began a prompt investigation for sweets. Joe Butterworth's face lighted up quickly.

"There, there, quit that, you Dandy Jim! Stop your fooling, Ned, you rogue!"

He slapped the smooth necks affectionately. "You know well enough you don't get sugar till night. A few times more across and we'll quit and call the ploughing finished."

The storm was about over, and backing the team out carefully, he resumed his interrupted ploughing.

The return furrow was little more than half completed, however, when the big bays halted suddenly, and with their ears thrust forward, stared at a grotesque little figure that came stumbling across the furrows in frantic haste.

"Look out there, you Billy Mead!" Joe Butterworth called sharply, as the child stumbled and fell almost beneath the feet of the horses. Then he saw the boy's white, scared face. "Why, what is it, Billy?"

"O Joe!" The boy was breathing hard. "Ma—ma she said to run fast and tell you. There's been an accident at the flag station. They telephoned to ma—and—and ma said to run fast—and—O Joe, you hurt awful!"

But the young farmer's grip on the child's arm tightened. "Tell me, Billy, now!"

"They were at the station, Joe—just off the car when the storm caught and drenched them, Mrs. Butterworth, and some woman come to visit up to Steve Gray's,—and it blew them onto the track.—and Mrs. Butterworth fell down—and—and got against the third rail, and she's—she's dead!"

For some minutes Joe Butterworth stood quite still in the furrow, staring about him. The big team waited patiently. The boy, rubbing his arm where the man's strong fingers had gripped it, edged away slowly, and then ran back across the furrows toward home. Suddenly Butterworth turned, and with set, white face, walked swiftly across the field toward the crossroad that led to the little station. A sharply defined vision seemed to unfold itself before his eyes, a vision of himself and the bright-eyed girl he had married, and of their life together. Curiously enough, he saw, not the last unhappy years, but only the first beautiful ones, when the girl had bravely placed her hand in his and had started with him to build a home.

Then presently, like an ugly knife thrust, came the memory of the last unhappy months—to end like this!

He vaulted the fence and stood in the narrow crossroad.

"Joe! O Joe!"

(Continued next week.)

FROSTED ORANGES MAKE GOOD MARMALADE

The Los Angeles County Farm Bureau Monthly tells how to make good orange marmalade from frosted fruit; also candied orange peel.

Orange Marmalade

Wash, wipe and slice thin 5 oranges and 3 lemons; weigh. To each pound of the fruit allow 1½ quarts of cold water. Set aside for 24 hours, then bring rapidly to the boiling point. Boil violently 45 minutes. Set aside for

The Cultivator Patterns

8911—Girls' One Piece Dress. Cut in sizes 4, 6, 8 and 10 years. The sleeves may be long or short.

8915—Ladies' Waist. Cut in sizes 36, 38, 40 and 42 inches bust measure. A tiny lace-trimmed shield fills in above the low crossing of the fichu.

8898—Ladies' Shirtwaist. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The fronts of the waist are gathered at the shoulders.

8891—Ladies' House Dress. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The simple waist is in shirtwaist style; the skirt is three-gored.

8917—Ladies' Dress. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. This dress combines plain and plaid material to good advantage.

8639—Girls' Dress. Cut in sizes 4, 6, 8 and 10 years. This dress slips on over the head, and the guimpe buttons at the front.

8910—Misses' or Small Women's Three or Four Gored Skirt. Cut in sizes 14, 16, 18 and and 20 years. The front gore is fitted and the back is gathered at the slightly raised waistline.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT
CALIFORNIA CULTIVATOR
Los Angeles.

another 24 hours, then weigh again; bring to the boiling point. To each pound of fruit with the juice, allow ¾ pound sugar, and juice of two lemons. More lemon juice may be added if desired. Boil 45 minutes, timing from the moment the marmalade begins to boil. Place in glasses.

A clear jelly may be made from the strained juice.

This marmalade made from frosted oranges is cloudy in appearance, but good to the taste. Recipe makes about 16 glasses; beet sugar was used. If a thermometer is used for testing, it should register 220 degrees F.

Candied Orange Peel

Wash and wipe the oranges, remove the peel, cut it into ¼ inch sections lengthwise with a pair of scissors. Cover the rind with cold water. To each pint of water allow 1 level tablespoon salt. Bring slowly to the boiling point; boil 15 minutes; drain off water. Repeat the process four times, omitting the salt. During the final boiling, cover the kettle and boil 20 minutes. Drain thoroughly. Place in a shallow graniteware pan; cover with a heavy sirup made by boiling 2 cups of sugar with ½ cup water together for 10 minutes. Gently cook the rind in the sirup until clear; then remove from the sirup; drain well. Roll in coarse, crystal sugar, pack in shallow air-tight tins or jars. The rind may be placed in jars with the hot sirup. Sterilize for 10 minutes, tighten covers. Keep as you would canned fruit. Reheat, drain off the sirup and roll in sugar. Fine to use in fruit cake or steamed pudding.

The orange rind may be cut into halves or quarters, crystalized and dried. Geep in covered jars.

FIX IT YOURSELF

Written for California Cultivator
By Elinor Rives

So many women seem to think that when their electric iron goes "whish" with a flash of fire and a puff of smoke, and then refuses to heat up again, they must postpone their ironing till the "handy man" gets home; or they can secure the services of an electrician. Ten minutes is plenty of time to fix it yourself. Take out the screw which holds the plug together, then slowly take it apart, noticing carefully how the parts are assembled. Cut off the frazzled ends, pull the insulation back an inch or two, and put together.

When the kitchen faucet drips, don't wait for the plumber while your water bill runs ever higher; fix it yourself. Don't take the top out of the faucet, unscrew it from the wall. You will see a worn, pear shaped washer fastened by a cap and nut. It is no trick at all to replace the washer with a new one and screw the faucet back into the wall.

The ladies forgot to mention that besides using flour sacks to make B. V. D.'s for the family, towels, napkins, handkerchiefs, etc., they make very pretty sash curtains, also curtains for that (usually) unsightly place under the sink. They may be dyed or stenciled, while the sugar sacks may be hemstitched readily and look like scrim. I have made every-day tablecloths by putting two or four together with cat-stitching.

Only a fool has to go broke to learn that it's easy to drive a car down hill.—Binghampton Press.

A Piano House
Which Serves When It Sells

When you come to Sherman, Clay & Co. we prefer to consider your requirements first, for there are all grades of Pianos, and what would be the proper instrument for the Living Room may not be the best for the children's piano lessons. Take us into your confidence and we know we can fill your every requirement as to price, terms, style, tone, etc. We will serve you to our best ability and the transaction will be mutually satisfactory.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, Player Music, etc.

Cushman Engines
For Pumping

Why purchase an engine for pumping only. CUSHMAN engines run smoothly, steadily, almost noiselessly. They use gasoline or distillate, with guaranteed economy. High speed, with throttle governor and perfect balance, gives smooth, continuous flow of power and insures uniform speed, so that the pump or machines gives out its fullest capacity.

Built Light ——— Built Right

So that explains why they are more durable than the common types weighing four or five times as much. There are no violent, irregular explosions nor the ever-changing speeds of the heavy hit-and-miss types.

Only All-Purpose Farm Engines

When the pumping is over use your engine for other work. Being light, compact and with wide range of speed, it is easily and quickly adapted to any work. All sizes furnished with friction clutch pulley, Schebler carburetor, throttling governor, forced water circulation, battery or magneto ignition.

Dipping Wheat Seed

NORMAN F. D'EVELYN writes regarding experiments which have been made during the present season in testing germinating power of wheat which has been dipped. The experiments have been performed by the Sperry Flour Company and give warning that extreme care must be used in dipping wheat which is to be planted on heavy soil. It will be well to keep these suggestions in mind next seeding season. Mr. d'Evelyn writes:

That germination of wheat which is to be planted in cold weather is partly destroyed or seriously retarded by dipping in a smut preventing solution is the conclusion convincingly proved out by some experiments just completed by the agricultural department of the Sperry Flour Company at Stockton. The company has been and remains thoroughly an advocate of the wisdom of treating seed wheat and its own experience has been that under favorable climatic conditions careful dipping does not at all interfere with germination.

The germination tests were begun early in February, following the long sustained cold spell. Some cold, unfertilized, heavy adobe soil was secured and divided into boxes so that the experiments might be carried on under the nearest approach to field conditions. Five varieties of wheat, Australian, Early Baart, Club, Sperry No. 1 (Bunyip), and Sonora, were selected for the test. To carry through the parallel of the conditions confronting the farmer, miniature burlap sacks were made and dipped in solutions prepared in the laboratory according to the recognized formulas. For the bluestone-lime solution the University of California's formula was followed: The wheat was dipped for three or four minues in a solution made by dissolving bluestone in water in the ratio of one pound to four gallons, following which the drained sacks were dipped for three minutes in air-slacked lime in the proportion of one pound to eight gallons of water. For the formaldehyde the standard 40 per cent strength was used in the proportion of one pint to 45 gallons of water, the wheat being immersed in the solution for from eight to ten minutes.

The following day the wheat from the little sacks treated by the two different methods together with untreated wheat of the same varieties was planted, after a uniform number of kernels had been carefully counted out.

At the end of five days one set of plots was unearthed and the condition of the kernels carefully observed and tabulated. Every second day thereafter kernels from another set of plots were similarly unearthed and the results recorded. The following table shows precisely the percentage of germination for each type of wheat, handled in the three distinct ways, in the ground for the length of time indicated:

Effect of Dipping on Germination of Wheat

Soil — heavy adobe, unfertilized, shaded.

Bluestone — University of California's formula.

Formaldehyde—one pint of 40 per cent solution to 45 gallons of water.

Dipped—February 5, 1919, planted February 6, 1919.

Plots unearthed at two-day intervals as follows, beginning February 11:

Percentage of Germination

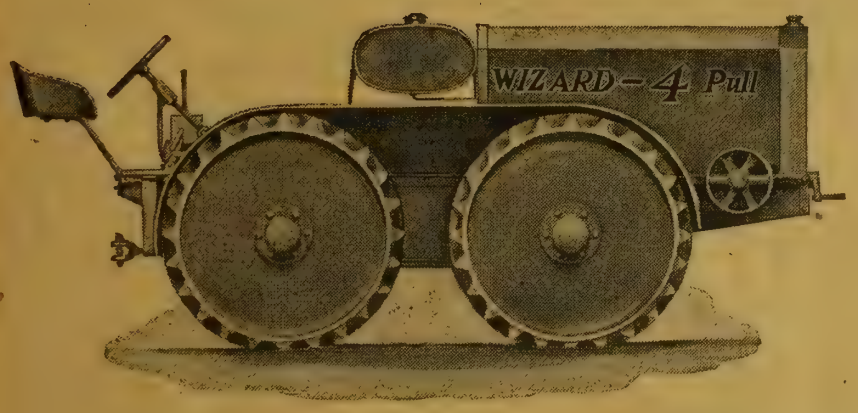
	Not Treated.	Bluestone Lime.	Formaldehyde.
Australia—5 days:			
Strong	98	2	72
Weak	2	26	12
Not visible	..	72	16
Early Baart—7 days:			
Strong	74	38	80
Weak	10	22	7
Not visible	16	40	13
Club—9 days:			
Strong	92.05	4.7	83
Weak	5	60	13
Not visible	2.5	35.3	4
Bunyip—11 days:			
Strong	96	6	55
Weak	4	50	24
Not visible	..	44	21
Sonora—12 days			
Strong	65	3	57
Weak	25	74	40
Not visible	10	18	3
Average for the 5:			
Strong	85	12	69
Weak	9	46	19
Not visible	6	42	12

These experiments were conducted under the direction of George R. McLeod, head of the agricultural department of the Sperry Flour Company, who has made a broad study of wheat growing practices. His theory is that a weaker solution of bluestone or formaldehyde than the usual formulas call for should be used after the cold weather has set in. He reasons that if the solution weakens germination it will also tend to weaken and destroy the smut under similar conditions.

Finally, while his belief in the value of treating wheat for the control of smut is unshaken, he is impressed with the conviction that it is of the utmost importance that as the weather grows colder the strength of the dipping solution should be gradually weakened and that extreme care should be used in the treating not to permit the wheat to remain in the solution too long.

In publishing the results of the test the big milling company's agricultural department is most solicitous that the grain growers should not by any chance become thereby prejudiced against dipping wheat. Properly handled, the smut control treatment has no appreciable effect on germination. For instance, on the Sperry Experimental Farm No. 1, about 15 miles east of Stockton, seeding was begun in the latter part of October at the rate of 74 pounds to the acre, after the wheat had been dipped in a formaldehyde solution. The seed was planted at the depth of about two inches. The weather was warm and the moisture was within three inches of the surface. The day after seeding was finished about an inch of warm rain fell, soaking through the dry, top layers of soil. As a result the stand indicated practically 100 per cent germination and was fully as thick as had often been secured by planting 100 pounds of wheat to the acre. The following week, after the weather had grown somewhat colder, wheat treated with formaledhyde and sowed about 30 pounds heavier to the acre than the first planting did not germinate as quickly or as strongly as the small field adjoining planted at the same time with the untreated wheat.

A little later on in extremely cold weather a small field was planted to wheat that had been dipped in a solution of one pound of bluestone to eight gallons of water (half the strength called for by the formula) and although put in at the rate of 100 pounds to the acre only about 10 per cent of the wheat germinated. Frosty weather continued after planting. Thirty days later, after it became evident that the wheat was not coming up, this ground was reseeded with untreated wheat and in spite of the fact that the weather was still frosty, nearly a 100 per cent stand resulted.



Incidentally it was observed that in putting in wheat in extremely cold weather harrowing should not be begun until the frost had had an opportunity to thaw out.

ANNOUNCING THE

WIZARD

(Trade Mark Registered in U.S A, and all principal foreign countries)

4-PULL TRACTOR

Patented and other patents appplied for in all principal countries in the world

KROYER WIZARD

It is a Track-Shun Make-Good-Tractor

A COMPLETE LINE

To be built in sizes

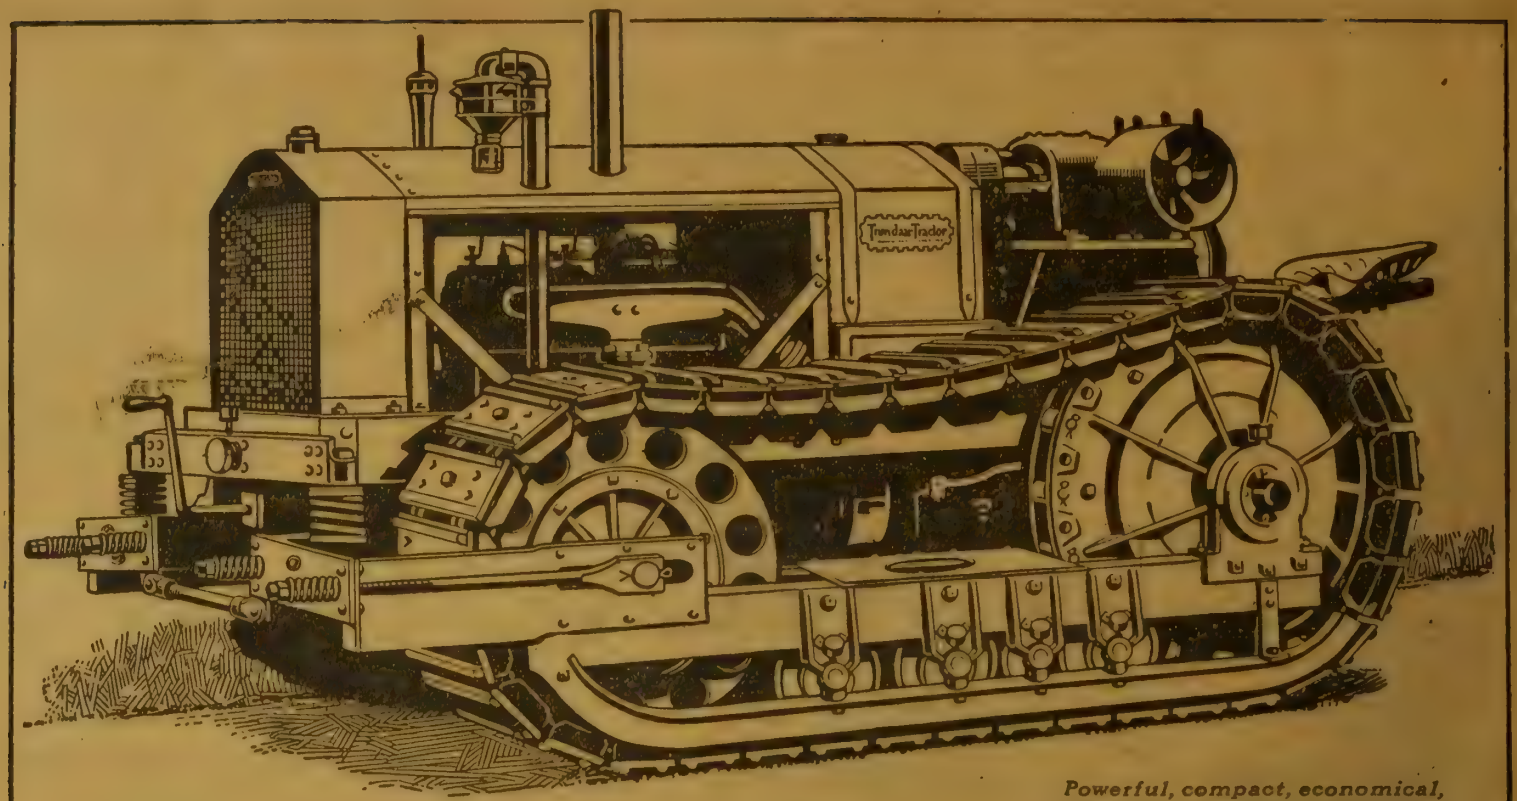
6-10 12-20 20-35 30-50 45-75

THE KROYER WIZARD 4-PULL TRACTOR is built low yet has spacious clearance under the body, between its wheels. It is short in over-all length, powerful in performance, and develops unusually high efficiency in draw-bar pull. It is equipped throughout with ball and roller bearings.

With our experimental *Wizard 4-Pull Tractor,* we have plowed and cultivated the loosest blow-sand land and immediately after plowing same, have gone over it again, pulling a full load without slipping the wheels or having the Tractor bury itself. Work of such nature that would in a short time wear out tracks or moving parts on other tractors, has no effect on the *Wizard,* all its working parts being enclosed in oil-tight housings.

It will work and get traction after rains, snow or irrigating, as soon as horses could be successfully used on the same land. It will operate on peat land and in many sections where soil, difficult to work, is now lying virgin for want of a practical means by which to till it.

The much desired feature of short turning has been mastered in the Kroyer Wizard by a device unique in its construction. This is one of its patented features, causing it to turn itself around in a pivotal manner, when so desired, without making any backward or forward movement (as when a man turns himself on his heel) and this can be done in either direction.



It is quick and very flexible in action and operated with ease, making the handling of the *Wizard 4-Pull,* light work. The weight is distributed equally on all four wheels when pulling a load, and it does not pack the soil.

Mr. Kroyer, being a pioneer tractor builder, knows, however, that no new principle embodied in a tractor, makes, in itself, a perfect machine. Experience must be built into it throughout, from the point where it touches the ground to the top of its hood. In other words, a master mind in tractor construction must be the foundation for producing a tractor that is actually successful. This ability Mr. Kroyer possesses, being a practical man and having designed, built and marketed seven different models of Tractors since 1903. As early as 1904 he built in his second model (size 8-16) an enclosed dust-proof machine, and in his fifth model (size 15-30) built in 1913, he used the live rear axle principle in an all enclosed dust-proof tractor. Over 3000 of Mr. Kroyer's Tractors are in use on the Pacific Coast and in other countries, and they are regarded as the most durable tractors in the field.

The *Wizard 4-Pull* will be a "quality" machine and built to give at least ten years' service when used with reasonable judgment. It will be distributed and sold conscientiously. Orders are held for 1200 of the 12-20 *Wizards* for California, with strong demand for the other sizes, and deliveries are expected to begin this fall.

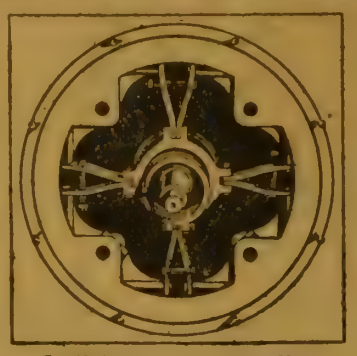
The *Wizard 4-Pull Tractors* will be manufactured by the Kroyer Manufacturing Co., a $5,000,000.00 corporation, with its plant located at Stockton, California, an additional eastern factory being also contemplated.

Stockton, California

Powerful, compact, economical, dependable. The Trundaar Tractor puts through every farm job on schedule time

A year's profit saved in one day

WHEN the loss of a day may mean the loss of a harvest, you appreciate most keenly the need of a tractor that will never fail you. When help is short and time is pressing, a tractor that will give service, day after day without fail, will bring big returns on your investment. When the Trundaar Tractor was designed, the point the engineers kept most clearly in mind was that this tractor must always be ready for use when needed.



Why this tractor is so dependable

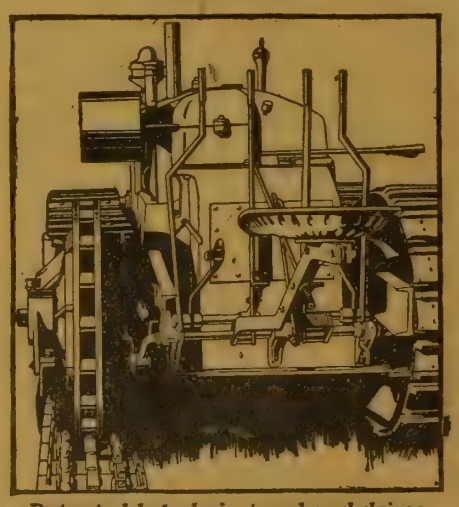
The design of the tread is one reason why the Trundaar is uniformly dependable. This tread, of the endless chain type, is built on the old log-chain principle. The connecting links are short, thus reducing the play and minimizing wear. Absolutely no lubrication is required. On treads where lubrication is necessary, the mixture of dust and oil works into the parts and grinds them away much as emery would. If a link on the Trundaar Tread does get broken, no time is lost. The links and grouser plates are attached by four bolts and can be removed and replaced in fifteen minutes.

Big, powerful engine

The engine in the Trundaar is as dependable as the tread. The Special Buckeye Tractor Engine supplies an excess of power for all field and stationary work. It is built expressly to stand the rough going and constant running to which a tractor engine is subjected. It is rated at 20 horsepower on the drawbar and 35 horsepower on the belt. Grant Miles, of Fairfield, Washington, writes:

"During my spring plowing I pulled seven 14-inch plows 5 inches deep on level land, and on the hilly part of my farm I pulled five 14-inch plows 5 inches deep."

Individual multiple disc drive clutch



All vital parts of the Trundaar run in oil and are absolutely protected against dust. Even the air intake of the carburetor is fitted with a clarifier which prevents the dust from getting into the cylinders.

Each tread is controlled by a powerful multiple disc clutch running in oil. This special feature eliminates the need of gear and pinion drive which is frequently a cause of interrupted service.

The massive Trundaar transmission, the powerful driving clutches and the double three point suspension all are planned to make the Trundaar the dependable tractor.

If you are operating a farm of 200 acres or more you should know about the Trundaar. Write today for information showing what this tractor is doing under conditions similar to yours.

Overland
TRADE MARK REG.

For Him

The confidence purchasers have in the performance of the Overland Motor Car is the direct result of the pride of Overland owners. For ten years public appreciation has been our sole aim and guide. The Overland Motor Car today reflects the best of our great engineering experience and production facilities The car's reputation grows steadily as owners tell their friends of their satisfaction in driving it. Thus the friends of owners form an ever larger proportion of our customers The constantly increasing sales of the Model 90 shown here now number more than one hundred and fifteen thousand cars.

Which is Biggest---Pear or Overhead?

By C. B. Messenger

THE overhead takes half of the average crop. Bear in mind, I say 'average crop', and if the fruit is wormy and unsaleable, the overhead still remains the same."

These remarks were made by V. T. McCurdy, grower and packer of McCurdy brand Santa Clara Valley pears, to me as I stood looking at a load of fruit on the trees. Appreciation of the size of the load is only faintly given by the photographs of props and fruit on this page. The remark was made in justification of the number of sprayings which Mr. McCurdy had given to this orchard last year. He had said: "I spray in January when the trees are perfectly dormant, with oil emulsion. I spray again just as the buds are beginning to swell, lime-sulphur nine to one. I spray again (now come the hints which are of value at this particular moment) with lime and bluestone as the blossom buds are appearing. I spray again two or three or several times, this year six times, with an arsenate spray, to prevent wormy pears."

"But such a number of sprayings is very expensive. Does it pay, Mr. McCurdy?"

"Well, it makes me spend thousands of dollars for props to hold up the fruit, but the best answer to your question is the fruit on these trees."

And such loads we never saw, and all of it fine fruit, and not a worm, not a scab.

But again, does it pay? Mr. McCurdy came to Santa Clara Valley with but little more than good health and a determination to work and with a further determination that the work should be so intelligently directed that it would result in success. His experience or knowledge of the pear industry was practically nil, but there was a state university near by and a county horticultural commissioner at a moment's call, and these two forces were appealed to to direct him as to best steps to take to raise pears which people would demand and be willing to pay for.

The county horticultural commissioner, L. R. Cody, informed me that while he often had occasion to call upon Mr. McCurdy for helpful suggestions as to pear culture, yet McCurdy was also appealing at every opportunity for the best and latest information as to sprays or other essentials of successful production.

Notwithstanding Mr. McCurdy's principal asset when coming to the Santa Clara Valley was determination and good health, he now has a pear orchard that is almost a principality, packs his own fruit and ships in car lots under the McCurdy brand and has a reputation that is worth an independence. His reputation has come from honest pack of honest goods.

Note we say above, "not a worm, not a scab." And this we mean literally, for when the question was asked as to percentage of clean fruit secured through the method of spraying followed, Mr. McCurdy simply replied: "One hundred per cent." "Not a single worm in the orchard?" "Not one", and search failed to give opportunity to challenge Mr. McCurdy's statement.

These Props Are Profitable

In the orchard of V. T. McCurdy, San Jose, soil fertility and sufficient spraying to secure clean insect free fruit give big crops of perfect fruit. Mr. McCurdy and County Commissioner Cody are inspecting the fruit

Not a Lumber Yard but a Pear Orchard

A Santa Clara Valley pear orchard which is yielding immense crops of worm free fruit, which is commanding long prices.

The Sprayings

1. Plow under dead leaves to prevent spread of scab spores.

2. When trees are perfectly dormant, spray with strong oil emulsion, this in January.

3. Lime-sulphur, 9-1, as buds are swelling. This spraying very thorough, reaching tips of every twig.

4. Bordeaux as buds are just beginning to open.

5. Bordeaux and arsenate when blossoms are well out. The strength of the Bordeaux, as recommended by the university and used by Mr. McCurdy, is as follows: Bluestone, 20 pounds; quicklime, 25 pounds; water, 200 gallons.

Dissolve the bluestone and slake the lime in separate vessels. Strain the bluestone into the spray tank and fill it half full or more with water. Strain in the lime mixed with the rest of the water. Always have the materials well diluted before mixing them together. (Note.—If a third spraying, of lead arsenate combined with Bordeaux mixture, be made, the amounts of bluestone and lime may be reduced to 15 and 20 pounds, respectively.)

If arsenate is added use at about the rate of two pounds to 50 gallons of the mixture.

6, (and as needed thereafter). Spray with arsenate, 2½ pounds to 50 gallons water.

But once more, "Does it pay?"

One little corner of Mr. McCurdy's orchard, containing nine acres, yielded 3,903 packed boxes, each of 46 pounds net, of reputation making fruit. The return from that nine acres was slightly better than $6,000.

The overhead didn't take half of this crop. Bear in mind the first sentence above said: "The overhead takes half of the average crop."

Marketing Antelope Valley Pears

By H. H. Warner, Bureau of Markets

PEAR growers in the Antelope Valley are proving their foresight by planting now to secure a wider outlet in Eastern and foreign markets for the distribution of their fruit when Los Angeles will not be able to dispose to advantage of the entire crop. With the normal increase in production of the young groves, and with many new orchards coming into bearing, the time is not far distant when the marketing problem will be one of chief concern to the entire district. It is estimated that the production this coming season from the valley, comprising groves located in the Little Rock, Palmdale and Lancaster sections, will run from 100 to 125 carloads of Bartlett pears.

Owing to the low humidity of the climate, and the fact that the crop is matured under very dry conditions, with a minimum of irrigation toward the close of the season, the keeping quality of the fruit, when carefully handled, is generally believed to be superior to the pears from the Sacramento district. These same growing conditions tend to produce a pear which is somewhat rougher than the Sacramento Bartlett pear, and one which is not so desirable from the canner's standpoint, on account of the larger waste in peeling. These factors seem to indicate that the Antelope Valley Bartlett will be essentially a shipping pear, and that a comparatively small proportion of the crop will ever find its way into cans. Pear blight is very carefully controlled in the district, and if some method of increasing the humus content of the soil is practiced, there seems no reason to doubt the continued heavy production per acre, which is the dominant feature of these young groves.

As has been the case with several other new deciduous fruit districts in the south, the entire crop has each year been marketed in Los Angeles. The returns so far have been quite satisfactory, especially during the last season, when producers netted from three and a half to four cents per pound. However, growers are pointing to the fact that at the same time that their pears were selling at wholesale in Los Angeles for five cents per pound, that Sacramento River pears were selling in Eastern auctions at from $5.00 to $6.00 per packed box of 40 pounds. With the competition from Sacramento River pears on the local market, the consuming capacity

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Pears in blossom appear on this week's cover and pears at harvest time in the illustrations on the third page. Pears are profitable in California, and we hope there is a bit of inspiration in these illustrations and in the two articles which will lead growers to produce a more perfect crop. The fresh pear shipments from California have a reputation which has never been secured by pears from any other section of the world.

MAKE A SLOGAN

The California Victory Loan boosters want a slogan for the coming campaign. Several have already been submitted; more are invited, and to the makers of the three best cash prizes of $30, $20 and $10 will be given.

The only limit in the contest is the number of words that can be used in the slogan. Twelve is the limit but the shorter the better. A strong, snappy, short battle cry that will express the spirit of the country is wanted. Here are a few of the hundreds that have been submitted: "Don't quit because the kaiser did," "Are you grateful? Loan," "What is victory worth to you?" "You ordered victory, pay the price," "If you don't like our Victory Loan try Germany's."

THE NEXT MAY BE BETTER

Of course it is easy to criticize and do a real injustice, but honestly we do find it hard to see much of real accomplishment in the labors of the congress which ended March 4. These four or five hundred congressmen, drawing their eight or ten thousand per year each, must have some consciences to permit themselves to draw down their money in return for the last year's work.

The most serious effort was not given to originating or doing that which will make the country safe in this crisis in the world's history, but to filibustering and clogging the wheels to prevent real aggressive action. For instance, the filibuster engaged in during the last days of congress prevented the making of needed appropriations in many arms of the government service. Agriculture, especially, will suffer.

However, department heads are planning as best they may to hold in line the efficient working force until the new congress meets.

THE MILK PRODUCERS FIGHT

California milk producers have never been confronted with the problem which has had to be solved by the milk producers supplying New York city. There the price was continually advancing to the consumer with only nominal advance to the producer until the distributors were receiving more than 50 per cent of the consumer's dollar while the producer bore the brunt of all losses and dairymen were becoming poorer with every delivery of milk.

The situation is handled in this week's issue by Leroy Anderson, formerly of the university farm school at Davis and now living in the Santa Clara Valley. Dr. Anderson is temporarily in New York aiding in farm institute work and is in close touch with dairymen. As noted, the California dairymen have not so serious a problem, but at the same time the matter of just division confronts them and the action of New York producers may give a suggestion in the securing of full justice.

Southern California dairymen have been organized longer and more effectively than those of the northern part of the state, but the organization is now becoming general and dairymen are benefiting.

TO HAVE DOG LAW

It begins to appear that the live stock interests of this state—especially the sheep interests—will soon have the protection of a dog law.

A bill providing such protection was introduced in the senate by Senator Benjamin F. Rush, but it had not progressed far on its intricate way before it encountered most active opposition despite the fact that practically every live stock organization in the state had endorsed it as well as hundreds of farmers.

The principal opposition came from city dog owners who objected to paying a tax in addition to a municipal tax, and from certain humane societies.

A hearing was held on the bill at which time both sides were given an opportunity to state their views. Naturally, there was the widest divergence of opinion as to what constituted a fair and just law, but before the hearing was over each side caught the other's viewpoint (as usually happens when well-balanced people calmly sit about a council table) and as a result it was agreed that "the party of the first part and the party of the second part" would work together in the drafting of a bill that would be satisfactory to all—one that would protect the live stock man and not work a hardship on dog owners.

KEROSENE

There have been a lot of trees killed in California in experiments which to the level-headed look so foolish that he has said: "No wonder these trees died." On the other hand, these "foolhardy" experiments have oftentimes developed a most successful orchard practice.

For instance, the sheep herder, whose deciduous trees near his house were practically dead of San Jose scale, said to himself: "This sheep dip will either kill the pests on the tree or the tree," and unwittingly he started the use of lime-sulphur sheep dip as an orchard spray, and it has saved California orchardists millions.

We have seen trees killed with kerosene, but one of our subscribers from the Tehachapi section tells how he has cleaned his apple orchard of woolly aphis by pulling away the dirt from the roots and pouring on the roots and trunk of the tree high grade kerosene. The trees are looking thrifty, continuing to grow, and are entirely free from the pests which mean death to an apple tree if allowed to remain.

We are glad to give place to Mr. Calkins' communication, which is on Page 409, but we give warning to our subscribers to note particularly the last portion of the article in which he refers to the high quality of the kerosene used, and that almost complete evaporation was secured soon after application.

DILUTING THE SOUP

How to knock the H out of the H. C. of L. is the problem confronting many of the housewives of this state. Prices seem reluctant to start downward, that is unless we are referring to prices of farm products on the farm, but over the counter it is practically impossible to find the high cost meeting much discouragement.

This situation has called forth several suggestions which have appeared in the household department of recent Cultivators. One California housewife in the issue of March 8, Page 349, under the head, "Some Anonymous Comment," suggested the elimination of much that is nourishing from the table. In fact, instead of eggs, milk and fats, the writer suggested liberal use of baking powder and water and an occasional rubbing over the soup kettle of a bacon rind or an onion skin to supply some of the needed "makins."

A Napa County subscriber, commenting on this article, suggested that eggs, milk and some other of the discarded ingredients still contain nourishment which is needed by humans, especially by the youngsters. Another communication just received, too late for this issue, has a very valuable suggestion. The lady says that so long as beans are cheaper than water the soup might be diluted with a small portion of beans. Her communication will appear next week.

This may help in knocking the H out of the H. C. of L., whereas some of us were fearing that our anonymous cook might only succeed in knocking the L out of the combination.

CALIFORNIA

And now the postmaster general, or somebody who claims to have authority, decides that the official abbreviation for the word California shall hereafter be composed of the first five letters. In the past the abbreviation has been Cal., while that of Colorado has been Col.—which, it must be admitted, has been somewhat confusing, that is, in consideration of the number of poor writers there are when it comes to a's and o's. But why pick on California? California was a state a quarter century before Colorado was, and the veneration due to age should give California first choice. The three letters were much more quickly written—if one is so driven for time that he cannot spell out so beautiful a word as California. Two more letters take little more time. Admitted. But it would take no more time in the case of Colorado. Color are the first five letters of Colorado, but the first five letters of the word California we refuse to have printed on this page as an abbreviation, and any Californian who is guilty of using such an abbreviation for so beautiful a word should be turned over to a revived vigilance committee who might be empowered to coat the culprit with boiling pitch and hang and quarter him.

Californians have shown some little judgment in this matter of abbreviations and have refused to stand for nonsensical shortenings. San Bernardino, San Francisco, Los Angeles, and some others have at times suffered from such abbreviations as "Berdoo," "Frisco," and, worst of all, "Los." Let all Californians unite in the determination to return to the East all foolish abbreviations and ask for printing or writing out of the entire name—California.

BUILD HIGHWAYS

It has been repeatedly asserted that Paris—and probably the liberties of the world—were saved in 1914 because of the excellent roadways to eastern France. The Huns were every day coming nearer to Paris; the railways were glutted with war munitions and supplies; there seemed no means of getting sufficient men to the front to stop the rush until the city had fallen, but buses, taxicabs, trucks, autos, and everything which was propelled by gas were impressed into service, and thousands, almost millions, of men were thrown against the advancing hordes.

If these roadways meant so much to the liberties of the world in 1914, is it not possible that America may well take the lesson and make provision for the thousands of jobless boys coming home in a roadbuilding campaign? California is already working on two great highways the entire length of the state. In fact, these may be said to be almost complete. There is opportunity for extension and improvement of these great highways, and the system may well be continued through the Northwest and then along the entire northern boundary. Two other great highways along the southern boundary and up and down the Atlantic might some day prove the salvation of this nation.

In any case, there is the transportation of farm products, which is made possible by good roads and would be greatly facilitated by an increase in their number, and the country generally would be benefitted. Scarcely a soul ever questions the advisability of such a great road building campaign.

Let it be so ordered.

Borders of olive trees have been planted around the great cotton plantations of the Southwest Cotton Company, near Phoenix, Arizona.

The New York Milk Fight

By Leroy Anderson

SINCE I am daily meeting with dairy farmers of New York and speak at meetings, I may be privileged to tell Western friends a little of what the fight is all about. And probably Cultivator readers would like to hear of it from an eye witness. It is commonly called a strike of the milk producers but many object to that term on the ground that the farmer is in the same position as any producer who desires a living price for his product and has a right to say what that price shall be.

The Dairymen's League is an organization of New York producers chiefly but also including some from states immediately adjoining New York. It has been in existence about twelve years but not until the fall of 1916 did it possess sufficient strength to be a force in the milk market. The League announced its price for milk for October of that year and the milk distributors of New York City refused to pay it. The result was that on the first day of that month mighty little milk was shipped and within a week the distributors capitulated unconditionally. Since that date the league and the distributors have been able to agree, although during part, at least, of 1918 the federal food commission exercised a ruling hand in price fixing, sometimes to the financial loss of producers. In December last the food commission announced that its influence on milk prices would be no longer exerted. The league then stated its January price to the distributors, who are organized under the name of the "Milk Conference Board." It was not known that this price would not be accepted until the last days of December. The excellence of the league's management and the loyalty of the membership is shown by the fact that scarcely a can of milk left league territory on January 1. The dairymen sat tight and have been tight ever since. Many new members have been signed among dairymen who were formerly outside.

New York City was up in arms immediately with its health and other interested officials lined up apparently against the producers. The district attorney and health officer accused the dairymen of starving babies, withholding milk from hospitals, sick and wounded soldiers and "committing other atrocities with Hunlike cunning and effrontery." The milk conference board carried large advertisements in the city dailies setting forth the board's point of view. In addition to this the city papers were uniformly championing the distributors' cause. Thus the league could have no hearing with consumers until it also placed large ads in the same dailies. The following letter from a consumer may be an evidence of the educative value of such advertising:

"Dairymen's League — Dear Sirs: We note advertisement by the conference board in morning's paper of 1,311,806 quarts received. This must be a falsehood as this section of Brooklyn can't get any milk at any price. In my own case we have three babies and five year old boy and I called up Borden and explained my need. In the last five days we have received but four bottles of milk where we usually have three bottles daily. Where does the 1,311,806 quarts go? We believe if the producers want $4.01 per hundred they are entitled to it. But we don't think the distributors are entitled to the same amount as it costs to produce it. Good luck to you and success to your efforts."

The anti-trust law of New York is known as the Donnelly act and last winter an amendment thereto was passed exempting farmers from its provisions and permitting them to collectively bargain for the sale of their products. New York City officials have asked the governor to recommend to the legislature the repeal of the amendment so that the dairymen may be prosecuted as criminals. We have not yet heard of the governor's making any such recommendation and we don't believe he will. The attitude of the city officials is illustrated in this statement in a New York paper January 4: "Mayor Hylan's administration, District Attorney Swan and the distributors affiliated with the milk conference board got closer together yesterday in their fight against the farmers' organization."

The dairymen are asking simply cost of production for their milk which cost is now determined by a formula worked out by Dr. G. F. Warren of the state college of agriculture at Ithaca and based by him on cost studies on hundreds of New York farms during the past six years or more. It is found that the feed and labor required to produce 100 pounds of 3.8 per cent milk is as follows:

Warren Formula

Grain	33.79 pounds
Hay	43.30 pounds
Other forage	10.80 pounds
Silage	102.50 pounds
Labor	3.02 hours

These items are calculated at current prices and to their sum is added 25 per cent to cover usual overhead costs such as bedding, horse labor, interest, depreciation, etc.

In fixing the price at least two other factors must be considered (1) more cows freshen in the latter part of winter and when fresh produce milk at a lower feed cost than when nearly dry; (2) the market price naturally falls under a surplus and rises under a deficit. Averaging such market factors for a ten-year period, it is found that a correct cost of production is finally obtained by multiplying the cost as determined above by the following percentages for any one month:

	Pct.
January	119.0
February	114.7
March	106.0
April	93.9
May	79.0
June	70.7
July	81.0
August	90.8
September	96.9
October	110.4
November	119.0
December	120.0

The Federal Food Commission accepted this formula in fixing December milk prices. Prior to that, they declined to accept it, hence the great dissatisfaction on the part of the dairymen.

Based on the Warren formula, the Dairymen's League asked $4.01 per hundred pounds for 3 per cent milk, B grade, at the 150-mile zone. This is about 8.5 cents a quart. The distributors charged consumers 17 cents, thus claiming as much money for distribution as for production. No wonder an up-state daily exclaimed editorially "Who's starving babies? not the producer but the grasping middleman!"

At present writing (Jan. 17) some 40 dealers have signed contracts with the league at the $4.01 price. With one exception, all are small dealers with a very few each of shipping plants. The one has 30 plants and is said to be the third largest dealer, exceeded only by Borden and Sheffield farms. The league is confident of an entire break in the dealers' ranks.

Dairymen have been put to tremendous difficulties in handling all their milk at home where usually they carried it daily to a shipping station or had it hauled from their door. All the old and abandoned butter and cheese factories have been placed in commission. Wives and husbands have turned separators, skimmed by hand, churned and worked butter, and all so cheerfully because it is only another fight of right against might. Many localities are raising money to build their own plants and the league is now suggesting a fund of $10,000,000 to erect league plants with a final view of selling direct to consumers. Personally, I feel that this last is the true solution of the milk question. It is in line with our California producers' associations.

The fight is exceedingly well managed. From the league office in New York go daily telegrams to every local president and to every county farm bureau, stating the situation. The farm bureaus have been a tower of strength both in organizing the league in 1916 and in the fight all along the line. Dairymen don't need coaxing into action as in the 1916 strike. They are hanging together to the death if need be. Every farmers' organization in the country is concerned in this fight. If New York city is able to defeat the dairymen and to repeal the amendment to the Donnely act, it jeopardizes similar farmers' organizations the country over, including those in far California.

As I write: The fight is won! Yesterday the Milk Conference Board agreed to the league's price of $4.01 for January milk.

Keep Your Tractor Repaired

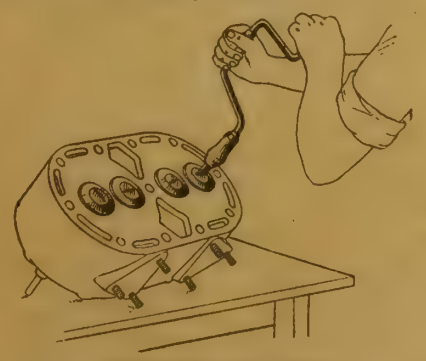
KEEP the tractor and farm implements in a perfect state of repair. It isn't possible always, but make it the rule of tractors. The "Some Responsibility" illustration on this page expresses practically as much in this matter of replacing broken or lost parts as this entire story will be able to convey, but it's worth the reading. It is written by J. E. Waggoner in Tractor Farming.

We omit portions of the article for it lays special stress on the necessity of observing an entire week as National Implement Inspection and Repair Week, which was to be early in March. In California every week is repair week.

Mr. Waggoner writes:

"Can you-al' give a def'nition of responsibility?' said one colored man to another. 'Wal, sah,' said Rastus, 'I's can't give ya a def'nition but I's'll give ya an illustration. S'pose a man suppo'ts his trousers with s'penders and one button pulls off. The other one's got a lot of responsibility. Understand?' 'Yas-sah, yassah.'

"Unintentionally old Rastus illustrated a condition that applies unusually well to many things, and especially well to farm machines and implements. Designers and builders put each bolt, stud, brace, part, shaft, in the machine to help in some way to do the work of that machine. When one of these becomes loose, broken, worn, bent, or in any other way affected, it puts more strain or double strain on some other part. The other part must do double work. Double work soon has its effect on other parts, and on the machine as a whole. As one old fellow put it, the whole thing is soon 'out of kilter.' 'What does out of kilter mean?' asked the teacher of the class. Up went Johnny's hand. 'I know,' he says, 'when pa's back is out of kilter, it means that I have to milk three cows instead of one.'"



* * * * *

The inspiration of cooperation in the observation of such a week is worth much, but the preventing of farm equipment from getting out of kilter is even more effective when done in season.

* * * * *

"Never before in history of agriculture has the price of farm products been as high as now. The time of

Regrinding the Valves

To grind valves use a paste of fine emery dust and oil. Apply some of this to the valve seat, put the valve in place and revolve it about half way around and then back with a carpenter's brace. Repeat this eight or ten times. Raise the valve off the seat and give it part of a turn. Let it drop back on its seat, then repeat the same motion with the brace as before. Do this until a continuous contact is shown around the valve seat. Clean the valve seat and valve stem with gasoline.

Some Responsibility

Broken or lost parts throw more strain and responsibility on other parts.

Agricultural News Notes of the Pacific Coast

Northern California

Colusa expects the early construction of a $250,000 rice mill.

Sierra County reports practically the entire county under deep covering of snow.

The Vegetable Growers of California, Inc., have fixed price of cannery tomatoes at $14.

Live Oak, Sutter County, is appealing to its board of supervisors for funds for bridging the Feather River.

California is producing scarcely one-third of its former wool clip. The present total is about 13,000,000 pounds.

The tractor school at Concord, Contra Costa County, is now in session and instruction will continue until Saturday, March 29.

San Leandro is securing a reputation as a shipper of daffodils. Thousands have been sent this year to Seattle, Tacoma and other northern cities.

Hop growers have contracted for the coming three years; the price for the first year to be 25 cents, 21 cents for the 1920 crop and 20 cents for the 1921 crop.

California wine growers are leading in the effort to set aside national prohibition. The first step will be a referendum petition on the action of the California legislature.

An effort is being made by Sacramento Valley and coast counties to secure a lateral highway from a section north of Cloverdale over the coast range to Anderson Valley.

Secretary Ayers of the Associated Dairymen reports dairmen of California "barely making a living." Present milk prices have been set by the food administration to be effective until May 31.

The conference of farm advisers and delegates began this week at Davis. Other sessions will be held at Berkeley. After adjournment these delegates will visit Southern California points.

A Mendocino County farmer appealed to the courts for relief from trespassing stock, and the ruling was that in that county it is impossible to protect from encroachment of stock unless one does his own fencing.

The Shasta County farm bureau recently held a farm auction at Cottonwood. Seven hundred and forty-seven head of fat hogs were sold, bringing about $20,000. Buyers were present from Portland and San Francisco.

The executive committee of the California Grape Protective Association called a meeting at San Francisco to discuss plans regarding referendum petitions to put the ratification measure on the ballot at the next regular election.

Representatives of the farm bureaus of Eldorado, Placer and Nevada Counties met at Auburn and discussed matter of auction live stock sales. It was arranged that a series of inter-county farm bureau auction sales at Auburn be held at dates to be announced later.

Owners of timber land in Sonoma and Mendocino Counties, who have contracted for removal of wood or timber but who failed to insist on the contractor carrying workmen's compensation insurance, now find that where contractors are not responsible the loss falls on the land owner.

Central California

Stanislaus County is asking for completion of the Oakdale-Sonora-Big Flat highway.

The Pine Flat project is being discussed in Kings County farm bureau center meetings.

The Prune and Apricot Growers Association is making contracts for trays and box shook for members.

Those in charge of the Raisin Day celebration at Fresno are asking for subscriptions totalling $15,000.

John M. Bernstein of Hanford left last week for the East to select Poland-Chinas to add to his herd.

A new olive plant is proposed for Porterville to handle the large acreage in the Poplar-Woodville district.

A federal bee expert, Jay Smith of Indiana, has been making addresses on beekeeping to apiarists of Madera.

Thirty thousand bags of delta onions were sold in Stockton last week. Prices ranged from $3.75 to $4.00 per hundred.

The report of Live Stock Inspector Griffith of Kings County shows unusually healthy conditions among stock of the county.

Porterville Valencia growers expect their crop to ripen about two weeks later than usual, but say it is of exceptionally high quality.

Stanislaus County has 26 rural fire fighting companies organized. These companies cooperate with a motor reserve corps in the city of Modesto.

The Associated Raisin Company last week paid out two and a half million dollars to members marketing Sultanas and Thompsons. This was the second payment.

Live stock people and producers of fruits and small crops have been greatly benefited by the local service established by the market bureau of the department of agriculture.

Porterville Valencia growers do not expect to pick any fruit until the middle of April. Prospects for prices are so good that growers are in no hurry to dispose of their crops.

Grazing fees from the national forests will be of material help to the schools, one-fourth of the fees being turned into the road and school funds. Monterey County's share will be about $1,000.

During the month of February 2,026 cows were tested in the Stanislaus County Testing Association. The best average herd was that of E. Heald of Denair, with 1.57 pounds butter fat per day.

The full board of directors of the state agricultural society appeared before sub-committee on agriculture and appealed for hands off or allowing the state agricultural board to continue methods followed during the past few years.

The Tulare County Growers Association has been formally organized with C. M. Buck, president; H. H. Davis, vice-president; D. R. Jamison, secretary; P. M. Slusser and M. A. Kuhn. Mr. Kuhn will have charge of packing and shipping.

"Agricultural clubs in Fresno County schools have 150 members", says R. A. Burton, in charge of the movement in that county. "We are starting a campaign now among the pig clubs to have every boy and girl grow enough sorghum to raise the pig. The unit is one acre, although, of course, it will not require one acre of sorghum to feed a pig."

Southern California

A field meeting of walnut men was held at El Monte March 10.

Southern California will grow this season 13,090 acres of cantaloupes.

Citrus growers are now discussing the advisability of planting summer cover crop.

Imperial County's asparagus crop is of high quality and is commanding $19 to $20 per crate in Chicago.

Talbert and other Orange County sections are planning for large extension of drainage district.

Ventura County Fair has chosen the middle of August for its opening date. L. P. Hathaway is secretary.

Onion plantings in the Thermal district of Riverside County are showing very satisfactory growth.

N. E. Luce, now with the department of agriculture, is giving instruction to California poultry people.

A shipment of alfalfa seed into Southern California has shown a five per cent infestation of Johnson grass seed.

Poultrymen are finding it impossible to produce eggs at a profit with prices running far below 40 cents as at present.

Early potatoes in the Southwest will aggregate 132,045 acres. This is a little more than half the planting of last year.

The rain, which visited all the state last week, gave Southern California liberal precipitation, ranging from one to two inches.

The Los Angeles city farm center deferred its March 13 meeting to April 10 because of delegates attending Davis conference.

Brawley's first full car of peas to New York market was forwarded March 7. The price ranged from 9 to 11 cents a pound.

Riverside orange growers announce navel crop will be much larger than was estimated in January. The frost injury is also lighter.

An Orange County bean grower is suing a gun club for damage to his land which prevented producing crops in 1918 because of overflow from dam.

Imperial Valley is now sending special live stock trains to Kansas City. The one out on March 20 was filled with steers and sheep. The first train out this season carried over $200,000 worth of stock.

Orange County farm bureaus are continuing their fight for protection of water rights and drainage privileges and are being strongly opposed by gun clubs having large tracts of land in that county.

The Riverside - San Bernardino County Cow Testing Association reports interest increasing. A Stalder cow took first place in the February test, producing 1,700 pounds milk, 73.96 pounds butter fat.

The Hemet-San Jacinto Growers Association recently held its annual meeting, at which it was reported that last season's cling peaches netted door weight, $73.19; yellow frees, $48.44; canning apricots, $50.56; jam apricots, $13.92.

The new road "over the hill" in Santa Ana Canyon has allowed traffic to continue through the canyon, which would have been prevented because of slides and washouts on the lower road. The improvement cost about $40,000.

The Coast and General

Fire on a ranch near Chandler, Arizona, recently destroyed 340 tons of alfalfa hay valued at $10,000.

The latest quotations on American long staple cotton at Eastern mills are 61 cents for No. 1 Pima, 60 cents for No. 2.

The Panhandle Southwestern Stockmen's Association, composed of cattlemen from Texas, New Mexico and Arizona, at the recent annual meeting at El Paso decided to hold the 1920 convention at Tucson, Ariz.

Tentative surveys of the possible irrigation projects within the state of Arizona, by those interested in a land settlement plan for returned soldiers, reveals the fact that there are seven projects where a total of 470 acres would be developed.

Melon growers of the Salt River Valley of Arizona have organized with S. S. Scull of Phoenix, general manager. About 600 acres will be planted this year. Growers are advocating better methods which will result in the production of larger melons.

What is said to be the largest pumping plant in this part of Arizona was installed last month on a ranch six miles southwest of Phoenix. The engine is a 60 horsepower twin cylinder, and the pump an eight inch centrifugal. This lifts 2000 gallons a minute.

A delegation of about 25 farmers and business men of the Imperial Valley have recently visited the Salt River Valley, Arizona, for the purpose of obtaining information relating to the operation of the Salt River irrigation project. While in the valley they were the guests of the Water Users' Association and the Phoenix Chamber of Commerce.

Lectures on dairy topics have been held at the various school houses throughout the Salt River Valley. These meetings are primarily for the benefit of the boys cow testing clubs. State Dairy Commisioner W. A. Barr and Prof. W. S. Cunningham, head of the dairy division of the Arizona college of agriculture, addressed the meetings.

Dry Farming in Arizona is a new bulletin just issued by the Arizona college of agriculture. Experiences in growing dry farm crops in both northern and southern Arizona are given. The bulletin is free to residents of Arizona and others who may be particularly interested can probably obtain copies by writing College of Agriculture, Tucson, Arizona.

The Southwest Cotton Company, Arizona, which is cultivating some 12,000 acres of cotton, believes in diversification. In addition to hundreds of acres of alfalfa, last year they raised a considerable acreage of sorghum most of which was used for forage, but with an improvised syrup making outfit some 500 gallons of cane syrup was manufactured for use on the plantation.

There was a light fall of snow in northern Arizona the first week in March, but except in the mountains and higher elevations this was soon melted, helping range conditions. In the lower elevations, particularly in the eastern part of the state, there is a marked improvement in range conditions. On the headwaters of the White and Black rivers, which flow into the Salt above the Roosevelt reservoir, there is four feet of snow on a level, and in some places much more. There is said to be more snow than for many years. Weather observers predict that the reservoir will be filled before the snow is all melted.

MARKETING ANTELOPE VALLEY PEARS

Continued from Page 407

of Los Angeles for the Antelope Valley pears under present conditions is probably not much over 75 cars in a season. Thus it will be seen that even under present conditions, a large percentage of the crop finds its way to other markets in Arizona, Utah, Texas, etc., largely in mixed cars, shipped by the original receivers on the Los Angeles market.

It has been customary for Los Angeles dealers to contract with individual growers for their crops. The pears are picked in ordinary lug boxes, hauled to the track, loaded into cars and shipped to the Los Angeles dealer. It has been found that when properly handled these pears will keep in cold storage for from four to six months, coming out in fine condition. Last season considerable difficulty was experienced in securing the proper kind of cars, and many shipments had to be loaded into box cars for lack of refrigerator equipment, these very often arriving overheated in Los Angeles. This stock had a tendency to go down very rapidly in cold storage, but some shipments made in cattle cars arrived in better shape on account of better ventilation. Owing to the short haul to the local market, it hardly seems practicable to have empty refrigerator cars iced in Los Angeles and sent to Palmdale or some other point in the valley for loading. The solution of the handling problem, for shipment either to Los Angeles or Eastern markets, lies in the construction at the loading station of a pre-cooling plant, in which the temperature of the pears can be rapidly reduced within several hours from the time of picking in the intense heat of the Mojave desert. Plans are being made for the construction of such a plant within a year or two, at least, at one loading station in the valley. Officials of the refrigerator car lines would, no doubt, be willing to supply adequate equipment if the case were laid before them in the proper manner.

It is needless to point out that in the event that the growers should undertake to ship a portion of their crop to Eastern markets this coming season that some sort of packing sheds would have to be erected, preferably at the loading stations. More care should be given also to the method of picking and handling the crop for long distance shipment. Two or three pickings should be made so that the small fruit will have an opportunity to gain size after the larger fruit is taken from the trees, and particular pains taken to keep sand and foreign matter from getting into the lug boxes. For the first season or two a number of expert packers would have to be brought into the district until the local help became experienced in packing the standard boxes. When these pears are put up to compete with the Sacramento River Bartletts in grade and pack, it is possible that the latter might gradually be crowded from the Los Angeles market.

A committee of growers has been appointed to look into the marketing problem and to confer with representatives of distributing agencies, looking toward the disposition of a portion of the crop in Eastern points for the coming season. An attractive label has been designed which will serve to advertise the district in the East, and a meeting planned to confer with representatives of the State Pear Growers' Association.

Kerosene for Woolly Aphis

By J. E. Calkins.

THE predominance of citrus trees in certain sections of California, compared with the king of fruits, the apple, has rendered the interests of the citrus grower engrossing, at some expense of proper attention to the deciduous orchardist. There has been a preponderance of talk of scale, and gummosis, and bud selection, while the apple grower has been left to wander his way unnoticed along the uphill road that may lead to success. Yet the apple man has a future in California as great as he has in any other state, providing that he has the wisdom to expend his efforts upon those districts of the state that are eminently fitted for the apple; and there are regions in California that will make apples of superlative quality, in satisfactory quantity—apples that will eventually do as much to advertise and enrich the state as its unsurpassed oranges have done. In time there will be as much talk of the pests that assail the apple and its associate, the pear, as there now is of fumigating formulae, and citrus canker dangers, and the invincible mealy bug. But, to proceed—for this does not assume to be a mere dissertation on the growing prospects of the apple orchardist, but, instead, a contribution to the sum of effective knowledge in hand for his continuous campaign against his insect enemies.

During the summer of 1916 we discovered a prosperous colony of woolly aphis in the Alta Vista apple orchard at Tehachapi. From plainting, two years before, till then, none had been found on any tree; now of a sudden we found about five trees that were thus infested.

We went promptly to work, using Black Leaf 40 in various strengths, spraying and drenching the roots. The bugs were set back to some extent but were not exterminated. Apparently a tree would be cleaned up, and then a few aphids would be found on it, and so the fight went on. Incidentally a few other trees caught the plague during the summer; not many, but enough in view of the slow progress of our fight to make it look unpleasant. We dosed and dosed and sprayed and sprayed, and the summer of 1917 showed that the trees on which the aphis first appeared still had all the bugs they needed, and here and there another colony was being located. It could not be said that the outlook was what we could have desired. Through that summer and the ensuing winter the campaign was continued; nicotine, kerosene emulsion, and other approved and guaranteed exterminators were used with diligence. We kept the enemy pretty well buried in his trenches, but on the whole he made all the gains that were made; for the plaguey bug appeared in two or three other spots. A wholesale drenching of the roots with kerosene emulsion, most carefully made, was given during the dormant season of 1917-1918 when the aphides were supposed to be all comfortably hived up about the roots. They did not make very much of a show in the spring, but not a colony was wholly missing, and the number of trees assailed was still a little larger. It was evident that the agencies we had been employing were not thoroughly efficient; in fact, they did hardly more than a good decent friendly parasite would have done, only keeping the number down, so that the damage was minimized. All this time the pest was so well kept under that a majority of the affected trees did not plainly show that they were suffering, and only a small proportion seemed to be losing the fight; but who wants to be fighting such a battle in such a valuable location as a good young orchard?

One day, about the time another nicotine raid was due, if the aphis was to be held in hand, our foreman, C. D. Wood, ventured to do some independent thinking, wholly regardless of the rules of practice laid down by the books and horticultural inspectors. Selecting a tree that was badly infested, badly sapped by a long fight, and apparently doomed by other circumstances, so that if it succumbed to the remedy it could not be counted a loss, Mr. Wood carried down to it somewhat better than a quart of kerosene oil, same as used in lamps and stoves, and gave it a thorough treatment. With a hand sprayer he gave the tree a good mist of oil; one branch that was the residence of a healthy settlement of the aphis he doused in the oil for something like five minutes, by immersion, and then, removing the earth from the roots, he poured all the oil left, fully a quart, on the roots and the ground about them, covering this radical experiment well out of sight by replacing the earth by loose shoveling.

"This was in the middle of the month of May. By the end of that month, as Mr. Wood reckoned, that tree would be good and dead and out of its trou-

RACINE
"COUNTRY ROAD"
—The Tire of Extra Tested Quality

BIG dividends in extra mileage are paid by the Racine Country Road tire. It's in a quality class all its own. You hear only good words for this Racine Rubber Company product. It gives true tire satisfaction.

Extra Care—Extra Wear

Careful, painstaking Extra Tests are applied to each step in the construction of Racine Country Road tires. Each yard of fabric is extra tested; all rubber stock as well.

This extra care in the factory means extra wear on the road. On your car, the Racine Country Road will confirm the good judgment of those thousands who use it now. It will pay you to know your nearest Racine dealer.

For your own protection be certain every Racine Tire you buy bears the name

Racine Rubber Company, Racine, Wisconsin

RACINE TIRES

RACINE RUBBER COMPANY EXTRA TESTED TIRES

The Samson is the "big boss" of barrel sprayers combining a 50-gallon barrel and a pressure tank on a sturdy base. Maintains 150-lbs. pressure and thorough agitation.

Why Run The Risk?

RECORDS prove that fruit and farm crops are notoriously uncertain sources of income. Why increase that risk?

By consistent spraying avoid the peril of bad years due to bugs, worms, scale and blotch. Guard against expensive delays in spraying by using Deming time-tested equipment. 40 years of study frees you from the high cost of "experimenting". Get the master spray-book—the Deming catalog, showing 16 outfits for every spraying need, and the latest, safest developments in accessories, nozzles and spray-guns. Gladly sent free on request.

Germain Seed & Plant Co.

560 Main Street Los Angeles, Calif.

bles. He was fairly confident that he had hit upon a remedy that would be as thorough as that applied by one of our neighbors who fired a large pile of brush to windward of one of his infested trees and let the blaze sweep through it for five minutes; but still, he argued, an apple tree might not object to a reasonable dose of kerosene, and it was certain that woolly aphis was killed by it at the touch. His armor of wool was a sure defense against ordinary forms of moisture, even turning all but the most heroic administration of Black Leaf No. 40, but it sopped up straight kerosene like a blue blotter. His gray hairs were not respected by it in the least. They wilted down into a sodden mass, and his undefended body was dead in very short order. It was too much to expect that the tree would escape some ill effect of such a drastic cure, but Mr. Wood fell back upon the argument of the shipwrecked sailor who built a fire in the bottom of his open boat, reasoning that the water could not come into the fire, and it was sure that the fire would not burn down into the water. "I figured," he says, "that the tree was so full of sap that it would not take on any of the oil and that the air and the ground might take up that oil before it could do any harm; anyhow that tree was as good as gone away and nothing I could do to it would hurt it any."

Next day that tree was free from visible enemies of any and all kinds. Dead aphides were clinging to it, but no live ones were in sight. The tree itself was almost free from any show or trace of oil. Its bark and leaves looked clean and normal. A week later it was fresher and greener than it had been, as clean as a Dutch kitchen and looking livelier than it had looked for a year. By June, a month later, when it should have been in the sere and yellow leaf if that clinic was to kill it, it looked very visibly thriftier, its foliage fuller and of a darker green, and its bark smooth, fresh and healthy. It was growing.

Arguing from this example that kerosene was death to the aphis but fine for an apple tree, Mr. Wood went through the whole 50 acres, repeating that initial experiment on every tree that showed the infestation. The results in all cases were identical; the trees were cleaned and began perceptibly to improve. By the end of August nobody would have had a suspicion that any one of them had ever seen a woolly aphis. Clear down to the cold days when they shed their leaves they continued a consistent show of renewed vigor and uninterrupted good health and growth. If the oil left any mark on them at all it was a cleaner, smoother, more satiny bark and a cleaner leaf. No sign of aphis has been seen on any one of them since. That one dosage did infinitely more to clear out the aphis than all the preceding fight put together. In fact, as far as we have since been able to judge by careful watching, its results seem to have been 100 per cent perfect.

In this work only the best grade of kerosene was used; Standard Oil Co's. Pearl oil. Presumably the manufacturer tells the truth when he represents this oil as free from asphaltum or other harmful, base ingredients. In the open air it is soon evaporated from the tree, but it stays on long enough to make very sure of the bug. In the ground it is doubtless to be found still, but it seems to do no harm. A kerosene less thoroughly refined, burning with more smoke and smell, and evidently carrying more or less of basic content, might not work so well with the tree, though there is no doubt it would do as well for the aphis. But at the relative cost of one treatment with kerosene and endless palliative fighting with other insecticides the cost of cleaning an orchard with good oil is inconsiderable. We regard the experiment as phenomenally successful; and, in the hope that it may be of aid and comfort to other apple growers who are not more than holding their own in their battle with this plague, the details of this little story are submitted.

The Easiest Riding Light Car Built

Correct spring suspension and proper weight distribution have given the GRANT SIX an unbeatable, world-wide reputation for ease of riding. People who have ridden in other lightweight cars are amazed at its superiority. Get a ride in the GRANT SIX. Prove for yourself that it is really a comfortable light car.

You will find the GRANT SIX has the most powerful overhead valve motor of its size ever built—that every part is accessible—that crank shaft and connecting rod bearings are extra large. In every detail this motor is finely built. It is now in its fifth season, refined and improved, with a splendid reputation for service and reliability back of it.

GRANT SIX owners average 20 miles to the gallon of gasoline, 900 miles to the gallon of oil and 7000 miles to the set of tires. Some do even better than this.

The GRANT SIX typifies the latest style ideas in body lines, in body colors, in upholstery and details of finish. The top has the popular "Gypsy" curtains with oval plate glass lights in the rear. It is made of best grade "Neverleek." The hood fits tightly and neatly on a handsome aluminum ledge. Every detail reflects quality. At the big shows everywhere the demand for the GRANT SIX has surpassed all previous records. For genuine value buy a GRANT SIX.

Experiences With Summer Cover Crop

By Robert W. Hodgson.

AT the recent Citrus Institute held in conjunction with the Orange Show at San Bernardino, the discussion a number of times centered upon the summer cover crop in the citrus orchard, growers evincing a decided interest in the subject. At that time the writer was asked a number of questions regarding instances where the summer cover crop had affected the set of fruit, amount of water necessary for its success, time of planting, desirable crops and other matters pertaining to the subject. Not having expected to be called upon, the writer naturally was not able offhand to present what material he has gathered upon this subject in as suitable form or as much detail as he would have liked. He has therefore prepared the present article trying to bring together the facts as he sees them regarding the growing of summer cover crops in citrus orchards in the light of what experimental work has been done as well as the experiences of growers in the past.

Summer cover crops may be grown in citrus orchards with at least two distinct objects in mind, the first being to provide for the building up of the soil through the addition of readily decayable green organic material; the second, and of especial interest to growers of navel oranges, to aid in the setting of satisfactory crops of fruit.

For Green Manure

Summer cover crops for the first purpose have of course been grown to a limited extent for a number of years, particularly in orchards where some winter intercrop has been grown preventing the raising of a winter cover crop or in localities where the winter cover crop has not proven very satisfactory. During the last few years, however, the growing of the summer cover crop for the addition of organic matter has enjoyed a considerable extension and bids fair to become a regular practice in many sections. For this purpose, in the past no better crop has been found than the blackeye bean or cowpea, although buckwheat has been used to a limited extent. For green manure the qualities desired in a crop are of course ability to make a heavy tonnage with a minimum of water and in a relatively short time, and the cowpea apparently excels all other summer growing crops tried up to the present time in these particular qualities. The ordinary field cowpea has been used with considerable success but more desirable varieties seem to be the Clay or Whippoorwill, both of which seem to make a faster growth and consequently more tonnage. Other crops which have been tried out in a small way and will be given larger trial this season include the soy bean and velvet bean.

For best results these crops should be planted when the soil is warm which means not earlier than the latter part of April or the first of May. If planted earlier a poor stand and stunted growth is apt to be the result.

In the heavier more retentive soils one extra run of water or at least two or three will usually suffice for the cover crop but in the lighter soils as much as half again the usual amount may be required for success. In any case one must be equipped so that a sufficiency of water for both crop and trees may be supplied, else instead of being a benefit the cover crop actually results in injury.

The cover crop should, of course, be turned under while still lush and green, which usually means some time in July or August, depending upon the time of planting as well as weather conditions.

For the "June Drop"

For the prevention of "June drop," however, it is imperative that the

HOW TO FERTILIZE

Every farmer knows that plants need Food as much as cattle. He knows, too, that plants cannot get all the Food they need out of the ground alone. He must supply them with certain Foods himself, or they will not thrive and bear their full yield of fruit. Exactly as he supplies hay and oats to his horse, so he must supply Nitrogen and phosphate to his plants. He may buy these in the open market exactly as he does his hay or his oats, or he can buy them in combination. Moreover, there is no secret value in the "complete fertilizer," it is nothing more nor less than the ingredients combined and sold at a higher price. Nitrogen is by far the most expensive as well as effective of plant foods, and it will pay the farmer well to stop and think before he buys it in this combination form or waits season after season for legume nitrogen, or organic nitrogen to become available.

These compounds generally averaging 8-2-2 do not supply what nature requires, for the crops take out more nearly the equivalent of a 2-4-3; that is why we can in most cases and in most soils use Nitrate alone as a straight top dressing, and the earlier the better.

Translated into Commercial Fertilizer terms, the comparison is as follows:

	What Nature Requires	What the Average Brand Supplies
Phosphoric Acid	2.02	8.00
Nitrogen	4.33	2.00
Potash	3.65	2.00

THE BEST AND CHEAPEST NITROGEN

The cheapest and most practical form in which to furnish Nitrogen to plants is Nitrate of Soda. In the rainless region of Chile are stored away vast quantities of Nitrogen in what are known as Nitrates—the only form in which Nitrogen can be utilized by plants. The Nitrogen which exists in organic, vegetable or animal matter—that is, roots, stems, dead leaves, weeds, leather, tankage, dried blood—and also Nitrogen in the form of Ammonia salts, must first be changed to Nitrate before it can be taken up by plants. This change is dependent upon conditions of weather. If the season be backward, or there be a prolonged drought, this change may be so retarded as to deprive the plant altogether of Nitrate Food at the very time it needs it most; moreover, Nitrogen in the form of Ammonia salts leaves acid residues in the soil. Nitrate of Soda, on the other hand, is entirely independent of weather and leaves the soil sweet. It is immediately available under all circumstances, for it is readily soluble, and as soon as it comes within reach of the roots of plants it is taken up by them. It can, therefore, readily be seen that the practical value of various forms of Nitrogen ranges from nothing at all, where conditions of temperature or soil prevent Nitration, to 100 per cent as Nitrate of Soda, where Nitration has already completely taken place. Moreover, the process of transforming the Nitrogen of cotton seed meal, dried fish, dried blood, tankage, and other Nitrogenous constituents into Nitrate is very wasteful, for much valuable Nitrogen is lost in the process, as well as by natural oxidation. Official soil experiments have shown that 100 pounds of Nitrogen in these organic forms has only about one-half to three-fourths the manurial value of 100 pounds of Nitrogen in its NITRATED form of Nitrate of Soda.

A GREAT SAVING

In view of these facts it seems extraordinary that farmers should continue to purchase their Nitrogen in compounded form in a ready mixed fertilizer, when they can procure it much cheaper, and ready for the plant's immediate use, in the form of Nitrate of Soda.

Nitrogen is often in a form which is not available as food for the plants, for it must first be converted into Nitrate. The time required to do this varies from a few days to a few years, according to the temperature of the soil and the kind and condition of the materials used.

It must be recognized that the grower should have a chance to derive some profit from the use of a fertilizer, and wise buying is a prerequisite to successful use.

HOW IT HELPS CROPS

If a young pig or a young calf does not have an abundance of the right kind of feed when it is young, it becomes stunted in growth, and never recovers fully, no matter how judiciously it is afterwards fed. The intelligent cultivator has learned that this holds good in the feeding of plants. Nitrogen is the element which enters most largely into the building up of the plant itself—roots, stems and leaves. Most plants need to take up the greater part of their Nitrogen during the early stages of their growth, as in oats. It is plain, therefore, that the cultivator cannot afford to overlook Nitrate, and thus endanger the chances of his crops, which must have Nitrogen in a form the growing plants can use. The presence of Nitrate at the outset enables the plant to get its food WHEN it needs it most, and develops a vigorous growth of roots, leaves and stems capable of withstanding the scorching rays of the sun or sudden changes of temperature, disease, or the attacks of parasites. It is then able to mature properly. Without Nitrate present, the young plant will fail to attain stem and leaf growth sufficient to mature its fruit or grain. Why take chances with makeshifts or substitutes when the real thing is 100 per cent. effective?

Nitrate of Soda is of high value for early crops, such as peas, corn, beets, cabbage, where rapid maturity is desirable. It is a special help to hay, grain, rye, wheat, timothy, cereals and orchards, all of which are unable to obtain sufficient Nitrogen from the soil just when they need it. It is a great specific in the production of sugar beets, potatoes, cotton, cane and apples, or other fruits.

Small fruits, such as blackberries, currants, raspberries and gooseberries, which need a steady, even growth, are greatly benefited by Nitrate of Soda, which can be furnished all ready for digestion when the plants require it.

The highest agricultural authorities have established by careful experimentation that 100 pounds per acre of Nitrate of Soda applied to crops has produced the increased yields tabulated as follows:

Apples	100 bushels
Barley	400 lbs.
Corn	280 lbs.
Oats	400 lbs.
Rye	300 lbs.
Wheat	300 lbs.
Potatoes	3600 lbs. Tubers.
Hay upwards of	1000 lbs. Barn cured.
Cotton	500 lbs. Seed cotton.
Sugar Beets	4000 lbs. Tubers.
Beets	4900 lbs. Tubers.
Sweet Potatoes	3900 lbs. Tubers.
Cabbages	6100 pounds.
Carrots	7800 pounds.
Turnips	37 per cent.
Strawberries	200 quarts.
Onions	1800 pounds.
Asparagus	100 bunches.
Tomatoes	100 baskets.
Celery	30 per cent.
Hops	100 lbs.

Nitrate of Soda is a plant tonic, and an energizer; it is NOT a stimulant in any sense of the word.

It may be used alone without other fertilizers, as a top dressing, at the rate of 100 pounds to the acre.

RESULTS IN CALIFORNIA

For four years in succession samples of Nitrate of Soda were sent to farmers. In each experiment two patches were marked out side by side. One received an application of Nitrate of Soda at the rate of 100 pounds per acre, the other had none. The following are fair samples of the results reported:

CROP—BARLEY

Name, A. B. Ganyard,
P. O. Address, Lathrop,
R. F. D., 1,
State, California.

Plot without Nitrate produced average.

Plot with Nitrate produced extra good.

Date of applying the Nitrate of Soda, March 20.

Date of completing harvesting of the crop, cut for hay in June.

Why Europe Makes Bigger Crops Than the United States

Average Production of European Crops is as follows:

Wheat	33 bushels per acre
Oats	45 " "
Potatoes	199.84 " "
Cotton in Egypt	400 pounds "

Average Production of American Crops is as follows:

Wheat	14 bushels per acre
Oats	40 " "
Potatoes	97.15 " "
Cotton	185 pounds "

Europe uses a Home-Mixed Nitrate Fertilizer containing 8 per cent of Phosphoric Acid and 4½ per cent of Nitrate Nitrogen.

America uses a Fertilizer containing 8 per cent of Phosphoric Acid and 2 per cent of Nitrogen which is mostly not readily available.

The difference in yields is largely due to larger amount of Nitrate Nitrogen used in Europe per acre as **Nitrate of Soda.** Our small American acre yields are due to failure to appreciate this necessity.

Write for "What Chilean Nitrate Has Done in California."

Chilean Nitrate Committee, Box 248, Berkeley, Cal.

Remarks: Could see a marked difference in the two plots at quite a distance. I shall always use NITRATE OF SODA on my Barley.

CROP—BARLEY

Name, R. R. Pefley,
P. O. Address, Murrieta,
R. F. D.,
State, California.

Remarks: The Nitrate of Soda test I put out in the Spring on Barley yielded considerably more than twice as much as the adjoining plot. The results are so good that I intend to use the Nitrate on my grain crops in the future.

CROP—CANTALOUPES

Name, J. F. Brumund,
P. O. Address, Turlock,
R. F. D.,
State, California.

Plot without Nitrate produced 20 crates.

Plot with Nitrate produced 26 crates.

Date of applying the Nitrate of Soda, May 15.

CROP—OATS

Name, Chas. Beedle,
P. O. Address, Los Gatos,
R. F. D. 15, Box 108,
State, California.

Plot without Nitrate produced 133 lbs.

Plot with Nitrate produced 190 lbs.

Date of applying the Nitrate of Soda, March 15.

Date of completing harvesting of the crop, May 31.

Remarks: The crop of Oats was harvested for hay instead of grain. The Nitrate did not have a fair test as there wasn't any rain after it was applied.

CROP—CITRUS

Report of Results from the Use of Nitrate of Soda on Oranges by D. Mackenzie, Pomona, California.

"I bought an orange grove very much run down, and followed practically the method you recommend in the bulletin. From a crop of 106 boxes, there is now estimated 2,000 boxes on the trees, and the limit has not by any means been reached."

THE RATIONAL AND IRRATIONAL USE OF NITRATE OF SODA

Everywhere in the world where there is progressive experiment station work, the unique qualities of Nitrate of Soda are putting it ahead of every other Nitrogenous plant food. Nobody who advocates the rational use of fertilizers ever recommends such large quantities of Nitrate of Soda per acre as would result in any abnormal accumulation of alkali salts. Moreover, the use of acid phosphates, associated as they are frequently with sulphate of lime, converts any alkali residue into harmless forms of soda.

The use of potash salts tends to leave acid residues in the soil, as do acid phosphates even when rational quantities of acid phosphates and potash salts are used. Nitrate of soda is needed to help neutralize these residues.

In most of our experiments where Nitrate was used alone at the rate of only 100 pounds per acre, with no further application of fertilizers to the plots, a decidedly marked effect was noticed. This speaks very well indeed for Nitrate of Soda not leaching out of the soil. The readily soluble elements of fertility are the readily available elements. The natural capillarity of soils, doubtless, is in most instances a powerful factor in retaining all the readily soluble elements of fertility, otherwise all the fertility of the world would, in a season or two, leach away into the ocean and be permanently lost. A case is yet to be seen where the after effects of Nitrate are not distinguishable, and in most cases such effects have been marked. The 2,000 or more tons of active service soil in an acre of land has a powerful holding capacity for all the useful, available elements of fertility.

HOW TO USE NITRATE IN CALIFORNIA

Recent experience in California suggests that Nitrate may be applied as a top dressing to best advantage as soon as growth starts in the Spring, or even better, before seeding or planting.

Generally in rainless or very dry countries staple crops root very deep in search of water and nourishment. Since there is little or no surface water to render plant foods available even when present, Nitrate of Soda should be thoroughly cultivated in, as should other fertilizers, so that they may properly nourish the plant roots of the seeded and cultivated crops during the growing season. Most fertilizers should not touch the seed.

Nitrate has no acid residue to leave behind and it will leave nothing deleterious in your soil after using. It will enable you to overcome the effects of droughts and frosts in the shortest possible time and prolong the bearing period of your trees. Nitrate does not have to wait to get busy.

PROOF POSITIVE

In a twenty-year test to determine the value of various sources of Nitrogen, the New Jersey Experiment Station found "that crop yields and the percentage of Nitrogen recovered in the crop were greater when Nitrates were used."

Official figures are—

"If we assign to Nitrate Nitrogen a value of 100, then the relative availability of the four materials stands as follows:

Nitrate of Soda	100.0
Ammonium Sulfate	76.1
Dried Blood	62.0
Manure	52.4

This research was published in "Soil Science," April, 1918.

VALUABLE BOOKS FREE

Numerous books have been written on the value of Nitrate of Soda in agriculture. These books deal with questions on which progressive farmers cannot afford to form incorrect opinions.

If you are farming to make money you owe it to yourself to send for the free books which pertain to your crop. If you want to know what farmers have done both in America and Europe, who grow the same crops as you do, these books will tell you. If you have any doubt on how valuable Nitrate of Soda would be to your particular crop, you should get all the available information you possibly can on the subject.

These booklets are free—write for them, addressing

EKSTEIN NURSERIES Modesto, Cal.

Production of Celery in California

By R. G. Risser, Assistant Truck Crop Specialist.

PROMINENT among the vegetables shipped each winter from Southern California and foremost among the vegetables shipped each winter from Central California is the celery crop. Beginning, as it does in the middle of autumn, the celery shipping season is well under way on the first day of the winter months and it continues, interrupted only by severe winds, serious freeezs, or exceptional market conditions, until all the crop is moved or until early spring weather develops a seed stalk of objectionable length.

Separated by some 400 miles of intervening territory, the celery growing districts of Central and Scuthern California are different in several respects. Shortage of rainfall has the most serious effect in the El Monte district of Los Angeles County. Blight is also one of the difficulties encountered in Southern California and insects are sometimes an important factor. In Central California severe frosts are the principal trouble, and the past season heavy unseasonable rains cut down the crop.

The differences in seasons are no less striking than the differences in districts, and the contrasts between the past two seasons are especially marked. These seasons are notable in several respects and are extremes in more than one way. The year 1917-18 was probably the greatest on record in this state for area planted while the season 1918-19, with approximately half the acreage, was the shortest one in years. The season 1918-19 has broken all records for high prices, while the season preceding was considered an unsatisfactory one as prices failed to meet the high cost of production in many cases. The season just closed has been a remarkable one in regard to early banking, quick blanching, prompt cleaning up of the crop and the marketing of both high grade and inferior stock, while the previous season showed a sluggish movement, discriminating market, tendency to hold in the bank for some time, and a surplus of unsalable stock at the close of the season. The insistent demand which continued throughout the past season resulted in growers shipping their stock before it had reached full size in many cases, and the yield and quality was correspondingly reduced while the tendency to hold produced good sizes and excellent yields during the previous season. Yields for the season 1918-19 were further reduced by damage from dry winter weather in Southern California and by September rains and January frosts in Central California. Perhaps the most important difference of all in the two seasons has been the transportation service which has been satisfactory this past winter and very unsatisfactory the winter before.

The bureau of markets reports 2758 cars rolled during the season 1917-18, and if the movement in mixed cars, boats, and auto trucks was included the shipments would probably exceed 3000 cars. In spite of the short acreage and generally light yields this season, the total production of marketed celery in California in 1918-19 is approximately half as large as in 1917-18 because everything is being shipped out this season. Perhaps the most striking fact, however, is that the gross return to the growers of the state is practically as large as when they grew the record acreage.

Lawns on Alkaline Soils

Written for California Cultivator By Ernest Braunton

A CORRESPONDENT living between Compton and thecoast, in damp sandy soil, wishes to know the best material for a lawn. She wishes blue grass if possible, but "would consider Bermuda grass if it did not grow so coarse here."

Blue grass is out of question unless a heavy coating of black adobe is put on top of the sand after the latter has been heavily enriched with stable or dairy manure. The lawn would not be worth the trouble and expense. White clover would do much better than blue grass, but needs a rich soil and some heavy soil added. Lippia should do fairly well but it is a tropical plant and in winter would lose all its leaves in the Compton district. As land is stated to be "covered with a thin stand of very coarse and tall Bermuda grass," I feel safe in saying it is not Bermuda grass at all, but Distichlis spicata, the salt grass.

Bermuda grass is not coarser in sandy soil than it is in heavy soil. Though nearly all sow blue grass, in a few years 90 per cent of the lawns and 90 per cent of each lawn is Bermuda grass. Then why not plant it at first? The area should be spaded or plowed at once and harrowed and cultivated all summer and raked over several times to get out every vestige of the salt grass or at least kill it by drying all summer. After the first heavy fall rain it should receive a good coat of manure, a heavy coat, and be plowed or spaded as deeply as is possible.

At intervals during winter, after each heavy rain it should be cultivated, hoed or spaded and harrowed or raked, putting on some good manure before the last or one of the last cultivations. You may then, about April, either sow seeds of Bermuda grass or the roots chopped up fine and harrowed, or raked in. The soil should be kept in very moist condition until these roots have taken hold on the soil. Keep it well watered during the first summer and your troubles will thereafter be few and light. Give a top dressing of fertilizer in April of each year. Before lawn is sown the whole should be enclosed by a one-by-six redwood batten sunk edgewise in the soil till the top edge is level with lawn surface. This treatment will give you a good lawn.

The Common Myrtle

Last week, while at Riverside, I saw a shrub of Myrtus communis, some eight feet high, nearly globular in form, dark rich green in color, and apparently about a quarter century of age. It was the finest shrub I ever saw while in the city. We have called it the English myrtle because it was introduced from the mother country, but it grows in various parts of the world. Being common in England, where the climate is at all times moist, we would hardly expect to see one so fine in California of the south. It is apparent that it thrives inland better than in coastal districts, for this one had neither food nor care, in ordinary soil, yet in appearance it was the finest I ever saw, and the darkest in color.

Dual-Purpose Vine

While we are searching for evergreen vines that bear edible fruits, there comes to us from the Himalayas an evergreen raspberry of gigantic growth. It runs up to 15 feet, is hardy wherever the orange is. It bears handsome foliage and an abundant crop of yellow berries of fine flavor that are excellent for home use but too soft for shipping. Better try one in place of some old scraggly vine that is neither useful nor ornamental.

The White Sapote

Many growers, well versed in tropical fruits, hesitate to plant Casimiroa edulis, the white sapote, for the reason that seedling fruits are variable in size and quality and the trees are very, very often but "shy" bearers. The best, or one of the best, is the Harvey, planted at Sierra Madre, named for the introducer, the late J. C. Harvey of Vera Cruz, Mexico, and formerly a well known plant lover of Los Angeles. Budded trees of this variety may be obtained and that is the only kind one should plant. A budded tree requires no more space or care than a seedling and the planter know what he will get and when. The seedling may never produce a fruit, or but a few.

The Paraguay Guava

The feijoa sellowiana fruits are by

some in the local field called the pineapple guava, though who first did so deponent saith not. It was doubtless done to make better sales for the plant, and it has somewhat of a pineapple flavor—at least some of them have. In its native South America it is called the Paraguay guava and so catalogued by the dealers there, so to me that is the proper name. The seedlings are of doubtful value except as ornamentals. Some bear fine fruits; others none. Grafted plants may be had where the scion has been taken from a scion of a good family strain, a good sign it is a reliable sort to purchase. Why bother with those of doubtful value when you may have the best?

Showy Poppies

All kinds of poppies have been grown in my garden but I like Shirley better than any for they are delicate in appearance while the common poppies of the opium section flaunt their brilliant colors too brazenly. But where one wishes a strong glare of color these large tulip-like poppies are necessary. Of all I have grown I like the Admiral best. It is a large single white with a deep band of scarlet around the top. I have grown it in full sun, where all poppies are supposed to thrive best, and also in partial shade, and in the latter position they were largest and best.

Fremontia Mexicana

Too few of our people know our native Fremontia Californica, though a desirable shrub for the garden. Now there has been found a new species in Lower California that has larger flowers and leaves and the flowers are darker in color than the better known species, being almost orange, whereas the other is a buff. Those who have seen it state it is of better garden value than the F. Californica. Both species do well in the hottest and driest situations.

Garden Shrubs

The use of shrubs in gardens is somewhat puzzling. Theoretically shrubs are planted as a foil or background for flowers. But what if the shrub when in flower is as handsome as the flowering plants that hide it. Shall we then treat them as shrubs or as flowers? It is better to use low growing plants in front of shrubs of good value, or if the border be broad enough, plant smaller shrubs in front of large ones. The proper use of shrubs is quite a puzzle both to the amateur and the professional.

The Banyan Tree

At Miami, Florida, there are several trees of Ficus Benghalensis, the banyan, in most vigorous growth. There are frostless spots in California where they could be grown if well supplied with water, for they grow in low lands and really should have a humid atmosphere. Therefore coastal regions would suit them best.

An oriental traveler named Forbes first published a description of the huge banyan tree in India where Alexander the Great encamped his forces in 326 B. C. It is said 7000 of his troops were sheltered beneath this one tree. Aerial roots grow down from the main and almost horizontal branches, take root and become trunks. This huge Indian tree now has about 4000 trunks and covers a space nearly 1000 feet across. Its growth in India is very raipd and in a hundred years from the seed a tree will cover a large tract.

JAIL FOR FIRE BUGS

The second annual conference has just ended in San Francisco of specially selected forest rangers who will take the trail of the fire bug this coming summer. Uncle Sam has quit fooling with those who can't or won't understand his conservation policies and who insist on burning up his timber, stealing his forage, illegally killing fish and game on the national forests, or otherwise violating the laws. He has ordered his forest rangers to follow the trail wherever it leads and bring them in. During the last year, over 100 convictions for fires alone were secured by the national forest officers, in this state, while the number of man-caused fires was reduced by 50 per cent and the damage by 75 per cent.

International Tillage Brings Bigger Yields and Better Grades

MANY are the uses, and great is the value of a good disk harrow. More than any other farm tool, its proper use takes the gamble out of crop raising. The perfect seed bed that causes quick, strong germination of the seed, rapid growth of the plant, and even maturing of the crop, cannot be made without a disk harrow. A good one costs so little, and plays such an important part in determining the yield and value of your crops, that its purchase deserves really serious consideration.

Knowing the character and condition of your soil as you do, you will know whether to buy a two or three-lever harrow, a tandem, or one of our new leverless tractor disks, but, whichever style is best for your work, you will find a high-grade, up-to-date harrow of that style in the International line, and of a size, suitable to your power equipment. We have sold disk harrows for years, but never was the line so complete, or of such high quality, as the line we offer for 1919. The local dealer will explain the value of the many features we have not space to mention here.

Other useful implements in this line, each built for its own special work, are open end, closed end, and flexible peg-tooth harrows, spring-tooth harrows with single and double end teeth, and one-horse cultivators with every kind of tooth and shovel equipment. These, too, can be seen at the local dealer's place of business, or we will send catalogues on request.

Glance over the list of machines in this advertisement and write us for full particulars about any in which you may be interested.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Ringbone

A subscriber at Woodland, Ray E. Smith, protests against firing as a cure for ringbone, and gives the following remedy which he assures us was never known to fail if properly applied:

Take one drachm finely pulverized corrosive sublimate. Add this to three drachms of Venice turpentine mixed well together. Apply a teaspoonful to the enlargement, rubbing it in well. Two applications are sufficient. Grease well with hog's lard two days after the application.

Liver Trouble

What is the matter with my White Leghorns? They stand around and droop. Some pass an unformed, soft-shell egg, all white. After a couple of days they die. Have some meal, oyster shell, dry bran and skim milk before them at all times. Feed wheat and rolled barley morning and night. Comb and wattles turn very dark and some pass watery, light-brown droppings. Have good clean chicken house and acres and acres on which to run. —Subscriber, Oroville.

From the dark red combs and the diarrhoea I am inclined to think your hens are suffering from liver trouble or from a combination of liver trouble and indigestion due perhaps to the rolled barley, the hulls of which are hard to manage if heavily fed. A dose of Epsom salts all round, about half a teaspoon for each bird, mixed in a moist mash and fed twice a week for several weeks will help to clean out the digestive organs. Then discontinue the rolled barley for a while, substituting sprouted whole barley. Feed plenty of green and mix a little charcoal in the bran. Better than bran alone is the regular dry mash mixture of several kinds of ground grain and beef or fish scrap which is used by most poultrymen, and better than sweet skimmed milk is sour skim or buttermilk. The lactic acid of the sour milk has an extremely wholesome effect on the digestion of all fowls.—J. A. K.

Trap-nesting

Would you kindly inform me as to trap-nesting? How it is done? Also how to test hens for egg production? Is the Hogan system a sure test? Also the standard price on pure-bred R. I. Red eggs per setting?—Subscriber, Los Banos.

There are several good trap-nest models, one of which, the Oregon trap-nest, is fully described, with directions for making, in "Poultry for Profit." If you prefer to buy them ready-made they can be purchased from any large poultry supply house. The principle of all is the same. When the hen goes on the nest she closes the door, and is obliged to remain till the attendant lets her out—and makes a record of the egg she has laid. The Hogan system is highly recommended by Professor Dougherty and other experts and is used by many commercial poultrymen. Probably it is as certain as any test that can be made before the hen begins laying. You ought to get pretty good R. I. Red eggs from exhibition stock for $5 per setting. Pure bred eggs from utility stock cost less, but they are not always satisfactory.—J. A. K.

Hens Poisoned

Can you tell me what the trouble is with my hens? One died a few days ago and another yesterday. They sit still and when compelled to move tremble badly. The first died within a few hours after I found her, but the other bird lived about 48 hours. They have had a buttermilk mash to run to and have been feeding Egyptian corn, and the last two weeks barley. They run out in the grove on sweet clover. We have had an average of 12 eggs a day for two weeks from 17 Barred Rocks.—Subscriber, Upland.

When death occurs as suddenly as this, poisoning is always to be suspected, especially when the hens run at large. Your ration is good, but the hens may have found something on range or had something thrown to them, which has poisoned them. Moldy table scraps, spoiled meat, a dead chicken left unburied, copper or arsenic from sprays used on fruit trees, or nitrate of soda used for fertilizer and dug up by the hens in scratching for worms, might any one of them have affected fowls as these were affected. If you can find out what the poison is in time to administer its proper antidote, which is generally white of egg, milk or a mucilaginous drink like flaxseed tea, you may save the patient, but prevention is usually the only cure.—J. A. K.

Long Staple Cotton

How much does long staple cotton sell for in the Imperial Valley, the seed and the lint; how many pounds of seed cotton does it take to make a bale of lint; and several other questions are asked by a Tulare cotton grower who has a small quantity which it seems impossible to dispose of in the San Joaquin Valley at this time. These questions were referred to F. W. Waite, horticultural commissioner for Imperial County, who refers to the unfortunate situation which obtains with all growers of Egyptian cotton at this particular moment. However, here are a few points from Mr. Waite's letter:

"There is no cotton sold in the seed or seed cotton. Always sold in bales, lint separate from the seed. A bale is 500 pounds. The cost of ginning Egyptian cotton here is $16 per bale. There is no local market for Egyptian cotton. Sold on orders from the East, at the present time there is no demand due principally to readjustment of war conditions and labor trouble at the mills. As there are no buyers it is not possible to say what Egyptian cotton is worth, but it should sell around 53 cents per pound. It would not be advisable to ship seed cotton from the north to the Valley on account of the cost."

Grass Under Trees

I have a strip of land about 30 ft. by 1000 ft. lying east and west on the north side of a row of eucalyptus trees running in the same direction. This piece of land is pretty well shaded in the winter but in the summer more or less light fitlers through. I would like to know if there is not some forage or grass crop that would grow in this spot, sufficient for pasturage for horses or possibly that would produce a cutting or two of hay. This spot is at the lower end of an apricot and orange grove and is kept moist by the waste water from the orchards. The price of all kinds of feed is so high that it seems incumbent on one to utilize all the land to its fullest extent. Though I am not familiar with these different varieties, it seems to me that with the alfalfas, Sudan, Rhodes, Natal, Parra and other grasses, maizes and sorghums, there should be one or more suited for the conditions stated.—Subscriber, Cucamonga.

These questions were referred to Prof. P. B. Kennedy of the state university who answers:

"It is very difficult to secure any grass under eucalyptus trees. It is generally thought that the residue from the eucalyptus leaves is deleterious to vegetation. This, together with the shade, makes it a very difficult proposition and I am fairly cer-

As Distinctive as the White Triangle

Note the Way in Which Hudson Super-Six Owners Accelerate Their Cars

Is there any feeling quite as exhilarating to the motorist as that which comes to the driver of a car that is master of acceleration?

Note the way in which nearly all Hudson Super-Six drivers start their cars. They are off and down the road faster than any other driver. That is such a common performance that owners of other cars do not often dispute Super-Six right of way.

$2,200 f. o. b. Detroit for the 7-Passenger Phaeton

Such satisfaction is distinctive to Hudson.

But Hudson owners do not limit their praise to its superior acceleration. They tell how it grows in their affections because of its dependability. They enjoy its freedom and power.

Such confidence adds much to one's automobile satisfaction.

A Quality Not Revealed By the Specifications

More worth-while records than any other car has ever shown, give proof of Super-Six speed, acceleration and endurance. Official records mention the Super-Six again and again as holding the best time for this or that notable stock car event.

But words can not convey the feeling that one experiences when he is master of such a car.

Drive your Super-Six in a way that will give you its greatest motoring enjoyment. You can lead any procession of cars. You can dominate any road.

Production Limited Until June

Super-Six production will not be normal before June.

If you want a Super-Six phaeton—either four or seven passenger type—you may be able to find one at your dealer's. Some have a few in stock. When they are gone, all must wait until open car production is resumed.

HUDSON SUPER SIX

Hudson Motor Car Company

Detroit, Michigan

(1036)

tain that none of the grasses mentioned in the note which you sent me, namely alfalfa, Sudan, Rhodes, Natal, Parra, or the sorghums, would grow under the conditions mentioned. A grass that would withstand the shade conditions but perhaps not the deleterious effect of the eucalyptus leaves would be the Smilo grass."

Fair Play

If a wife buys a calf with money she washed for, has she a right to the increase? Has she a right to a cow that was given to her for a present? He says he owns all of the cattle we both worked for. He won't give me a cent of money and wants me to give him everything. If I don't want to live with him can I get any of the community property and land?—Subscriber.

That calf sure belongs to the woman, and the man who fails to provide for his family and does not permit a reasonable degree of liberty to others should move to Mexico or somewhere outside the boundaries of the United States. One-half of the community property belongs to the wife, or at least should if she is justly treated. The property may be divided if divorce is secured.

Repellent for Rabbits.

Can you furnish me with formula of the mixture used by some of the Fig Land Improving Companies on their young trees as a wash to keep off jack rabbits? This wash is quite effective in keeping off these rodents, and it would be valuable to your readers to know the formula employed.

We do not know the particular wash referred to, but common smears which have been used for this purpose consist of bacon grease or rubbing the tree trunk with bacon rind. Whitewash, to which has been added a mixture of glue and copperas, is also used as a protection. To a bucket of lime slacked with warm water add two pounds of dissolved glue and one pound of copperas dissolved in water. A combination of common potash and common grease is sometimes used, mixing it up like thick cream and painting it over the trunk. The use of the usual yucca or tule or any of the advertised tree protectors is perhaps the safest way of all, unless it is the construction of a thoroughly good fence.

Cheapest Silo

I would like to know the cheapest type of silo. I have heard there is one that can be built for one dollar per ton. What is the right size for 12 or 15 cows?—Subscriber, Porterville.

The cheapest silo is what is termed the pit silo. It is made by using the ordinary "scoop" scraper with team of horses. We cannot give exact cost per ton capacity, and, in fact, that cost would vary greatly according to circumstances, such as side hill site, nature of the soil and other factors. The more common pit silo, however, is the dupgout or cistern type. This form of silo is very cheaply constructed and filled, but greater care must be exercised in packing near sides. It is also more expensive in the removal of silage, and in this respect a windlass or other hoist with buckets or baskets is necessary. Perhaps the next cheapest silo is the wood hoop silo, described in Circular 173, Agricultural Experiment Station, University of California, Berkeley. This silo has been condemned by some, and by others urged as a step in the right direction for the farmer unable to put up a more permanent form of silo. Full information as to construction may be had in the circular, which is to be had for the asking at the university. Other information is in Circular 138, "The Silo in California," by Prof. Woll. There are different forms of stave silos, and they are being made today exceptionally effective and durable. Other forms are brick, hollow brick and reinforced concrete. Each cow will require one cubic foot or about 40 pounds, of silage per day, so if one wishes to cover a period of 180 days, it would take 7,200 pounds of silage per cow. It would probably not be wise to build a silo with a diameter less than 10 feet, though they have been built as small as six feet in diameter. A silo 10 feet in diameter and 20 feet in depth would have a capacity of 26 tons, or somewhat more than the amount which would be required for this small herd. However, this margin may be no greater than desired. Pit silos have been constructed at 40 cents per ton capacity. This is counting the cement and other supplies and not the labor, which was done by the regular men on the farm at odd times. Cost of constructing other forms would vary greatly.

Lippia Plants

Where may I secure plants or seeds of Lippia? I mean the plant which does so well along banks or terraces. —Subscriber, Santa Cruz.

Any of the plant and seed houses advertising in the Cultivator can supply these plants. They are usually delivered in flats and the sod is cut up into small squares, say about two inches, and set eight to twelve inches apart. The runners soon make the ground solid with this fine soil covering.

Bronze Turkeys

What is the weight of the largest Bronze turkeys?—Subscriber.

A writer in Races of Domestic Poultry says wild males have been shot which weighed up to 50 pounds, but these were very old birds. The largest we have seen among tame specimens was 47 pounds. This weight was secured under special feeding up plans. Averages would run probably less than half that weight.

IT HAS been stated by various authorities that one of the most important factors in crop production, in California, is nitrogen.

Assuming that nitrogen is the element needed, why should you use

Arcadian Sulphate of Ammonia

First: It is the least troublesome. You buy a definite compound, 25¼ per cent. ammonia, and you get it in good shape. It may be stored indefinitely without deterioration.

Second: It does the work. Results can be seen in the deep green color of an ordinary field crop in two weeks or less. As it is very high in ammonia, the freight and distribution costs are at a minimum.

And finally: It is made in the U. S. A., being produced on an increasing scale from our bituminous coal, and is an essential product of our great steel industry. It is an aid to the conservation of our natural resources. That is why we call it

UNIVERSAL BRAND

ORCHARD SPRAY

For dormant season spraying you want a good, general clean-up spray; a spray that will serve not alone as an insecticide—but will tone up and stimulate your fruit trees. For instance—

Crude Oil Emulsion

You can depend on this to control the scale insects. It penetrates the cracks in the bark and *kills the eggs*. So—what chance is there for Red Spiders, Aphids and their creepy brothers to do much damage?

Order your Universal Spray now—don't take any chances.

Among the other sprays we manufacture or distribute are:

Dormant Soluble Oil
Bordeaux Mixture
"Triumph" for Citrus Trees
Lime Sulphur Solution
Arsenate of Lead
Miscible Oil No. 1 for Olives
Miscible Oil No. 2 for Thrips

Whenever you have any questions to ask—write our Service Department, in charge of Paul R. Jones, Entomologist. This expert advice costs you nothing.

How the Credit Union Helps Farmers

By Geo. H. Dacy

Neither a borrower nor a lender be,
For loan oft loses both itself and friend.

WILLIAM SHAKESPEARE'S couplet may have been apropos during the age of ruffs, doublets and lace, but it is out of fashion now. Judicious, legitimate lending and borrowing are now primary principles of successful business. The game of keeping the dollars constantly in circulation has developed to such an extent that in many sections personal credit organizations have been promoted which cooperate with local banks in rural and urban financial affairs.

"There should be provided a system of personal credit unions, especially for the benefit of individuals whose financial circumstances and scale of operations make it difficult for them to secure accommodations through the ordinary channels," said David F. Houston, secretary of agriculture, not long ago. "Organized commercial banks make short term loans of a great aggregate volume to the farmers of the nation possessing the requisite individual credit. but there are many farmers who, because of their circumstances, are prevented from securing the accommodations they need. An investigation by the United States department of agriculture to determine the extent to which farmers in the Southern states were dependent upon credit obtained from merchants, revealed the fact that 60 per cent of them were operating under the 'advancing system.' The men I have especially in mind are those whose operations are on a small scale and who are not in most cases intimately in touch with banking machinery, who know too little about financial operations and whose cases usually do not receive the affirmative attention and sympathy of the banker. Such farmers would be much benefited by membership in cooperative credit associations or unions."

"What further can be done by the federal government directly to stimulate personal credit unions it is difficult to outline," continues Mr. Houston. "This matter has received consideration at the hands of many experts and was thoroughly canvassed by a joint committee of congress. The conclusion up to the present seems to be that the field is one primarily for the states to occupy through sound legislation. About 125 associations have been organized but the larger percentage of them have been formed by wage earners in urban centers. The attempt to develop strictly rural credit bodies has met with somewhat more success in North Carolina than elsewhere. In this state the work of promoting and supervising such organizations was placed in charge of an official in the division of markets and rural organization of the state college of agriculture. The law of this state was enacted in 1915 and at present 16 credit unions, all of them rural, are in operation. It is noteworthy that the North Carolina law makes special provision for educational and demonstrational activities."

Eight States Enact Credit Laws

Eight states, Massachusetts, New York, Texas, South Carolina, North Carolina, Wisconsin, Utah, and Oregon, has passed credit laws, while North Carolina now boasts 17 rural credit unions, five of which are especially prosperous and successful. Furthermore, in many urban sections of the New England states, personal credit unions have been established which have fostered saving among the laboring classes and their children. In Massachusetts, where the first of these clubs, the Myrick Union, was formed in 1908, there are 80 such clubs at present.

Under the German Raiffeisen system the credit union was a strictly cooperative association, conceived without capital stock, although ultimately the government required all such clubs to have capital stock. Under the Raiffeisen system these unlimited liability institutions make small loans at a low rate of interest for a designated purpose of worthy members of the society.

The capital stock company is the typical form of organization in the United States. For the association with share capital there is a limitation as to liability of the members, and this feature has been important in attracting members and capital. On the other hand, for those communities where share capital is not readily available, the non-stock association affords a means of obtaining funds on the basis of an unlimited liability.

Credit Union a Universal Depository

The credit union will accept deposits from anyone but it will lend money under restrictions only to its members. Funds are obtained by the credit association through share capital, by general deposits or by borrowing in the name of the association. Usually in the non-stock association a small membership fee is charged so as not to discourage membership. This furnishes funds for a small working capital.

In the share capital clubs each share sells for $5 to $10. Ordinarily there is no limitation on the purchase of shares unless this is controlled by state law or by-law of the association. No salaries are paid except a nominal one to the secretary treasurer who usually is a farmer or a business man having a connection with a local bank.

The success of the agricultural credit unions in North Carolina has been due largely to the fact that the state agricultural department has aided the movement by valuable educational work among the farmers for the encouragement of credit organizations. This assistance from the state is so invaluable that other states contemplating the promotion of rural credit clubs might well consider the practicability of a similar arrangement, in the opinion of the federal department of agriculture. The superintendent of credit unions in North Carolina assists groups of farmers interested in the credit union idea and advises with them not only in the formation of clubs but also in the efficient management of the organizations after they are formed.

North Carolina Has 17 Credit Clubs

The 17 credit unions of North Carolina up to December, 1918, had a total membership of 783 with 299 depositors who have made payments of $7977.27 on shares of stock. The deposits aggregate $14,175.25, and the loans to 144 borrowers total $17,778.76. Only $3200 had been borrowed from local banks while the cash in banks amounted to $7529.82. The total resources of the 17 cooperative credit clubs was $27,465.01 at the time mentioned.

The Vadese Union, organized February 10, 1917, has 80 members and 87 depositors who have made payment of $1746 on shares. The total deposits were $6655.08 in December, 1918, while 31 members had borrowed $6916.43. The club had $1429.78 in the bank and total resources of $8986.23. The Lowes Grove Union, the oldest in the state, organized January 20, 1916, had 55 members and 79 depositors in December, 1918. The paid-up shares amounted to $687.50; the deposits were $1159.78; the loans to 30 members aggregated $2326.46. From the local bank $600 had been borrowed while the cash in banks amounted to only $1.41 as compared with the total resources of $2632.29.

From one point of view the credit union really operates as a connecting link between the farmer and the banker and improves the farmers' chances of doing business with the bank. The credit union affords an excellent channel for farmers to get in intimate touch with their home bankers. The bankers as a rule appreciate that it is good business to aid the credit unions as ultimately the local bank benefits from the plan in the same way that savings accounts, usually dead losses at first, finally figure prominently in the net profits. The fundamental value of the credit union is that it encourages saving. It also enables farmers to negotiate better term loans and it encourages the practice of modern business methods in farming.

Bank Furnishes Credit Funds

Usually each credit union makes definite arrangements with some bank by which the latter acts as a depos-

50 FARMS at AUCTION

April 1, 1919, 10 A.M.

5-10-20-40-80 and 160 acre tracts

THE PRIEST RANCH adjoining the town of PIXLEY

Vineyard, Orchard, Alfalfa and General Farming Land

WATER CONDITIONS IDEAL

Title perfect and clear of encumbrance. Terms 10% cash and 10% annually until paid. Second payment on improved land due in four months. Payments may be deferred by purchaser making permanent improvements or setting out trees or vines.

Interest 6% payable annually. Discount of 2% per annum for cash at time of purchase.

Several tracts of alfalfa just ready to cut. Majority of land in grain which with seasonable weather will more than make first payment.

New $18,000 school house on land bought off this tract.

Power lines and several pumping plants already installed.

Large ranch house and two bungalows ready to move into.

Graded roads throughout the tract.

Pixley is on the main line of the Southern Pacific Railroad and on the STATE HIGHWAY. It is fifty miles north of Bakersfield, eighteen miles south of Tulare, and twenty miles south-west of Porterville. Take a look at the land before the day of sale.

Sale will positively take place and every piece be sold regardless of price, as indicated by the following resolution passed by the Board of Directors:

RESOLVED, that this corporation, Farm Lands Investment Company, do sell at public auction, without reservation, the tract of land adjoining Pixley on the east, and known as the Priest Ranch, and that the President and Secretary of this corporation be and they are hereby authorized, directed and empowered to sell said ranch at public auction on the first day of April 1919, and generally do all things necessary in the premises for and on behalf of this corporation. Read letters from successful farmers and land owners:

FRANK J. BRUNDAGE.

Farmersville, Calif., March 5th, 1919.

Mr. H. G. Cattell, Pixley, Calif.

My dear Sir:

The Priest Ranch, taking the tract as a whole, I think it one of the best pieces of land in Tulare County for home building and the raising of grain, alfalfa, deciduous fruits and grapes of all kinds; the soil being a deep sandy loam is easy worked at any time and being close to the main State Highway and railroad will make it very desirable for small farms. Anyone contemplating the purchase of land for a home or an investment will do well to investigate your tract before buying elsewhere.

Yours very truly,
(Signed) FRANK J. BRUNDAGE.

Dinuba, Calif., March 3rd, 1919.

Mr. H. G. Cattell, Pixley, Calif.

Dear Sir:

Regarding your land at Pixley, I can say that it is as good as the land at Dinuba. It is simply ideal for alfalfa, grapes, figs and peaches. While it is a pumping proposition, this is more than offset by entire lack of hardpan, uniformly level soil, and freedom from grasses, attending ditch irrigation.

Respectfully,
(Signed) G. W. WYLIE.

TULARE MERCANTILE COMPANY.

Tulare, Cal., March 5, 1919.

Mr. H. G. Cattell, Pixley, Calif.

Dear Sir:

I have been a resident of Tulare for the past twenty-eight years and have long advocated the breaking up of large holdings which in most cases comprise the most desirable lands in the community. This particularly applies to the Priest Ranch, which, I consider, offers exceptional opportunities for the home builder, situated as it is near the main line of the Southern Pacific and the State Highway, it is easily accessible. This is wonderfully fertile soil and will produce almost anything, with water, of which there is proven to be an abundance near the surface waiting for the pump. By seeding, cultivation and energy well directed, there is no reason why this should not be made one of the garden colonies of Tulare County.

Knowing the Priest land as I do, I shall not hesitate to recommend it to the home seeker as being particularly adapted to alfalfa and dairying. I do not believe better land for Thompson Seedless Grapes can be found in Tulare County and for fig culture, one only has to look to lands adjoining on the north to satisfy oneself of the practicability of raising this type of fruit.

Very truly yours,
(Signed) W. A. HIGGINS.

COUNTY ASSESSOR.

Tulare County, Cal.

Mr. H. G. Cattell, Pixley, Cal.

Dear Sir:

The Priest ranch has always been known and recommended as one of the best parcels of land in Tulare County. In looking over this land today I am impressed with what our land could be made to produce with the application of work, water and a little money.

I sincerely believe this land to be admirably adapted to the production of vines, alfalfa, peaches or figs. I believe this land to be just as well adapted to the production of Thompson seedless and Sultana grapes.

I should feel safe in recommending anyone contemplating making investments in this valley to make careful personal investigation of this tract of land. I feel sure that they will be profited by doing so.

Very truly yours,
(Signed) THOMAS H. BLAIR.

COPIES OF LETTERS FROM SUCCESSFUL LAND OWNERS.

Orosi, Calif., March 3, 1919.

Mr. H. G. Cattell, Pixley, Calif.

Dear Sir:

We have this day seen your land at Pixley that you propose to sell at auction.

We consider this land well adapted to alfalfa, vines and deciduous fruits and believe that anyone interested in land of this nature will find it well worth their while to investigate.

Yours very truly,
(Signed) V. E. SLOAN,
W. M. BEINHORN,
W. A. OXFORD,
R. H. ANDREWS.

Dinuba, Calif., March 5, 1919.

Mr. H. G. Cattell, Pixley, Calif.

Dear Sir:

On making a visit to your land southeast of Pixley I found it to be in my opinion better than the average of the land in the San Joaquin Valley.

I have lived in the valley more than 40 years and I think it is especially adapted to certain varieties of grapes, especially Emperors and seedless grapes, peaches and alfalfa, and although it is a pumping plant proposition there seems to be plenty of water. I see no reason why a man could not make a fine home there.

Respectfully,
(Signed) R. M. LEWIS.

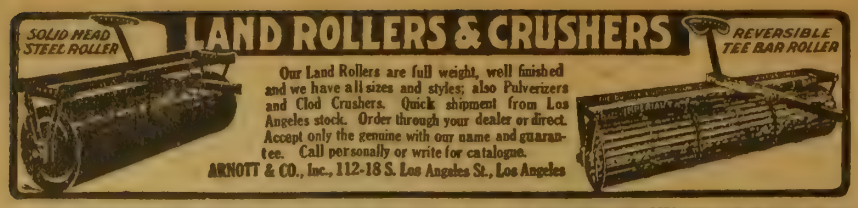
FIRST NATIONAL BANK.

Tulare, Calif., March 5, 1919.

Mr. H. G. Cattell, Pixley, Calif.

Dear Sir:

The writer has been acquainted with your large ranch south of Pixley, known as the Priest ranch, for the past 25 years, a wonderful two sections of the very best ground. I have no hesitancy in stating that it will make an ideal colonization for a large number of small farms, the soil is especially adapted for the small rancher in that he may produce successfully diversified crops. Soil, sunshine, and moisture are the essentials of production, you have good soil and warmth and with the moisture within reach through the medium of irrigation, the small farmer controls the situation. Intensified farming with fewer acres better farmed is now the watchword leading to success.



Wishing you every success, I am,
Very truly yours,
(Signed) H. M. SHREVE, President.

With the Return of
Peace and Prosperity
Plant
Teague Quality
Citrus Trees

With the present demand for food stuffs, the return of peace and normal economic conditions there will be a growing demand for all orchard crops and a corresponding larger demand for nursery trees. Already this return is finding expression in an increased demand for Teague Quality Citrus trees, which leads us to advise intending planters to book their orders early, as the available supply of really good, bud-selected (pedigreed) trees is rather limited. For this reason we invite correspondence. Prices cheerfully furnished.

The R. M. Teague Citrus Nurseries
San Dimas, California
FOUNDED IN 1889

itory and furnishes loans on specific terms. Thus one of the unions in North Carolina receives three per cent interest from its bank on deposits subject to check and four per cent on savings accounts left on deposit three months or longer. It pays five per cent interest on its loans from the bank. The credit union in turn pays its own members five per cent on their savings accounts and furnishes them loans at six per cent. Such a credit union not only accustoms its members to the use of check and savings accounts but also enables the members to obtain loans for approved productive purposes on better terms than they could obtain elsewhere.

In addition to handling deposits and floating loans, some of the North Carolina unions also aid their members in the purchase of cottonseed meal and corn or soy bean seed, the credit club buying in car lot quantities and thereby saving money for their members who otherwise would have to buy in small quantities at retail prices.

Loans for Productive Purposes Only

Any member who is industrious and pays his debts should be able to borrow from his credit union, provided his loan is to be used for productive purposes which will help pay the debt. The character of the borrower is prime security. Two indorsees are required to sign the note. This is regarded as extra security to safeguard the credit union.

During the first year of activities of a credit union the shorter term loans for four months or a year should be given preference to those for longer duration. The longer time credit can not be realized on while the shorter term loan can be renewed, if possible and desirable. The length of time for which a loan should be granted will depend upon its purpose and the system of farming practiced. It takes a farmer longer to gain full returns from a mule or plow than from seed or fertilizer. A dairy farmer might be able to pay off his indebtedness in from two to three months, while a cotton producer might require six to twelve months.

KEEP YOUR TRACTOR REPAIRED

Continued from Page 407

10, 20 and 30 cent corn and 40 and 50 cent wheat is only a few years removed. No doubt prices will be good for the coming season. Why not make the best of them? Delays cause decreased production and increased expense. The man that is best prepared to do his work when it should be done will raise the biggest crops and have the most cash to his credit when the harvest season is over.

"Go over each machine. Examine every part carefully for wear, loose joints, play in the rivets, bearings, bent or broken parts, loose bolts, etc. If adjustments can be made to take up the wear and put the part in good working condition, do it yourself. If it requires a new part or the services of a blacksmith to put the machine in working condition, take steps immediately to see that the necessary work is started. When there is a doubt as to whether a part will stand up for the following season, don't take a chance but get another part and have it on hand ready for an emergency. This applies especially to such small parts as sections, guards, ledger plates, etc., for your mowing machine and binder, bearings for your disk harrows, etc.

"It is well when ordering repairs to keep these points in mind. If at all possible, always get the number of the part. Order by number if you can by any means find the number. By using a little kerosene and scraping the part well, you can nearly always read the number. If you cannot make out the number and the letter that goes with it, or if the part is lost, describe it fully to your dealer, go over the repair book with him and pick out the part from the illustration. Where you can't make out the number, take the part with you to the dealer's place of business if possible. Don't forget to get the name and number of the machine; also, if possible, find out what year it was made. All of this information will help the dealer to order the proper repair parts for you.

"The disk harrow is one of the first machines that you will use in the spring, and it would be just as well to start with that as any of them if it is located in your shed so that you can get at it conveniently. Examine the hitch and frame, see that all the bolts and rivets are right, that there is no unnecessary play. Turn the harrow upside down and remove the bearing caps to see if the bearings are all right and clean out all the oil holes. If the scrapers are worn and cannot be made to do their work properly, new ones will be needed. Sharpen the disks. If you cannot do it yourself, see that they are taken to a competent shop or blacksmith where they can be properly sharpened.

"There is the peg-tooth harrow. No doubt you have seen men working with harrows where one-fourth to one-third of the teeth are worn away and yet they wonder why they are not doing as good work as their neighbors. Should you examine a harrow in this condition, you would probably find the corners of the teeth are worn off and no longer sharp and square. Sharpen the points of the peg-tooth harrow teeth and square up the corners. If any of the teeth have been lost, get new ones to replace them. Adjust the teeth to the same length. Tighten up the bolts. If the levers do not work properly, see that the necessary changes are made so that the harrow can be set to do its work well.

"There are the grain drills which should be inspected very carefully to see that all the parts are working properly, that none of them are broken or lost. Clean out the various seed cells, which will insure a proper amount of grain being delivered to the markers. Especially investigate the gears that drive the drill feed to see that they are not worn and that they will do their work in good shape.

"When it comes to mowers, other haying machines and binders, there are many things to investigate. Aside from the general points that apply to all machines such as those mentioned above, examine the cutter bar of the mower to see that the ledger plates are in first-class condition, not badly worn, and not too loose. Examine the guards. Some of them may be broken or bent or loose. See that the mower clips do their work properly in holding the knife down against the ledger plates. The knife may need new sections. Some of them may be loose or broken. Do not put off until you need the mower to get the knife in shape.

"Try the bolts that hold the cutter bar and the bolts that hold the outside shoe on the cutter bar. See that they are tight. Look at the knife head. See that it is not badly worn. Examine the bearing plates above and below the knife head. It is well to block up one wheel of the mower and have some one turn it slowly while you watch the knife to see that it is working properly, that the knife sections register at the center of each guard. If it doesn't register, change the drag bar or the push bar until it does. If there is wear on the pitman at either end and it cannot be taken up, take steps to get new parts. See that all oil holes are opened up; cleaned out. Also that the wooden parts are all sound.

"Aside from all these various things which apply to the machines, it might be well to inspect small equipment, such as singletrees, neckyokes, whiffletrees, hay rack, wagon boxes, etc. See that these are all in good shape. While you are doing this, it will not go amiss to examine your harness, halters, ropes, your hay rope. If it is broken or worn, see that it is spliced. You may need some new pulleys. All of these things if taken care of now will save time when time is scarce.

"The more expensive a machine is, the more important that it should be given good care and that it should be in first class repair when the time comes to use it. This applies especially to the farm tractor. If you are a good mechanic and can overhaul your tractor yourself, all well and good, but if not see that someone who understands your particular tractor goes over it with you. See that the bearings are properly adjusted, the valves ground, engine properly timed, oiler working right, magneto in first class condition, all bolts and rivets tight. No doubt the one most serious delay of delays is to delay getting your tractor in shape for the coming season's work. It supplies the power to pull or operate the other machines and without it your other machines will not be able to do their work. A few days spent on the tractor now will insure having your work done on time during the coming season."

SUMMER COVER CROP

Continued from Page 410

summer cover crop be planted early enough so that it forms a good green carpet by the time the trees are in bloom in April and for six weeks to two months thereafter. This can hardly be accomplished by the use of any of the bean or cowpea family except in seasons when for some reason or other the normal blooming period is delayed. More satisfactory crops for this purpose seem to be buckwheat, which can be planted early in March and makes a satisfactory growth by the time the trees come into bloom, and Melilotus alba or alfalfa, which may be planted either in the preceding fall or in very early spring. The writer knows of no good reason why Melilotus indica planted in January or February should not prove satisfactory for an early summer cover crop.

With a cover crop grown for prevention of the "June drop" especial emphasis should be laid upon the necessity of plenty of water. There must be no competition between the cover crop and trees. With buckwheat one may make out with as little as one-third to one-half additional water, but with the others mentioned considerable more may be needed. In some soils as much as three times the usual amount is necessary to insure success. Where water is expensive and scarce the summer cover crop may be an impossibility, but where water is plentiful and cheap it should at least be given a trial. The important points to bear in mind in planting a summer cover crop for the prevention of "June drop" are, first, to plant it early, and second, to irrigate it often. Of course, such a cover crop at the same time serves to add organic matter to the soil and should be turned under when its function is over, which is in July or August.

Practical Experiences

In discussing this subject in previous articles the writer has several times referred to an experimental plot of some 45 acres located near Bakersfield where last season the effect of summer cover crops in aiding in the set of fruit was tried out at the suggestion of Dr. J. Eliot Coit and the writer. Inasmuch as the results were so striking they are here given.

PLANTED TO SUMMER COVER CROP—SPRING 1918.

Lot.	Yield 1917 field boxes.	Yield 1918 field boxes.	Per cent increase.
2	173	667	285
17-18	781	1415	81
32	145	767	429
54	14	347	2378

CHECK PLOTS—NOT PLANTED TO SUMMER COVER CROPS AT ANY TIME.

31	89	104	16
15	375	257	32*

*Decrease.

The phenomenal increase to be noted in the case of lot 54 may be explained as due to two facts; one, this orchard is just reaching the bearing age, and, two, this lot composes a rather small acreage entirely isolated from the rest of the planting, and thus in the past subject to the desert environment in all its extremity, unmodified by the influence of adjacent plantings.

Lots 31 and 32 are of exactly the same area, the trees are of the same age, the contour of the land is similar, and the trees are comparable in every way.

As to the details regarding the management of the summer cover crop, I quote from a letter of J. E. Clarke, until lately in charge of the planting including the experimental plots: "Lot 54 was planted to vetch, 20 pounds, and Melilotus alba, 15 pounds to the acre, February 24, 1918, and was disked under in August. Lots 17 and 18 were sown to vetch 30 pounds and Melilotus alba 7 pounds per acre as was also lot 32. Lot 2 had a cover crop of vetch and weeds which were disked under about June 30. This year we are planning to plant the whole acreage to cowpeas and Melilotus alba which I feel will be better than last year's combination. The vetch ripens as soon as the weather gets warm and also requires more water than the cowpeas. Last year we used about a miner's inch of water to five acres of orchard twice a month, using a stream of water on each furrow for about eight hours each irrigation. The vetch was drilled in the orchard, then furrowed out with six furrows to a middle and the Melilotus alba then sown broadcast by hand. The average yield is no better than last year except in the plots planted to a summer cover crop."

Other growers who have reported increases in yield following the use of the summer cover crop include W. Phillip Smith of Plano, Tulare County, and H. E. Howard of San Dimas, who use buckwheat, and C. W. Kellogg of Bakersfield, who uses alfalfa as a cover crop.

During periods of extreme heat such as occurred in June, 1917, any covering which protected the soil, either mulch or cover crop, of course aided in holding the fruit provided the soil moisture was sufficient. The summer cover crop, however, bids fair to accomplish much to aid in setting large crops in sections where annually the June drop is so severe as to almost make the growing of navel oranges unprofitable.

FIG GROWERS INCORPORATE

The newly organized Fig Growers Association has taken steps to legally incorporate. The new association will interest itself chiefly in marketing problems.

SPANISH OLIVE OIL COMING

Spanish olive oil is being received in New York, wholesaling at $2.60 to $2.90 per gallon.

What would we do without parents?

HEREDITY is always a big factor—in seeds as in everything else. Before you can expect healthy, vigorous *offspring*—you must have healthy vigorous *parents*.

Applied to seeds, this means that they must be of proven vitality and proven quality. Yes—pedigreed!

Morse's Seeds *are* pedigreed. For 45 years our seed experts have been choosing for seed production vigorous, healthy parent-plants and have been breeding them scientifically, generation after generation. Accurate records have been kept of this plant breeding and the ancestry—the pedigree—of whatever seed you buy from Morse is clearly and definitely established.

That's why you can be sure of getting in the product of any variety of Morse's Seeds all its particular good quality traits.

And, in addition to being pedigreed, Morse's Seeds are soil-tested to prove germination power and vitality. They are cleaned and re-cleaned. *They are better seeds than even the pure seed laws require.*

You can buy Morse's Seeds in whatever quantity you need—by the 7½ cent packet, the pound, or the ton. You are going to need seeds this year. Write or wire today for quotations in quantity lots.

PURE BRED REGIST'D HOLSTEINS

Tuberculin Tested State Supervision Production Butter Fat Everything Guaranteed

INTENSELY INBRED

Not in blood but in lines of production.

These two heifers consigned to the Guarantee Sale show the work of a half score of the foremost breeders of the world, so we are not selling them to please ourselves or benefit our herd, but with the belief that to plant the best seed will return the greater harvest.

Buyers at this sale should carefully consider the merit of the great young heifers we will offer:

No. 1—NATOMA ALCARTRA, sired by King Morco Alcartra, the forty pound son of the only "Tilly Alcartra", the greatest dairy cow of all breeds in the world. For eight generations she has the most uniform lot of producing dams possible to produce. Her first dam, a junior three year old with 22.92 pounds in seven days, is by our senior herd sire, King Korndyke Pontiac (shown below) and we believe she will make over thirty pounds at next freshening. The calf that she carries, sired by Prince Gelsche Walker Korndyke (shown above), should be worth a lot of money aside from the value of the heifer herself. Consider these points, Mr. Buyer, when this heifer is led into the sale ring. If you don't take her home with you then be in line to congratulate the plucky buyer that gets the heifer; she is a gold nugget among Holsteins.

No. 2—DAME PRILLY WALKER is a daughter of the 22.6 pound four year old Princess Cleaveland Hengerveld, still in the herd and capable of a much larger record. She is sired by Admiral Prilly Walker and is in calf to Sir Aaggie De Kol Acme, whose dam has the highest official yearly butter record of any cow in the world. She is a show heifer and bred in the purple.

Remember Jane Garden Farm guarantee for satisfaction to purchaser is back of these heifers.

W. F. Mitchell, Owner Visalia, Cal.

Dairyman's Big Opportunity

By R. P. Royce

FROM every section of the state comes the report that good grade dairy cows are in demand at prices that are higher than ever known. Apparently, dairymen who sold off their cows during the winter of 1918, either because of high feed costs, a shortage of labor or because they figured that cow values were at the peak, are now in a mad scramble to get back in the business.

There are several interesting morals to be developed from the present situation. In the first place the present condition might have been rather accurately forecasted at the time liquidation of dairy herds was at its height, and the men who were in a position to hold their herds, and who did hold, are the ones who are now making the money. It is the in-and-outer who nine times out of ten holds the sack. Occasionally one can sell at the high point and buy at the low, but the few times one does are so few as to not figure very importantly. It was ever thus. It has been true in the beef business, particularly true in the sheep business, it has worked out in the horse business (and if we are not mistaken it is certain to work out again). It has not been so pronounced in the swine business owing to the fact that hogs can be liquidated and rapidly reinstated.

This fundamental fact should always be kept in mind by live stock producers: Whenever a marked liquidation occurs it is certain to produce a shortage and a shortage makes for high prices, and the man who holds on when others sell is bound to profit—and to an extent that will usually wipe out any losses he might have experienced while sticking to his guns.

Another fact that the live stock man must come to appreciate is this: When a critical situation developes—when because of some economic reason profits decline—even to the vanishing point—the man who can stick the longest and thus weather the storm is the man who has developed his herd to a higher point of efficiency than his neighbors.

Efficiency can be developed to a high degree with any class of live stock—particularly is the dairy producing business capable of responding to efficient methods.

Well bred bulls; careful testing; keeping records of feed and production; culling out inferior animals; and organization for the distribution of milk and milk products, are certain to produce efficient and profitable results.

Another point that needs to be driven home to a lot of dairymen in this state is the fact that grade cows that are bringing the high dollar are invariably cows showing good breeding. We recently watched a sale of grade cows. Some sold as low as $100; the majority from $135 to $150, and a few as high as $210. In every case the range of values was based on evidence of better breeding. And during the sale the seller remarked that he would prefer the $200 cows to the cheaper ones, stating that he knew they would prove more profitable.

What was the value of the bull that sired the $200 cows compared to the sire of the $100 or the $150 cows—granting that the higher priced cows probably had better dams than the cheaper stuff? Could his value be accurately stated? Is it reasonable to suppose that he cost more than he was worth? We think not.

What made the one bull more valuable than the other? An accident? Because he was well bred—better bred; because back of him were the accumulated qualities of a long line of carefully selected dams and sires (note we place the dam before the sire). That, rather roughly put, is the reason for pure bred live stock. The various breeds of pure bred live stock do not exist for any reason other than that they have demonstrated to practical men that they are the most profitable kinds of livestock.

The very fact that dairymen who sold their herds a little over a year ago find that now when they are trying to reestablish their herds they are forced to pay much higher prices (to the men who could hold their herds because of greater efficiency) and that they are paying more for the better bred sorts, is the strongest argument why they should take to heart the lesson made so plain, and why they should resolve, now that they are back in the game, to place their herds on a higher basis of efficiency than they operated on before they were forced to sell.

Perhaps there will come a time in the future when marked liquidation of dairy herds will be necessary. When that time arrives will you be in a position to hold, knowing that following liquidation high prices will prevail?

Sir Aaggie Walker

Son of the 34 pound junior four year old Lady Hiske Walker and by Sir Aaggie De Kol Acme. Consigned by A. W. Morris & Sons.

One of the surest ways of placing your herd on a more profitable basis is through the use of well bred bulls—as well bred bulls as you can possibly afford to buy. There is no mysterious art connected with the grading up of a herd of dairy cattle. Good bulls and common sense are really the chief factors back of most dairy successes.

Now is the time to start. Begin with a well bred bull and each time it is necessary to replace him make every effort to get a better bull. If you are not in a position to buy a few pure bred cows, plan to buy at least one. Build your herd around pure bred bulls. You will find them more profitable than ordinary cows and when a time comes when the man with poorly bred cows is forced to sell you can hold your herd. Again, if you should decide to sell out your herd you will find that the kind of cows the public wants, and is always willing to pay for, is the better bred kind.

During the next few weeks dairymen of this state will have several opportunities to make unusual selections of well bred cattle. Some of the cattle to be offered for sale represent most unusual opportunities. They will sell—will sell well—and the men who secure them will be the men who look the farthest ahead.

ALFALFA GROWERS AT BISHOP

The Alfalfa Growers of Bishop district met and selected C. E. Trowbridge, J. L. Gish, Chas. Partridge as an advisory committee in this district to work in connection with the Alfalfa Growers of California, Inc.

This committee will look after the interests of the association in the Bishop and Laws section.

The soilcitation for members was started in this section by J. L. Farrar, field manager of the association, a few days ago. He reports a membership of 20 in this section.

"GOLDEN STATE SWISS CHEESE" A NEW CALIFORNIA PRODUCT

By J. A. Robson

THE manufacture of Swiss cheese, undertaken less than a year ago by the California Central Creameries in Humboldt County, has now progressed into a commercial enterprise of a magnitude sufficient to hold its own in markets once again thrown open to the imported article. The new plant of the California Central Creameries at Arcata is now turning out an average of 1500 pounds of this cheese daily, the total output to date being in excess of 100,000 pounds.

Many unsuccessful attempts to manufacture Swiss cheese were made by various creamery establishments when the war cut down the imports. This was partially due to method of manufacture and partially to the lack of the proper equipment. The plant in Arcata was opened the latter part of last June by the California Central Creameries and is provided with the most up-to-date machinery and other equipment that the market affords or that money can buy. Having mastered the secret of Swiss cheese making the specially installed apparatus made it possible for the new plant to turn out a product that experts declare is indistinguishable from the old world article.

"Golden State Swiss Cheese," as the new product is called, is manufactured under the watchful eye of a cheese expert formerly in the employ of the United States government. The secret process by which the cheese becomes "Swiss" rather than some other brand is the foundation on which a highly desirable new variety of American cheese is being produced.

Each cheese weighs approximately 150 pounds and requires about three hours in the actual making, followed by a long period during which it passes through the various curing processes. It requires considerable hand labor, although every mechanical contrivance that will aid in the work is installed at the Arcata plant. From the receiving vats the milk passes through conductors to five copper kettles, each having a capacity of 1600 pounds. A man is stationed at each kettle to keep the milk moving about by the constant use of a paddle. When this operation has progressed to just the right stage the curd is dipped out and hooped.

When ready for curing the cheese are stored in a room equipped with shelving. Here 600, measuring nearly a yard in diameter, can be seen at one time. The temperature of the room is kept down by refrigerator pipes running along the walls and ceiling. When the green cheese have reached a certain stage of ripeness they are moved into a second curing room where the temperature is held by steam. Two expert cheese makers from the old country work constantly in this room, daily turning each of the huge cakes and treating it to a brine solution used in the curing and finishing process.

When ready for shipment the cheese are packed four in a tub, especially constructed for that purpose and an exact replica used for the imported article. The tubs are then rolled to the rear of the building and into the waiting box cars. A full carload of 219 cheese was shipped to New York in December at a valuation of something in excess of $18,000. Most of the output of the plant has been shipped to the east, although local merchants have been provided with sufficient to supply their trade.

SEATTLE, WASH.

Announces the Consignment of the following Animals to the California Holstein Breeders' Guaranty Sale:

"Jot" Down these numbers—
Read further details in Catalog

No. 17—Ruby Pietertje of Forrest Hill, 2d—having a record of 27.77 at three years and a half; an almost sure 30-pound prospect; good size and will weigh over 1500 pounds. Bred February 6th to Carnation King Sylvia, the $106,000 reference sire No. A.

No. 18—Carnation Skylark Segis—a daughter of a grandson of King Segis. She is a show heifer, winning First in North Pacific Coast shows, and Fourth at the National Dairy Show. Bred to Matador Segis Walker, reference sire No. B.

No. 19—Gerben Colantha Parthenea—her sire is a son of Colantha Johanna Lad, and a grandson of Hengerveld De Kol, now on test. Will be bred to Carnation King Sylvia, reference sire No. A.

No. 20—Carnation Segis De Kol, a daughter of Johanna McKinley Segis, the 40-pound son of King Segis, out of the 40-pound Johanna De Kol Van Beers. Her dam and granddam are both sired by a son of King Segis.

No. 21—Segis Johanna Walker—
Another promising daughter of that great transmitting sire, Johanna McKinley Segis.
Her dam has a 23-pound butter record as a two-year-old, and is a granddaughter of the famous King Segis.
Will be bred to Carnation King Sylvia, reference sire No. A.

No. 22—Carnation Rag Apple De Kol—
A heifer with wonderful backing, her grandsires being the world's famous bulls, Rag Apple Korndyke 8th, and Johanna McKinley Segis, a combination very hard to equal—one that cannot be beaten. Will be bred to Matador Segis Walker, reference sire No. B.

No. 23—Carnation Segis Colantha—
She is a show heifer in every sense of the word, with wonderful good backing, sired by a son of Colantha Johanna Lad, and grandson of Hengerveld De Kol.
She is from a 21-pound three-year-old granddaughter of King Segis. With the backing of these three great sires and their pedigrees, and being bred on January 23, 1919, to Carnation King Sylvia, should command attention of every breeder looking for "bred in the purple" material.

REMEMBER—All animals on Carnation Stock Farms are under Federal test by U.S. Bureau of Animal Industry.

Read through the catalogs and see the reference made to the following herd sires owned by Carnation Stock Farms:

Matador Segis Walker, a grandson of King Segis.

Johanna McKinley Segis and King Segis 10th, sons of the famous King Segis.

Beauty Piertertje Prince, with 37 A. R. O. daughters.

Dutchland Governor Sir Colantha, son of Colantha Johanna Lad.

Young bulls from good A. R. O. cows for sale at our Farms.

For listings, pedigrees, etc., write us at 1077 Stuart Building, Seattle, Washington.

The Home of the $106,000 Holstein Bull

Reference Sire No. "A"

Carnation King Sylvia is the son of May Echo Sylvia, who holds all the world's milk records on production from one to one hundred days—considered the best cow of the breed. Carnation King Sylvia will be given a wonderful opportunity in the Carnation herd, the largest registered Holstein herd in North America. Above photo taken at 6 months.

A Great Herd Bull

Guaranty Sale, March 27, 1919

HIS SIRE'S DAM
Aaggie Acme of Riverside 2d
Butter— 7 Days..... 35.38
Butter— 30 Days..... 142.32
Butter—365 Days.....1331.78
World's Strictly Official Record.
Highest daughter of King Mead of Riverside.

HIS DAM
Lady Hiske Walker
Butter— 7 Days..... 34.25
Butter—30 days.....123.53
365 Days (2 yrs.).....654.58
State Record when made.
Second highest daughter of Prince Gelsche Walker.

Do You Want a Bull on Which You Can Stake the Future of Your Herd?
If so this one merits your attention

REMEMBER—

THAT HIS TYPE, his breeding and the records back of him are about as near right as you will ever find in one animal.

THAT THE AVERAGE RECORD of his three nearest dams is higher than any other bull in the sale, as is also the average of his seven nearest dams.

THAT THIS IS THE ONLY YEARLY RECORD BULL IN THE SALE and that it is going to be to your advantage to own a yearly record sire. That his dam is due for another large yearly record at next calving.

THAT HIS DAM AND SIRE'S DAM are by two of the greatest proven sires of the Holstein breed, each having sired a world record daughter.

THAT HIS SIRE is heading two of California's largest herds and is destined to high rank among western sires.

THAT HIS DAM is three quarter sister to the 36 pound junior three year old Miss Valley Mead De Kol Walker, the highest living junior three year old and the dam of the $6500.00 bull, King Korndyke Pontiac 20th, and that you can not go wrong in selecting a sire bred in these popular lines and especially when backed by such outstanding type and production.

THAT WE ARE ALSO CONSIGNING three beautiful daughters of Prince Gelsche Walker, two of which are from 31 and 32 pound dams. A 32 pound junior four year old granddaughter of Hengerveld De Kol that has milked over 100 pounds a day with second calf. Best of all they are bred to the highest yearly record bull in the world, SIR AAGGIE MEAD DE KOL.

A. W. Morris & Sons Corp.

Woodland, Cal.

60 Registered Holsteins at Public Auction

Thursday, April 3 Visalia, Cal.

This sale includes every cow of milking age, some bred heifers, a few unbred heifers, and some choice young bulls, in the herd at

Packwood Farm, owned by W. F. Mitchell

This well known herd is one of the pioneer Holstein breeding herds of the lower San Joaquin Valley, and has enjoyed an excellent reputation as to breeding, production, and cleanliness. Mr. Mitchell is not retiring from the breeding business, but will take a little breathing spell while the splendid young daughters of Prince Hiske Walker are growing up, all of which now in the herd will be retained.

THERE ARE 14 COWS AND HEIFERS IN THIS SALE WITH RECORDS UP TO OVER 31 POUNDS BUTTER IN 7 DAYS.

A DAUGHTER OF SPRING FARM KING PONTIAC 6TH IS ONE OF THE GREATEST PROSPECTS EVER SOLD IN THE WEST.

39 COWS AND HEIFERS IN THE SALE ARE BRED TO PRINCE HISKE WALKER. FIRST CLASS FOUNDATION FEMALES.

PRINCE HISKE WALKER will be sold for the sole reason that only his daughters will be left in the herd. We consider this young sire without question one of the most attractive herd sire propositions in California. He is only just past 4 years of age, and is practically certain to have no less than 60 living daughters before he is 5 years old. Give this bull your earnest attention as to breeding, individuality, and the high excellence of his offspring which you will have an opportunity to see on sale day. He is a full brother to the 34 pound junior 4 year old, Lady Hiske Walker, and combines some of the richest and most popular blood lines to be found in the West.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

NOTE—Packwood Farm is about seven miles north of Tulare just off the main State Highway.

Hollywood Farm Holsteins

Hollywood Farm, Hollywood, Washington, spectacularly known as the home of the $18,000 42-pound two-year-old heifer, Glen Alex Queen De Kol, is nevertheless more justly entitled to fame because of the substantial breeding and production present throughout the entire herd, a characteristic that is the direct result of the foresight of the owner, Mr. F. S. Stimson, in centralizing strongly upon the blood of King Segis some years ago even before the blood of that great sire had demonstrated as fully its unexcelled power of production as it has up to this day.

The first step in the King Segis direction was made not long after the founding of the herd when King Palmyra Fayne, by King Fayne Segis, sire of the only 50-pound cow, was placed at the head of the herd. The dam of this great sire is Bloomingdale Hengerveld Palmyra, a 30-pound daughter of Hengerveld De Kol. This bull met with an early death, but still has about 30 daughters at Hollywood with records up to over 32 pounds butter in seven days.

King Palmyra Fayne was succeeded by his son, Hollywood Lilith Palmyra, out of the 32.47-pound cow, Lilith Queen Pauline, who also made 26,135.9 pounds milk and 1077.21 pounds butter in one year. This bull also was destined to die young, but he left behind him about 50 splendid daughters at Hollywood, one of which has made 33.44 pounds of butter in seven days as a junior three-year-old, and the entire list is most promising.

Then came what was unquestionably the most important addition to Hollywood herd up to the present time, the purchase of the famous Judge Segis, proven son of King Segis. He has now 30 A. R. O. daughters, the first one tested above heifer age having made over 37 pounds of butter in seven days.

Judge Segis is a commanding individual in addition to his rich breeding, and the promise of his young daughters now at Hollywood is extremely bright. He is being given very heavy service and his chances are most excellent to become the first century sire developed on the Pacific coast.

Sanitation has always played a leading role in the development of the Holstein herd at Hollywood, the herd having been tested regularly for tuberculosis almost from its beginning, and for the past two years it has been under federal inspection and test.

Many outstanding producers have been developed in the herd, including cows with seven-day records above 38 pounds and yearly records above 1100 pounds butter, and there are some splendid daughters of these great producers in the herd at the present time.

A detail of the many desirable individuals in the herd would make a story longer than present space permits, but mention must certainly be made of a young daugther of the 42-pound $18,000 two-year-old Glen Alex De Kol, by Judge Segis. She is truly one of the most remarkable heifer calves of the breed.

The Cows Are Coming Home

Certified milk is manufactured in the clean, wholesome and picturesque conditions at Hollywood Farm.

Holsteins at Carnation Stock Farm

Men who have to do in a large way with the economic problems of our country, food production and distribution, banking, not only as directly applied to agriculture but to general business as well as some of the fore-

Contented Cows

On the Carnation Farms. High breeding, rich feed, large production.

most public institutions, have been inevitably drawn to the Holstein cow because of the tremendous part she has played and is now playing in the economy of our daily life.

One of the most conspicuous among men of large affairs who have taken up the breeding of registered Holsteins is Mr. E. A. Stuart, president of Carnation Milk Products Company, Seattle, Washington, whose company manufactures and markets the famous milk "From contented cows."

Carnation Stock Farms, as Mr. Stuart has named his two big breeding establishments, one at Seattle, the other at Oconomowoc, Wisconsin, are populated today by two of the largest and in some respects most extraordinary herds of registered Holsteins in America.

It is of the western farm at Seattle, however, that the present item will deal, as this herd is certain to play a most important part in the progress of the breed on the Pacific Coast, and its development during the past four years has been nothing short of phenomenal, and it may be said right here that Mr. Stuart himself is the man to whom the credit is due, having fared rather better in developing this great herd according to his own personal ideas and judgment.

In the original foundation of the herd females were acquired by purchase from many sources, and particular attention was given to the selection of herd sires. Two sons of the great King Segis were used in the herd, one of them the famous 40-pound bull Johanna McKinley Segis, the other the younger sire King Segis 10th. Following these came Dutchland Governor Sir Colantha, a good son of Colantha Johanna Lad, and Matador Segis Walker, a son of King Segis 10th.

The herd now contains a considerable number of daughters of these four sires, and it is from among them that some of the big developments in the herd may be expected from now on.

Of Matador Segis Walker it is due him to say something in detail as to his breeding, his past accomplishments, and the future promise of his offspring. This splendid young sire is now only just past five years old and only a few of his daughters have yet reached milking age, but they are making splendid records as they come along. As stated before, this outstanding young sire is by King Segis 10th and is out of Matador Twisk Minette 4th, who made 33.54 pounds butter from 617.9 pounds milk in seven days as a four year old, and she is sired by the great transmitting bull Artis De Kol Walker.

Matador Segis Walker now has seven A. R. O. daughters, one of them Matador Hengerveld Bess, having made 40.24 pounds butter in seven days as a senior three-year-old, and another, Matador Segis Pauline Jennie, made 29.64 pounds butter in seven days also as a senior three-year-old, under most trying conditions. There are at present about eighty daughters of Matador Segis Walker in the Carnation herd, and they are unquestionably one of the most promising groups of daughters of one sire in America, possessing a rare uniformity of size, depth of body, capacity of udder, and pleasing type.

But the most sensational and farsighted act ever executed by any breeder was accomplished by Mr. Stuart when in a public auction sale at Milwaukee last year he paid $106,000 for the bull calf now world famous as Carnation King Sylvia. The breeding of this bull is too well known to require repetition here, but a study of his pedigree shows an unequalled production of milk and butter through his dam, May Echo Sylvia, the only cow that has made over 1000 pounds milk in seven days under official test, and her record of 41.01 pounds butter in seven days stamps her also as one of the greatest butter producers of the breed.

Carnation King Sylvia has now reached breeding age and is being used on the daughters of Matador Segis Walker, as well as on the group of high record cows that are now at home at Carnation farm, and the demand for his sons has begun even before one has been born.

Of the high record females at Carnation a story by itself might be written, but an impressive fact noted in a survey of the group is that there are seven three and four-year-olds in the herd with records from 30 to over 37 pounds butter in seven days, to say nothing of the 29 pound heifers, or that great yearly producer Forward Somerset Duchess that made 28,540.1 pounds milk and 1,018.83 pounds butter in one year as a four-year-old.

Which reminds us of the fact that yearly records, or more particularly 305 day records, are going to play a large part in this herd, some good ones now being under way. The writer gathers that a 305 day record and a living calf each year is the program laid out for the females at Carnation Stock Farm, a plan that may well engage the attention of other Holstein breeders.

In this brief sketch only the barest outline has been given of the intensely interesting makeup of this great herd, nor has any mention been made of the thoroughly practical buildings, or the broad fertile meadow lands that are a part of the equipment. Neither has mention been made of the fact that the entire herd is under federal inspection for tuberculosis, and that the entire herd of 350 head was tested a short time ago without a single reaction. Each of these features contains a story all by itself.

DUROC BREEDERS TO MEET AT DAVIS

F. M. Johnson, president of the Western Duroc-Jersey Association, has issued a call for a meeting of the association to be held at the University Farm, Davis, probably April 11, during the big Live Stock Week scheduled for April 7-12.

During the meeting plans for promoting and insuring the futurity to be held at the state fair, and for the sale that may be held at the same time, will be discussed.

Duroc breeders will be interested to know that Fred De Vore, one of the best known Duroc men of the Middle West, is expected to visit California herds during the last week in March and the first of April. De Vore is expected to attend the meeting and the banquet which will be held at the Travelers Hotel in Sacramento, following the meeting.

One of the features of the meeting will be the showing of moving pictures made in famous Eastern Duroc herds. The pictures are intended to illustrate the modern type of Duroc.

The Guaranty Sale

State Fair Grounds Sacramento, Cal.

Thursday, March 27, 1919

We have already told you in previous announcements something about the great individuals in this sale, featuring the highest record bull ever sold on the Pacific Coast, the highest record cow, the highest record heifer, the 30 daughters and sons of 30 to 41 pound dams, the 40 daughters and sons of 30 to 40 pound sires.

NOW CONSIDER THIS ALSO—

that every one of the eight cows and heifers in this sale with official records of from 30 to 37 pounds butter in 7 days MADE HER BEST RECORD AT LAST FRESHENING, proof positive that the breeders are selling 30 pound cows that may be expected to still further increase their records as they are still young. We doubt if this could be said of any other sale ever held that contained a like number of 30 pound cows.

AND THIS—

that the wonderful females in this sale are bred to eighteen of the very best bulls on the Pacific Coast, a number of them outranking any other bull in the world in various respects. Their calves from the great females to be sold will be worth a fortune.

AND THIS—

that every single animal in this sale, no matter how high a valuation upon it exists in the mind of the owner, is pledged to absolute sale without reserve or limit, assuring the buyer that he can buy any or every animal in this sale in open, above board, bona fide bidding.

AND THIS—

that buyers of real herd heading bulls will have an opportunity to select from among six extra choice ones in this sale, every one out of a 30 to 41 pound dam, every one by a 30 to 37 pound sire, several backed by long distance blood of the first quality in addition to their splendid short time record backing.

AND THIS—

that every one connected with this sale cordially invites you to be present, regardless of whether you make a single bid or not. It is a liberal education in Holstein breeding and excellence just to see such a wonderful collection of great black and whites, and every courtesy will be extended to you if you come simply seeking information.

HERE SHE IS!

Ava Model Hengerveld 2nd

And when you see her you will realize that the above reproduction falls far short of doing her justice.

She, her daughter, her granddaughter, and her half sister by the same sire, are in our contribution to the Guaranty Sale, Sacramento, March 27, and we believe that no more desirable family group has ever been led into a Western sale ring.

This great producer and reproducer is only seven years old, is by a good son of Colantha Johanna Lad, has over 30 pounds butter from over 700 pounds milk in seven days, record made at last freshening, made 971 pounds butter last year and promises to make over 1000 pounds this year, and is the dam of the first prize 3 year old at National Dairy Show last year who made over 30 pounds butter in seven days as a junior 4 year old after coming off the show circuit. The full sister to this 30 pound 4 year old, and the daughter of this 30 pound four year old are in this consignment. The cow herself is well along with calf to Judge Segis and both heifers are due to drop their first calves in April to a son of a 31 pound 2 year old.

Others of our consignment to this great sale are a great 27 pound cow now milking over 90 pounds per day on semi-official test, and she is bred to the $106,000.00 bull Carnation King Sylvia; a senior 4 year old that has over 22,000 pounds milk and over 800 pounds butter in 305 days on semi-official test; and a good record young show cow out of a 26 pound dam.

Our cattle will be on the sale grounds, State Fair Grounds, Sacramento, no later than March 24, and you are cordially invited to come and look them over before the sale.

Our Herd is Under Federal Test

Milky-Way Farm

Dispersal Sale

45 Registered Holstein Cows, Heifers and Bulls
45 High Grade Holstein Cows and Heifers

Wednesday, April 2, 1919
E. R. Putz Ranch, Near Laton, California

Mr. Putz is retiring from the breeding and dairy business and has instructed us to conduct a complete dispersal sale of his well known herd of profitable producers.

While no official testing has been done in the herd, the blood lines are substantial, representing some of the most popular lines of the breed, and the cattle are practically all young, clean, and good producers. This herd contains

24 Greatgranddaughters of Pontiac Korndyke
3 Daughters of Arcady Pontiac Wayne Hengerveld
3 Daughters of Prince Beauty Pieterje Segis

Besides the desirable young cows and bred heifers in the herd, there is a very desirable lot of unbred heifers and heifer calves that will grow into money fast for someone. Dairymen will also find some choice young bulls in this sale, although there are only a few bulls from this herd have been in strong demand and few have stayed in the herd long enough to reach service age.

The Grade Cows and Heifers

are a well marked lot, young, clean, good producers, and all that are bred are in calf to a grandson of Pontiac Korndyke, the present herd sire. Here is an opportunity to buy some grade Holsteins of high quality.

Prince Lunde Korndyke 2nd

the herd sire will be sold. He is a grandson of Pontiac Korndyke and is a fine individual. See this bull and then look over his calves in the herd and you will find that he is getting some exceptionally promising heifers.

Every animal in the sale over six months of age, both purebreds and grades, is tuberculin tested and sold subject to retest by the buyer.

THE FARM is nine miles north of Hanford on paved County Highway; three and one-half miles east of Laton; ten miles west of Kingsburg.

STRAY THOUGHTS OF A STOCKMAN

By A. A. Spellmeyer

THERE appears to be a tendency to encourage production and the decade old packer policy seems to be changing in spots, but the producer who has faced drouth, loss and hardship in the past two years in this Southwest, with spring prices held down on account of money conditions, is from Missouri.

The cattle loan companies in which packers and directors are putting forth a laudable effort to make cattle paper a recognized collateral on this coast, are stating many true facts regarding the safety and desirable character of cattle loans.

In the Pacific Coast Banker the Swift valuation of livestock in this country is said to be forty-nine billion dollars. Other comments in the same issue from a San Francisco banker bring cow men the glad tidings that at least one banker has looked into cattle loans and finds them savory.

The Northwest is about 600,000 cattle short. The western part of Texas short, and fully 200,000 needed in California. There are apparently about 300,000 to 400,000 available cattle to be had for spring delivery in the Southwest. Figuring in Kansas and other Middle Western states, as well as the Northwest, there will be a demand three times as strong as the supply. Something is bound to break loose before long, but the longer the delay the cheaper the price, until the spring rush will start, and this will not start in earnest until the northern men figure their profit and loss on account of storm loss and until all buyers can get money. Men cannot buy, however, without money, and most men will have to borrow it.

Steer prices and beef prices seem to have nothing to do with present yearling prices. With ten cent feeder, twos and threes yearlings are held from $35 to $45 in the West and from $48 to $50 in the Panhandle. Some small lots are held lower. One man I know is asking $32 for a better bunch of heifers than another a hundred miles distant is holding at $42. Few spring contracts have been closed, and if producers do not get an advance over last year's prices they will alone be to blame on account of the frigid condition of their pedal extremities.

Cows generally have advanced more in proportion than any other grade of stock. Two years ago $65 was a big price for a cow and calf, from herds selling yearlings at $33. Some of these same men are now holding yearlings at $35 to $37 and cows and calves at $70 to $75, with dry cows at $45 to $60, formerly priced at $35 to $45.

While steers fat have been bringing 12.50 to 13.50 from killers locally, cows have been bringing 9 to 10 cents fat. This is an average of three cents difference. Only a few years ago the difference between fat cows and fat steers was one cent per lb.

Investigation of various range districts show quite a few more twos and threes steers than would have been expected, and while they are now offered in lots mixed with other cattle, Arizona and southern Utah and Nevada will probably put up 20,000 head altogether from the ranges for next spring delivery. Of course, this total is insignificant in comparison to demand.

CARELESS HANDLING OF SILAGE

Occasional reports of the sickness or poisoning of cattle that have been fed on silage indicate a greater need for care both in the making and handling of silage, says Dr. L. P. Beechy of the agricultural college extension service. Silage put up too green develops high acidity and causes digestive disturbances. If silage is moldy it should never be fed to horses and if fed to cattle close watch should be kept for any unfavorable symptoms.

No more silage than is cleaned up at each meal should be fed. Portions left over should be discarded.

In feeding silage attention should be given to the bowels. Irregularity may be avoided by the use of bran and oil meal.

Ever notice that some people can't give a compliment without mixing it with quinine?

Farm Equipment

Every up-to-date farm has its clipping machine for horses and dairy cows. Horses work better when relieved of winter coats—cows give cleaner milk when flanks and udders are clipped. Agricultural schools and Government farms use clipping machines. You should have one. Get a Stewart Ball Bearing Clipping Machine No. 1, $9.75. Send $2.00—pay balance on arrival. Or write for 1919 catalog.

CHICAGO FLEXIBLE SHAFT COMPANY
Dept. A 101, 12th St. and Central Ave., Chicago, Ill.

Calf Scours

Save every Calf. High meat and milk prices make control of Calf Scours more necessary than ever before.

Scouring calves indicate a germ infection that is likely to run through your entire herd with serious losses. The loss of one calf is bad enough, but nothing compared to your loss when the infection spreads, as it will unless checked. Then your year's work in building up your herd is wasted and your profits lost.

B-K, the powerful germicide and disinfectant will promptly stop scours and finally banish it from the premises. B-K contains no poison, acid nor oil. When used internally it destroys germs, heals inflamed membranes, relieves irritation, restores healthy action. B-K may be given freely in milk and drinking water.

The B-K plan is simple and practical. It is giving wonderful results. Send for "evidence"

FREE BULLETINS: Send for our valuable bulletin No. 136, "Calf Scours," also information on other farm uses and our "Trial Offer." If your dealer does not have B-K, send us his name.

REGULATION OF STOCK YARDS

SPEAKING before the American National Live Stock Association at the Denver meeting Secretary Huston touched upon the subject of stock yard regulation as follows:

"There are parts of our marketing arrangement in which you are and have been deeply interested. I refer to the stock yards and packing houses. Two years ago I expressed my views before this body on the necessity of controlling these agencies. I have been convinced for many years that the government should regulate them. I have really got beyond the point of seeing the necessity for further argument. Not only you, but all the people of the nation, are intensely interested in what happens in the stock yards and the great packing houses. Their operations affect every man, woman and child in this nation.

"These establishments, as the lawyer would say, are largely affected with the public interest. I do not know what percentage would express the public interest, but it would not fall very far short of 100 per cent. The people of this nation are not willing to let a few men have an absolute determination of what happens in them, of what happens to the live stock of the nation from the time plans are made for its production on the farm until it reaches the consumer. There is too much at stake. The fortunes of too many people are involved. Of course, those in control of the packing houses and the stock yards say that everything is just right. As Senator Kendricks says, they admit it. They have admitted it to me. They even spend great sums of money in the newspapers making admission of it. One of the chief representatives of the packers told me several years ago that the whole business was as clean as a hound's tooth and that there was nothing to be apprehensive about. I replied that, unfortunately, the people did not seem to believe this. They had their suspicions. I added: 'If what you say is true, the people ought to hear the truth from an impartial source. It would be good business for you to have the people told the facts by an impartial authority, and good business for you to be rid of the suspicion that attaches to your statements and operations.' Again, they admit that they have the requisite wisdom to handle these great establishments. They admit that they can handle them better than anybody else. They are wiser than all the people. That is what the paternalists, the favored few, have said from the beginning of history. That is the essence of the old medieval theory of government. A few men are wiser than all the people. Of course, I do not admit that. I do not admit that the few men in control of the packing houses and stock yards are wiser than all the stock men of the nation and all the consumers. I do not believe that they should be permitted, uncontrolled, to determine all the issues in which the public is so vitally interested. If I had to admit that they possessed all the wisdom they say they do, then I would go further and say that I would prefer to have a little less wisdom, a little less paternalism, and a little more freedom, and, if necessary, to pay the difference."

MILK PRICES IN 43 STATES

Monthly reports are now issued by the bureau of markets showing wholesale and retail prices of milk in over 100 cities in 43 states. The report for February shows retail prices for standard bottle milk delivered ranging between 11 and 20 cents a quart with the most usual prices 14 and 15 cents a quart. Prices paid producers per quart f. o. b. city varied from 6.4 to 12.7 cents a quart with the bulk of the milk ranging between 7 and 8 cents a quart. The February report carries a column showing the "dealers spread" in cents per quart on 3.5 per cent milk delivered to retail trade. It ranges from 4.4 cents to 11.5 cents.

SWINE BREEDERS WILL MEET AT DAVIS

By Frank B. Anderson, Director California Swine Breeders Association

Having outlined a plan of extended organization for the California Swine Breeders' Association in his address before the state convention of farm advisors this week at Davis, President C. B. Cunningham will put the proposition up to the annual meeting of the membership at the University Farm, Davis, Thursday, April 10.. The plan calls for the establishment of association units as a part of every farm bureau in the state.

Much work has been done this past year in organizing the pork producers of the state and at the same time accomplishing what good could be done for the business, but the work can be made to proceed at more rapid pace by the plan explained by President Cunningham to the farm advisors, and their aid will be enlisted in forming the local organizations of pig growers.

By affiliating with the farm centers the California Swine Breeders' Association can be brought in touch with every hog grower in the state, be he large or small, because the farm bureau movement has been extended so that there are very few farmers who are not members, and every man who grows a pig to sell will be interested in the movement for a better hog business which this association has set about to accomplish.

In addition to the organization plan to be worked out at next month's meeting, the association is planning a number of interesting discussions on swine topics by prominent authorities. The meeting should be attended by hog men by the hundreds, and the usual hospitality of the University Farm will be extended.

CARRUTHERS LOSES HERD BULL

W. M. Carruthers, Shorthorn and Berkshire breeder of Live Oak, reports that on March 6 his herd bull Count Glory died as the result of a choking spell.

In the death of Count Glory, Carruthers not only suffered a heavy loss, but the Shorthorn interests of this state have lost a bull that promised to be quite a factor in building up the breed.

Count Glory was dropped in September, 1914, and was sired by the Curtis bull, Count Avon, an International champion, rated as one of the best sons of Avondale. His dam was British Laura, by imp. Red Knight.

Carruthers purchased him in 1915 with the idea of showing at the P. P. I. E., but owing to the foot and mouth disease quarantine he did not arrive in time. His first appearance in a California show ring was made at the 1916 state fair when he was made grand champion by W. A. Cochel. In 1917 and again in 1918 he headed the list. As a calf, he defeated his sire and Carruthers states that he never wore any color out of the ring but purple. Until the past season, he had not been extensively in the breeding herd, but the calves he has to his credit—especially this spring's crop—are of a character that would indicate he had splendid possibilities as a sire.

Carruthers has now placed the good white bull, Hallwood Villager, by Village Flash and out of Lavender Queen, at the head of the herd. Hallwood Villager was first in the two year old class at the 1918 state fair and gave his roan stable mate a run for the grand champion honors. Many of the choicest calves at Carruthers Farms were sired by this bull and there is little doubt but that he can take the place, very acceptably, of Count Glory.

In addition to the above bull Carruthers has two attractive calves that he plans to develop, both by the dead bull, one out of Mayflower 19th, a daughter of Fond Memory, and the other out of Rookwood Bessie by Avondale.

HOLSTEIN SALE

Several years ago ex-Senator Clark and his brother J. Ross Clark, president and vice-president respectively of the Salt Lake Railroad, decided to place a dairy on the large Montana Land Co. ranch of 12,000 acres which they owned.

The dairy barns were located at the southern end on the ranch near the boulevard, four miles north of Long Beach, and the best equipment was obtained to produce a high grade of milk.

The foundation of the present herd of Holsteins was firmly laid by buying the best that could be obtained in grade Holstein cows. Price was no object when the right kind of cows could be found, and the herd was noted for the uniformity of type and producing qualities. Nothing but the best pure bred registered sires have been used in order to grade up the herd, and it has also been the policy of the owners to retain no cow that could not show a profitable production at the end of the year. By careful culling the unprofitable cows were weeded out and today the herd stands as one of the best herds of grade Holsteins in the state.

It is with a feeling of regret that the owners have decided to dispose of the herd at public sale, but they feel that buyers will reap the benefits of the years of time and expense that they have been to in building up their present dairy herd. Saturday, March 29, has been set as the day, and it should indeed prove a red letter day to buyers looking for grade Holsteins of quality.

The services of Col. Ben A. Rhoades and Harold B. Rhoades have been secured as auctioneers for the sale. An old fashioned Spanish barbecue will be served at noon and a pleasant and profitable day may be expected by all who attend.

BELIEVES IN FRUIT AND HOGS

Extensive improvements are now in progress on River Bend Farm, property of W. W. Everett, St. Helena, part of which is the bringing into bearing of a 60-acre prune orchard.

It is Mr. Everett's intention to devote the orchard land, as well as his alfalfa pasture, to the raising of Duroc-Jerseys.

His present herd boar is Orion Defender by Orion Pal out of a daughter of Defender, and he still retains his foundation sow, Miss Educator, by Chief Protector Again.

At present the River Bend herd is not large, but it is Everett's intention to gradually increase his operations through the purchase of additional sows and by selections from his own productions.

CONEJO RANCH RECEIVES 68 EASTERN SOWS

H. H. Braly of the Conejo Ranch, Newberry Park, states that they have recently received 40 Duroc-Jersey sows and 28 Hampshire sows.

The sows were selected in the east by Bert Manly and represent the most popular blood lines available and all are carrying the service of the sensational boars of the two breeds.

The Conejo Ranch is one organization that has succeeded in maintaining two breeds without either taking second place. As a matter of fact some of the best Durocs and Hampshires shown during the past two years have been from this herd.

It is expected that two full show herds will make the circuit of all fairs this fall.

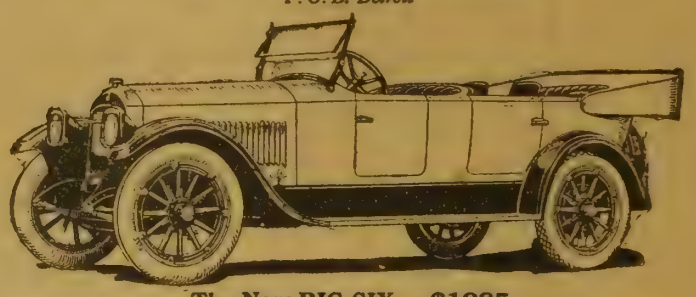
Have You Seen the New

STUDEBAKER CARS?



Built to Meet the Needs of Rural Service and Proved On the Country Roads of America

The New LIGHT-FOUR — $1125
F. O. B. Detroit

The New LIGHT-SIX — $1585
F. O. B. Detroit

The New BIG-SIX — $1985
F. O. B. Detroit

THE three New Studebaker Cars are distinctive in design, with powerful and economical motors, built for heavy duty service; intermediately located transmission; genuine leather upholstery; Gypsy top with oval plate glass windows in rear; permanent and lustrous finish.

To make sure of their ability to deliver continuous service under all conditions, original cars of each new model were given a 10,000 mile endurance test on the worst country roads of America. Thousands of cars in owners' hands have since convincingly proved their correctness of design and mechanical excellence.

Studebaker manufactures completely in its own factories its motors, bodies, tops, axles, transmissions, steering gears, springs, fenders, and cuts its own gears and other vital parts, thus eliminating middlemen's profits. Only because of these manufacturing advantages and large quantity production is Studebaker able to build such high quality cars at their respective prices.

The name Studebaker is your assurance of lasting satisfaction.

World's Greatest Yearly Record Bull

Uniformity in production in the ancestors of a registered dairy animal has long been recognized as a fundamental fact in determining the probable prepotency of a sire and the transmitting ability of a dam, and the average production of all the dams in two, three and four generations of a pedigree rightfully takes a large place in determining the value of a breeding animal.

The seven and thirty day official records have played a tremendous part in the development and popularization of the Holstein breed, and it was held a great acomplishment when a breeder produced the first bull whose seven nearest dams averaged over 30 pounds of butter in seven days under official test. Since that time a considerable number of bulls have been born with equal or higher average backing.

Holstein breeders generally have come to give full credit to the seven and thirty day records as a breed asset, but in the present day more and more of the most far-sighted recognize the fact that a truer proof of a cow's producing and transmitting ability can can only be measured by her yearly records of milk and butter production, and going still farther her ability to produce year after year and to reproduce regularly, and offspring of the yearly record producers are now attracting greatly increased demand from those breeders who keep ever in mind the real function of a dairy cow and the needs of the dairy business as a whole.

Having been, first of all, successful dairymen, and knowing from the fullness of experience that some dairy cows have an inherent ability to maintain large production throughout an entire year while probably as many more have the habit of starting off when fresh with large production and dwindling down to almost nothing in periods varying to from four to seven months, it was perhaps only natural that A. W. Morris & Sons, Woodland, should have taken up the breeding of registered Holsteins with the tremendous value of yearly record production fully fixed in their breeding plans, and during the years that they have been establishing themselves as one of the very foremost of the world's Holstein breeding establishments they have never for a moment lost sight of the real issues in the breeding of dairy cattle nor the interests of the dairymen who depend upon the breeder for registered bulls that are bred right to increase the production of his herd.

With this consistent policy in operation the Morris herd has produced many world's record cows and heifers in the various classes of the yearly record performers, and have gradually built up an average backing of yearly records throughout their herd that stands unequaled in the history of Holstein breeding.

Thus it was a natural consequence that in this herd there should be born the first bull whose seven nearest dams average over 1000 pounds butter in one year ,and it may be noted here that the seven nearest dams include three cows that have made world's records. This bull still has the highest average in the world for the yearly butter production of his seven nearest dams, although since his birth, two other bulls, full brothers, have been born in eastern herds with an average above 1000 pounds butter in one year for their seven nearest dams.

Sir Aaggie Mead De Kol is the name of the masterpiece of Morris breeding to date, and his name indicates something of the wonderful families in his pedigree. His sire is Sir Aaggie De Kol Acme, son of Aaggie Acme of Riverside 2nd, 35.38 pounds butter in seven days, and her strictly official record of 1331.77 pounds butter in one year is a world's record, and it might be stated here that her first daughter to freshen in the Morris herd is now on official test and at this writing has above 23 pounds of butter in seven days to her credit as a junior two-year-old. Sir Aaggie De Kol Acme is sired by Aralia de Kol Pontiac Segis, whose dam is that sterling former world's record cow, Aralia De Kol, one of the foremost transmitting cows of the breed.

The dam of Sir Aaggie Mead De Kol is Aralia De Kol Pontiac Mead, 34.42 pounds of butter in seven days as a senior three-year-old, 932.34 pounds butter in one year as a senior two-year-old, the California record in class. She is by Segis Pontiac De Kol Burke, son of the world's former record cow, Riverside Sadie De Kol Burke, who by the way is the sire of the 23-pound daughter of Aaggie Acme of Riverside 2nd mentioned above, and her dam is Aralia De Kol Mead, 1215.20 pounds butter in one year on strictly official test, and she in turn is out of Aralia De Kol. Thus we find that the averages for the seven nearest dams behind this bull are as folows: Butter, one year, 1093.99 pounds; milk, one year, 23,575.54 pounds; butter, seven days, 31.14 pounds; milk, seven days, 660.07 pounds. These tremendous averages mean much in themselves, but coupled up with the abundantly proven transmitting ability of the nearest ancestors they stamp this young sire one of the very greatest individuals yet produced in the history of dairy cattle breeding.

Sir Aaggie Mead De Kol is also an individual of high excellence, as might be expected from the blending of the great type of his near dams and sires, and is now of service age and being used lightly on some of the best cows and heifers in the Morris herd.

Sir Aaggie Mead De Kol
Who has the highest average in the world for yearly butter records of his seven nearest dams. Bred and owned by A. W. Morris & Sons, Woodland. All of the high class females consigned by the Morris firm to the Guaranty Sale, March 27, are bred to this bull.

New Grasses For Foliage and Silage

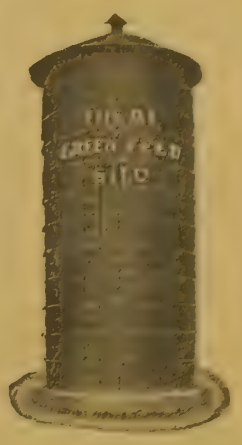
There is never ending inquiry for permanent and perennial pasture grass to suit all soil and climate conditions of the southwest. It is a big problem to find such a grass that will endure both the frosty winters, the hot and dry summers, adobe or sandy soil, the damp meadow or dry mesa, buf as difficult as it would seem we are gradually getting closer to the ideal.

Continued experimenting with new importations have brought into prominence several grasses of such merit that to refuse to try them would mean a financial loss to you.

The Napier or Elephant Grass has been so much talked about lately that little need be said here. Now that the seed may be had, although in limited quantities, a packet containing about 3000 seeds may be purchased for 25c, and it requires less than 5000 plants to secure the best results from an acre; within four months there will be enough canes to plant many acres. The crowns survive the summer drought and make an amazing growth with little rain.

It grows readily from joints, which after the canes are hard may be cut midway between the joints, and the joints planted as potatoes. Napier joints may be purchased at $1.00 per dozen, or $5.00 per 100, postpaid.

The wonder forage plant was first introduced by the Aggeler & Musser Seed Company through their 1919 catalog.



It has the sorghum sweetness of sugar cane, and the stooling and heading attributes of the Sudan, one stool having 57 canes with 161 heads and 12 feet tall would indicate full 75 tons of forage per acre, and may be cut several times during the season, and if cut not too late will survive the winter frosts.

Five pounds of seed is sufficient to plant one acre. Culture is the same as for any other sorghum. Price of the seed is 75c per lb., or 5 lbs. $3.00, postpaid.

Smilo Grass is probably the nearest ideal grass for the range of the southwest. It grows anywhere, anytime. Try it. Send 50c for one ounce, or $3.00 for one pound, which is enough for one acre. For other grasses see our catalog.

AUCTION

300 Head of Holstein Cows & Heifers 300

2 Pure Bred Registered Holstein Bulls

On the Montana Land Co. Dairy Ranch at Bixby Station on the Salt Lake Railroad. Four miles north of

Long Beach

On Cherry Avenue, north of Signal Hill. From Los Angeles take the Long Beach P. E. cars to Cerritos Station, conveyances in waiting morning of sale at 10 a. m.

Saturday, March 29th, at 9 A.M.

This well known herd includes 120 choice young, nicely marked Holstein cows, mostly with first and second calf. There are no old cows in the herd. A large number are just fresh and milking heavily. Also 25 head of springers.

180 Head Holstein Heifers 180

45 head from 14 to 24 months old. A number of springers in this lot. 50 head from 6 to 12 months old. Balance are fine milk calves. Remember this stock is the result of years of scientific breeding. You could travel all over California trying to find a better marked, smoother lot of heifers than these.

Arrangements for credit can be made by purchasers from a distance by furnishing satisfactory bank reference.

Don't fail to attend this

Genuine Closing Out Sale

Owners: Ex-Senator Clark; J. Ross Clark

Auctioneers: Col. Ben A. Rhoades; Harold B. Rhoades
1505 South Main St., Los Angeles, Cal.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

State Dairy Bureau Report

The twelfth biennial report of the state dairy bureau has been made to the governor and placed in printed form for the information of the dairy and creamery people of the state. The first two sentences of the introduction cause one to ask if there is anything wrong with California dairying conditions:

"For many years up to the time of writing the last report (December 1, 1916) there had been a steady increase in the production of butter of from one to eight million pounds a year, and it had about kept pace with the increase in population. During the year ending September 30, 1917, there was a decrease of nearly one million and a half pounds, and during the year ending December 30, 1918, there has been a further decrease of over eight million pounds."

However, there has been a material increase in cheese production. Again, there have been very material decreases in the actual number of dairies and of number of head in some of the larger dairies.

One instance: In Central California one of the inspectors found in one day twelve places where people had previously been dairying were now deserted. Scarcity of feed, difficulty in obtaining milkers and attractiveness of other farm products are given as reasons for the shrinkage.

The report does not refer to any discouragement because of the stringency of the state dairy law, but we believe that has something to do with the great shrinkage. However, many dairymen believe that the higher quality product, raised by the law, will increase demand and prices until the reasons for the existence of the law will be manifest.

"The dairymen who sold their cows and went out of the dairy business have undoubtedly made a great mistake as everything points to good prices for some years to come."

The report gives hopeful information as to eradication of tuberculosis. From the state veterinarian information is had that the percentage of nonreactors has increased until now there are 67.24 per cent of the herds free from tuberculosis. This is far more favorable than in other states and countries.

Reports are made in the 14 different inspection districts of the state by the various inspectors, and there is given a series of tables showing butter produced in the state for the years '17-'18, this by counties, the same for cheese, together with other tables showing dairy production for a period of ten years. Then comes full list of creameries and cheese factories and condensaries in the state.

As to Forage Grasses

I have noticed, in your issue of February 15, mention of Napier grass, and at different times articles on Smilo grass. This would lead me to think that considerable interest is being taken in grasses suitable to dry lands.

The London, England, "The Economist" published the report of The National Bank of South Africa, at its ordinary general meeting of shareholders, held in Pretoria, Transvaal, in June, 1918. The Hon. Hugh Crawford particularly drew attention to the world-wide scarcity of animal supplies and also to fodder as having an important bearing on their future as a stock raising country. He went on to say: "I would in particular direct attention to the well known "Kikuyu" grass (Pennisetum longistylum), the feeding value of which is the highest known in the sub-continent. This grass answers splendidly to our climatic conditions and its free introduction should tremendously increase the stock carrying capacity of our farms."

It would appear to the writer that such a grass might possibly be of great value to the drier parts of this state. —Wm. Rennie, Barton Vineyard Co.

Regarding this grass we have asked Prof. P. B. Kennedy for further information, and he writes:

"In reply to your letter regarding Kikuyu grass (Pennisetum longistylum), I may say that it is another name for a common grass used by us as an ornamental in the United States for a good many years. In fact it is very common around Berkeley, and withstands the summer drouth remarkably. In general appearance it has never appealed to me as having possible forage value. Nor do I know of its having been experimented with for this purpose in this country. The roots are offered for sale by seedsmen in South Africa. It is a low growing plant for a grass, that is, namely, about two feet high, and the flowering stalks impress one as being decidedly unpalatable to stock. The leafage, however, may be of considerable value but it has not this appearance."

Herefords of High Merit at Public Auction

Quick Maturity, Uniformity and Size are Hereford Characteristics

84 Registered Hereford Cows, Heifers and Bulls

58 Females—26 Bulls

Tuberculin tested and guaranteed to be breeders

Buyers of foundation females are offered such a selection in this sale as has never before been made in California, including some very desirable young cows with calves at foot, some choice bred heifers in calf to some of the best bulls in the West, and a high class lot of open heifers of excellent breeding.

There are bulls of real herd heading quality in the sale, and the beginner can fit himself out in this offering with a complete breeding herd from the herd bull down.

RANGE BULLS—Leading Western breeders are sending to this sale a selection of good registered Hereford bulls that are especially well qualified for service in range herds. Hereford bulls of this breeding and quality have bred greater profits into literally thousands of range herds, getting the kind of offspring that mature quicker, make greater size with uniformity, and command better prices both at the feed lot and the block.

BUTTER AND CHEESE SCORING CONTEST

By S. L. Denning

The following butter and cheese makers will receive certificates from ward for the high average scores received by them for butter and cheese entered in the 1918 scoring contest:

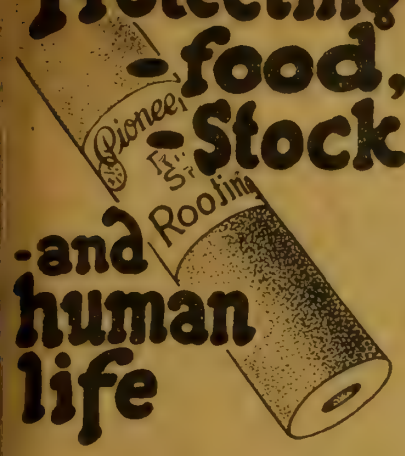
Butter—Grade A (requirement, average score of 92 or above in three entries), N. Nyborg, Modesto Creamery, 93.5; H. Dons, University Farm, 93.25; C. A. Johnson, Bodega Cooperative Creamery, 92.25; Thomas Moran, Oakdale Creamery, 92.16; W. F. Butler, Visalia Cooperative Creamery, 92.16. Grade C (requirements, average score of 90 to 92 in three entries), Ed Hooper, Hooper Creamery, 91.83; Fred Deter, Montague Creamery, 91.66; H. R. Pyke, Orland Cheese and Butter Company, 91.25.

Cheddar cheese—Grade A (requirements, average score of 92 or above in three entries), O. R. Lynch, University Farm, 93.66; H. C. Watson, Watson Cheese Factory, 92.

The 1919 Contest

The 1919 contest will consist of three regular scorings held in different parts of the state in localities which will be convenient for the largest numbers of the butter and cheese makers to attend. In connection with the scoring there will be held a buttermakers' competitive judging and a meeting at which dairy manufacturing subjects will be discussed. Last year there was considerable interest in the judging contests and meetings and as a result these features will be enlarged this year. The butter and cheese makers find it an advantage to attend these scorings in order to compare their product with others entered. The meetings also afford an opportunity for becoming better acquainted with other makers and for exchanging of ideas.

A detailed program of each scoring will be sent out with the call for entries. The first contest is to be held at the Gustine Creamery at Gustine on April 3. The second scoring will probably be held in July and the third scoring in connection with the practical buttermakers short course at the University Farm in November.



VETERINARIAN'S REPORT

State Veterinarian Chas. Keane has made report to the governor for the two years ending June 30, opening with the statement that the department continues to increase materially from year to year. "This is brought about by several facts, among which might be mentioned new laws, increased general recognition of the value of live stock sanitary control work, increased value of naimals, etc. The new state dairy law with its tuberculin testing provisions has not only increased our work in that direction very materially, but in addition, through the funds appropriated to carry on such testing, we have been enabled to increase the scope of our work without additional expense to the state."

The report is given up largely to the results of the tuberculin testing campaign under the new state dairy law.

As to hog cholera: "I am pleased to report to you that the number of

hogs in the state has materially increased and that losses of the same from the most serious disease of hogs, hog cholera, have decreased, and though outbreaks of this disease have occurred in nearly every district of the state, they have been almost immediately checked or controlled by the prompt use of anti-hog-cholera serum and virus and by the immediate detailing of representatives from this department to investigate all outbreaks of the disease."

Report is also made as to sheep scabies, blackleg, glanders, anthrax and forage poisoning.

BELIEVES JERSEY FUTURE BRIGHT

Dr. H. W. Hand of Orland states that in his judgment the future was never brighter for the Jersey breeders of California. He bases his opinion on the fact that dairymen of this state are coming to appreciate the value of better breeding stock of all kinds and that during the past year there has been more interest manifested in Jerseys than at any time since he came to this state. He makes this point, though, that the breeders must need do more record work than they have done in the past.

The doctor is breeding along the same lines he followed in Illinois and is a strong believer in Champion Flying Fox blood lines.

His herd has been selected with the view of combining true Jersey type and production and the entire herd of Jersey cows are in the Register of Merit.

One of his cows, imp. Brilliant Spray, has been three times grand champion of California, and one of her daughters was junior champion in 1917. Another, Oxford Daisy's Sweet Maid, was third in class in the United States when she finished her record, which placed her in the Register of Merit class.

His herd bulls are Oxfords Daisy's Keep On and Blossom Liberty Bond, both grandsons of Champion Flying Fox and are the only two, so the doctor states, west of the Mississippi.

While the doctor's practice keeps him exceedingly busy he finds time to act as president of the Orland Chamber of Commerce and the Orland Jersey Breeders' Association.

The Keep On herd will be shown at the Sacramento state fair this fall and do its share toward boosting the Jersey breed in this state.

PRACTICAL DAIRYING

The George Junior Republic at Chino is doing some practical work in educating the farmers of the future. It is doing it by giving a farm home to boys, most of them city bred, who come there to fit themselves for bread earning by crop production. We have formerly referred to the fact that this education is given an impetus by holding up before the boys examples of best in methods and best in stock and implements which can be procured.

Recently classes in animal husbandry from Pomona, also from Chaffey, Ontario, union high school, met with the boys of the Republic. These classes plan to meet monthly. At this particular meeting a practical demonstration of work of boys of the George Junior Republic was given; selection of dairy cows, demonstration of the Babcock test and other interesting matters in connection with both dairy and swine husbandry were given by advanced boys of the Republic, after which a general discussion of these matters was held by the two high schools and Republic boys, much to the profit of all concerned.

Both Major Perrin in charge of the Ontario boys and Professor Fieke of the Pomona class expressed their surprise at the knowledge and ability of the Republic boys in handling these subjects.

FARM BUREAU MEETNGS

Glenn County farm bureau, or rather center meetings, are scheduled as follows: Willows, 22; Elk Creek, 26; Grapevine, 26; Larkin, 28.

The main general topics will refer to: Membership round-up, county highways, fat stock auction association, legislation affecting farmers. Between dates of March 16 and 31 the farm advisor will be in attendance at annual farm advisor and farm bureau conferences.

American Horizontal Pump. Can also be furnished direct-connected to motor or engine.

CHEAPER THAN A WHIP AND BETTER FOR YOUR HORSES

A horse with bruised, galled and chafed neck or shoulders can't earn his feed. Whipping only increases his suffering. You can prevent such injuries for less than the price of a good whip. Equip your faithful animal with Tapatco—The pad made with our

NEW PATENTED HOOK ATTACHMENT

(Found Only on Pads Made by Us.)

Consists of wire staple with felt washer. It gives hook a firmer hold and prevents pulling off, even though fabric is weakened by long usage. Life of pad is thus materially lengthened. This is the greatest improvement since we invented the hook.

STUFFED COLLAR PADS

Filled with our Special Composite Stuffing

are better than other kinds. They are soft, springy, absorbent and serve as a guarantee against bruised, galled and chafed shoulders. Ask your dealer for Tapatco Booklet.

FERTILIZER

For Sale—Chicken manure in carloads. Cheapest and best fertilizer. MacDonald Sons, phone 101, Watsonville.

FARM BUILDING PLANS

W. T. Clarke, professor of agricultural extension of the University of California, writes of one work of the public service branch of that division which is sure to prove of material value to California producing interests:

"For the last two years the college of agriculture has been loaning farm structure plans to the farmers of this state. The plans were prepared under the supervision of Professor J. B. Davidson, our agricultural engineer, who has had wide experience in the design of architecturally and agriculturally correct structures."

Here is, for instance, a set of plans for a four-room farm bungalow. Elevations of the four sides are given in large blue prints, also detailed plans complete and ready for the carpenter to work on.

Doubtless there are plans for other types of houses, and a list of some of the plans shows that the university has help for the man who wants to build bunk houses, septic tanks, rabbit hutches, water towers, barns for beef cattle, dairy cattle, general stock, small purpose barn, houses for hogs, sheep and poultry, even details as to construction of sled type of bean cutter.

EARLY BAART WHEAT IN RIVERSIDE COUNTY

By Norman F. D'Evelyn

Early Baart wheat is withstanding the dry winter extraordinarily well in Perris and Murietta valleys, according to a report made to the agricultural department of the Sperry Flour Company at Stockton from the Los Angeles headquarters of the company. Its Riverside representative had made a trip through these two valleys and stated that he had received some fine reports on this new—to California—variety of wheat. It had come up very well, they said, and while other crops showed the effects of the lack of rainfall, the Early Baart wheat was green and appeared to have a peculiar tendency to draw moisture, "showing the dew on the leaves in the morning when the other crops are dry."

Nothing but favorable reports, writes Manager Coates, have come from points south of the Tehachapi regarding Baart. He is quite optimistic about the prospects of the coming crop. The ability of Early Baart wheat to withstand extremely dry weather during the growing period, as borne out in this testimony, confirms what was claimed for it by its sponsors, the Sperry Flour Company's agricultural department, during the statewide campaign it carried on last fall.

ONE OF MANY

"What's become of Bliggins?"
"He's laid up, a victim of the war."
"I didn't even know he had enlisted."
"He hasn't. He sprained his larynx telling how things ought to be done."

Weekly—24 to 36 Pages One Dollar per Year

Household Department

ON READING A CERTAIN BOOK

I turn a page, read on, and on,
A traveller up a pleasant road
Where others have before me gone
With brains that dreamed, with eyes that glowed.
Unmindful quite of time I fare,
From line to line my glances flit,
Delighted and bereft of care
By quip of humor, flash of wit.

Sometimes I con a paragraph,
Whose beauty makes me pause a while;
A happy fancy wakes a laugh,
An apt allusion lights a smile.
And so a feast my journey seems
Where I partake—yet leave behind
A wondrous board whereon there gleams
Untouched a banquet for the mind.
—Samuel Minturn Peck in Boston Evening Transcript.

THE BUTTERWORTH BAYS

Concluded from last week.

The young farmer stopped, and stared.

"I know I'm late, Joe." Dorothy Butterworth glanced half apprehensively at her husband, and then ruefully at her bedraggled gown. "But you see, there was an accident—it might have been dreadful,"—she shivered a little,—"and—why—what is it, Joe?"

Joe, staring and breathing heavily, still stood as if he were dumb.

She looked at him a moment curiously.

"It wasn't so very bad, after all—the accident," she explained. "It was one of the Bell girls visiting at the Grays'. She slipped and fell on the rails—the storm was awful. She seemed stunned at first, and we thought it was the third rail. The Dean boys were on the car, and one of them ran to the nearest telephone. I don't know what he said. But the girl wasn't badly hurt. She'll be all right in the morning. Did they call you, Joe?"

"Yes, they called me—the Meads." He had taken her arm, and his strong grip and the strange light in his eyes sent a fluttering thrill to her heart. "Let's get over here, Dorrie," he said, "at the meadow fence. It's nearer."

Again the sudden thrill fluttered her heart. He had called her "Dorrie"—the old pet name.

"Joe," she said, "just what did they tell you—the Meads?"

"They told me—" eH stopped, then went on slowly. "They sent Billy. He said that it was you—that you were—dead, Dorrie." The muscles of his throat tightened.

"Why, Joe, how could they! But of course everyone was confused, and the Bell girl did wear a gown like mine." They were at the edge of the ploughing now; the last fresh-turned furrow was just at their feet. She looked about the wide, empty field. "You were ploughing, Joe. Where are the team—the big bays?"

Joe Butterworth gave a sudden start, but the grasp on his wife's arm did not relax. "I don't know, Dorrie," he said. "Billy told me—that, and I—I just started."

With the light of a new understanding in her dark eyes, Dorothy looked round her—at the newly ploughed field, still fragrant of fresh earth, at the meadow beyond, at the green valley below. Her mind was a happy tumult; for over all, certain, but bewilderingly swift, the one thought rose and reigned supreme: this man, her husband—her Joe— cared.

"Joe?" she said, softly. "Joe?"

"Yes, Dorrie."

It was not much to say, but it was enough. Each knew that again there was the old, sweet understanding.

"We must find the horses, Joe."

"Yes, we'll find them now, Dorrie."

They came upon the broad track made by an overturned sulky plough and followed it across the field, and on to the sugar-bush grove. In a clump of "second growth" they found the team. Big Ned was down, but he was lying quietly; his mate was ni

THE TREE

By Joyce Kilmer
Who gave his life in France.

I think that I shall never see
A poem lovely as a tree.

A tree whose hungry mouth is prest
Against the earth's sweet flowing breast.

A tree that looks at God all day
And lifts her leafy arms to pray;

A tree that may in summer wear
A nest of robins in her hair;

Upon whose bosom snow has lain;
Who intimately lives with rain.

Poems are made by fools like me,
But only God can make a tree.

ping at the bushes on either side. Except for a few slight cuts, neither horse was hurt.

Together Joe and Dorothy followed the sugar-bush road out to the meadow bars. Below them, in the little valley, lay the home buildings.

"It's lovely down there, Joe," said Dorothy, softly. Presently she added, "But I'm going to work at our yard the first thing I do. I didn't realize that it was so littered up."

"And I'll fix those barn doors good and strong tomorrow morning," said Joe.

And so they went down through the broad meadow where the bobolinks were singing in the sun, into the quiet home valley, together; and trailing behind them, cropping an occasional mouthful of sweet-scented clover blooms, came Ned and Dandy Jim.—Youth's Companion.

A LETTER FROM NAPA COUNTY

Dear Cultivator: In a recent number of your valuable paper a contributor gave us some fine suggestions relative to uses of various sacks used as food containers.

Not only are these sacks money savers but they may also become trainers in good morals and gentle manners. A few years ago I was laid up by an injury and a 17 year old neighbor girl, willing to add to her spending money by helping me with my work, came attired in a white dress to sweep, scrub, clean windows and do all sorts of so-called dirty work. At the end of the day she was sufficiently tidy to receive callers. The white dress did it. Try making daughter's kitchen dresses of sugar sacks and see if it will not break her of the habit of wiping her hands on her apron. Make it neat and she will feel dressed up, be on far better terms with herself, keep cleaner than she ever did in a faded print and will form the habit of keeping everything about her as neat as she is herself. The cleanliness which is next to godliness needs to invade the home kitchens as well as the parlors and the white dress will do it. I tried it myself and it has worked wonders for me. The white doesn't fade, is easy kept clean and wears well.

Bleach the small meal sacks well, cut into bias lengths, sew together, turn edges under, press and wind on strips of card board and you have bias folds ready for all kinds of underwear, aprons, etc.

When making kitchen dresses and aprons of sacks don't forget to make dainty dust caps to wear with them.

If "Anonymous" in writing for the Cultivator of March 8 will consider the food value of eggs and milk as compared with cornstarch and water, especially for children, I believe she will stick to the former.—A. M. H.

PARIS TO CONSTANTINOPLE

The International Sleeping Car Company announces its intention of re-establishing the Orient express from Paris to Constantinople as soon as conditions render such action possible. Before the war the route from Paris lay through Strassburg, Munich, Vienna, Budapest, and Sofia; but when service is resumed, says the Near East, the train will run to Milan from Paris by the Mont Cenis or Simplon route, and thence through Venice, Trieste, Agram, Nish, and Sofia to Constantinople. From Nish a section will run through Uskub, Saloniki, and Larissa to Athens.

The re-establishment of the Orient express to Constantinople will be only the first step in the development of communication with the East. It is proposed to extend the service to permit of direct connection between France and the Holy Land, and it is believed that this will be done before 1920. The final stage will be reached when the Bagdad railway has been completed and when London and Paris are connected by rail through a channel tunnel. It will then be possible to travel direct from London to the terminus of the Bagdad line near the Persian Gulf.

Does a sweater or other knit article need mending? Use yarn to match and put in cross threads as for darning but do not darn. Chain stitch down through the cross threads and the ridges will be so well matched that the mend will not be noticed.

MAKE ONE BATCH OF DOUGH DO FOR TWO BAKINGS

Make up a batch of dough with Calumet Baking Powder. Use part of it in a baking for your evening meal. Put balance of dough in the ice box—for breakfast biscuits. Fine, flaky, tempting biscuits that fairly "pop" with goodness. The leavening action of

CALUMET BAKING POWDER

never begins until the baking is put into the oven—exposed to oven heat. There is no loss of strength in can *or* in dough. While you are saving minutes with Calumet you are saving money and materials too.

Ranch Homes as Modern As Ranch Equipment

This is the great need of the moment. It is just as necessary that the house-wife have the very latest and most up-to-date house-keeping "aids" as it is to have tractors instead of hand plows in the field.

Wouldn't you rather turn to a *really* restful home, pleasingly furnished, than to find the house boresome and your wife too tired to be civil? Be sure also that your home is a credit to your standing in the community—

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste—(Atomic Sulphur)—and for dusting.

For Lime Sulphur Solution, use our DIAMOND "S" BRAND refined Flour Sulphur. We can furnish you this sulphur at such a low price that it will pay you to mix your own solution.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our diamond "S" Brand Powdered Sulphur. Write direct to

San Francisco Sulphur Co.

624 California Street, San Francisco, Cal.

We are equipped to make immediate shipment. Send for illustrated booklet; price list and samples, and please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Tel. Kearny 871.

LIVE STOCK

By F. P. Allen, Bureau of Markets, Los Angeles

Producers of beef cattle are experiencing some difficulty in finding a profitable market for live steers. The extraordinary demand for cows in this city is mainly responsible for this condition. The extreme range of prices on steers from common 900 lb. grades to 1250 lb. choice steers in Kansas City (where export orders absorb those weighing 1100 lbs. and up) is $10.00 to $18.75 per cwt. At present there are no export or army orders of any size being filled in this city, hence local killers have to depend upon retailers for an outlet for steers, but instead of taking steers, these retailers demand cows.

Very light receipts of hogs in the last week has resulted in sharp advances in hog prices. It appears that hog feeders have sold off their supply very close without regard to the future. There is an active demand for feeder hogs right now, but the available supply of feeder stock is inadequate to fill this demand. The quality of the receipts of finished hogs now arriving here is not very good.

A decided falling off in the receipts of lambs is responsible for recent advances in the lamb market. The bulk of the supply is of inferior quality taken as a whole, but the few lots of choice stock are commanding fully 50c per cwt. more than last week's prices.

Young spring lambs are in evidence in a few of the local killers' yards and they meet a fairly good demand for this product.

Yearlings and wethers are in light receipt and sell on a firm market. Light weight ewes sell well at good figures but the heavier grades are dull and draggy.

Good steers .....13.50@14.50
Medium steers .....11.50@12.00
Common steers .....9.50@10.50
Good cows .....11.00@12.00
Medium cows .....9.00@10.00

Strawberry, bx. .....3.00@3.50
Los Angeles .....1.50@1.75
Squash—Cream .....90@1.00
Spinach, lb .....3@5

After serious delay account unfavorable growing conditions in Central California, cuttings will start the second week in March. It is planned to ship some of the early cuttings and possibly later ones, but about 90 per cent of the acreage has been contracted by canners. The average shows a material increase over last year, and prospects are for abundant supply to meet shipping demand which appears dubious.

Tomatoes, Mex., cr. .....2.50@3.00
Turnips, bag .....1.50@1.75

FRESH FRUITS

Wholesale selling price:

Apples: Demand and movement good, little change in prices. Quality and condition generally good. Street sales: California Yellow Newtowns, fy., 3.25@3.50. Oregon, Yellow Newtons, extra fy. medium to large 3.50. Washington, Winesaps, extra fy. medium to large 3.00@3.50.

Bananas .....6½@7¼

Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58½
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran, 42.00; shorts, 42.00; middlings, 42.00; rolled barley, 48.00

@50.00; alfalfa, 32.00@34; scratch feed, 3.75 per cental.

HAY

Under date of March 15 Scott-Magner & Miller reports:

Export has been light and lack of freighting facilities is probably the cause. There has been little local demand during the week, although short receipts have been moved without much congestion.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market. For prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.

Fancy Wheat hay (light 5 wire bales)	23.00@24.00
No. 1 Wheat or Wheat and Oat Hay	19.00@21.00
No. 2 Wheat or Wheat and Oat Hay	15.00@18.00
Choice Tame Oat Hay	20.00@22.50
Other Tame Oat Hay	15.00@18.00
Wild Oat Hay	15.00@17.00
Barley Hay	15.00@17.00
Alfalfa	15.00@18.00
Stock Hay (in order)	13.00@16.00
No. 1 Barley Straw, bale	.50@80

Damaged hay (all kinds), according to condition.

Citrus Fruit Market

Los Angeles, California, March 19, 1919.

This year's return from oranges from California will bring the state more than double the amount of cash secured in many of the preceding years, and far more than the greatest of citrus returns. The frost injury is found to be lower than anticipated, and there have been no ill results in lowering quality of the fruit which was not actually frozen. This fact is being appreciated by the trade and invariable good prices and occasional abnormal price are secured. Sales generally are running between $5.00 and $6.00, and many sales above $6.00. This is true not only as to Navels but as to Seedlings, Mikes, and other varieties.

Lemons, however, do not receive much encouragement and general low prices prevail.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 10,839 cars; lemons 2761, total 13,600. To same date last season; oranges 4962, lemons 1388, total 6350. Central California this season; oranges 2968, lemons 347, total 3315. Last season to same date; oranges 1879, lemons 110, total 1989. Northern California; oranges 244, lemons 2. Last year same date; 202.

MARKET NEWS

Asparagus from the Delta districts is arriving on the San Francisco market in small quantities. Prevailing weather conditions will bring receipts up rapidly, but no carload shipping for some time yet.

The cabbage crop in Southern California is not turning out very satisfactorily. Yields are no better than last year. With the reduced acreage for spring shipments, indications are that carlot movement in March to June will not exceed 700 cars. Stanton, Garden Grove, Brookhurst and Como districts are making carlot shipments. Late varieties seem to stand still. In some districts the heads show signs of bursting before they mature. San Fernando district—Apparently no damage was done from heavy winds as crop is too far advanced. There was a strong demand here this week and 9 cars were shipped. The stock is being packed in regular California pony sized cabbage crates with average net weight of about 80 pounds.

The cabbage produced in the Colma district for winter shipment is the Flat Dutch variety. The acreage is above normal, growers having expected a continuous demand from kraut manufacturers on account of government requirements. However, this demand having been satisfied the movement has been slow. During the past ten days dehydrators have been buying big heads while smal'er hard heads are being packed for Middle West shipment, thus causing a fair movement.

Rhubarb shipments are just starting, about two weeks later than usual.

The heavy California shipments of cauliflower are now from the central part of the state.

Three hundred thirty-six carloads of lettuce were shipped from the Imperial Valley up to March 1. Yield is about 45 per cent of normal. Sizes are still small due partly to growers cutting prematurely for high market. Winds and cold weather are also retarding the growth. No period of excessive shipments is expected.

The quality of the lettuce in the San Fernando is fine and the bulk of the crop is maturing well. Heavier shipments are expected about March 15.

The outlook for peas in Central California is dubious. The excessive rain has washed hillsides, destroying seed and injuring blossoms, turning some vines yellow, but good crops are still expected providing weather this month is favorable. The crop is backward. Southern section Eastern shipments are under way from Imperial Valley. Carlots are expected soon with heaviest movement the latter part of the month. With a much larger acreage than last year, fairly good stand, and excellent vine growth, and heavy bloom, prospects for shipments are good. The weather is cold and windy and crop is late, but better quality than last year is expected.

Preliminary estimates of strawberry acreage for the central coast counties are 880 acres. The principal increase has been in Santa Clara, Watsonville, Mayfield, San Juan and Sunnyvale districts. Florin district, Sacramento County, reports 900 acres 1918, 750 acres 1919. Growers are contracting 10 cents per pound for canning.

Carlot shipments of peas have begun from the Brawley district.

Pennsylvania beef feeders are not sending half fat cattle to market as it has been found that fully finished beef commands sale so much more readily and at a material advance.

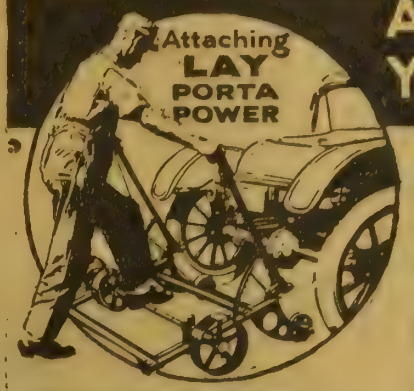
Reports from 13 potato producing states indicate immense cut in the acreage of potatoes to be planted in 1919. These states report planting for 1918 as 223,845 acres while the indicated acreage the coming season is 132,044. The more important reason given to account for the shortage in acreage this year as compared with last year are, high cost of fertilizer, high cost and scarcity of labor, high cost of seed, high cost of packages, high freight rates and fear of car shortage, low price of product and consequent losses in 1918, excessive rainfall, preventing the preparation of land for planting.

Leon M. Estabrook, chief of the bureau of crop estimates, reports that farmers of Gloucester County, Pennsylvania, are disgusted with trucking with guano at $80 to $90 per ton and labor almost unobtainable. "I have last fall's crop piled in the field and cannot get expenses, freight 52 cents a hundred, barrels 55 cents each, commission 10 per cent, cannot live at these prices."

Los Angeles County expects to plant 1000 acres less of potatoes than last year. The planting last year was 7000 acres. Orange County will likewise shrink her 3000 acres last year to about 2000 this year.

Local seed for spring crop of potatoes is very scarce and high priced and for this reason plantings are not expected to be as heavy as last year. The bulk of the planting will be during March.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS



From post card reports to the Los Angeles branch of the bureau of markets, report is made of the following shipments of cars of products from California for the week ending March 17: Apples, 21; bage, 103; cauliflower, 130; celery, 17; artichokes, 22; Brussels sprouts, 2; cabdried apples, 4; dried apricots, 2; dry beans, 67; dried figs, 1; dried olives 4; dried peaches 5; dried prunes, 20; lettuce, 124; mixed fruit, 1; mixed vegetables, 54; mixed fruit and vegetables, 23; mixed dried fruit, 3; pears, 1; peas, 2; potatoes, 65; raisins, 75; rhubarb, 2; spinach, 5; sweet potatoes, 1; turnips, 1; Mexican tomatoes, 43.

HOW ONE FARMER PROGRESSED A HUNDRED YEARS IN A DAY

First; you slip Lay Porta Power under the rear axle, press down on two levers, slip on a belt that connects with a line of pulleyshafting in the shed, and start the Lay Milking Machine. Cows are milked in no time. Throw on the separator belt—one more job done. Feed mill next—then the grind stone or churn.

Then you put the saw rig on the back of the car with Lay Porta Power on the running board and drive down to the woodlot. In half an hour you've sawed more wood than you could in a day by hand.

Back to the house and hitch up to your Lay Electric Lighting Plant and charge the storage batteries for modern Lay Farm Light for house and barn; and then fill your tanks with a Lay Porta Pump.

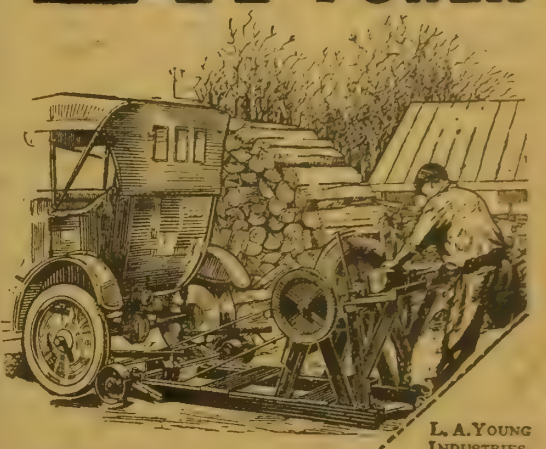
Release the levers and the car is ready to run in town with, or for family use.

This marvelous Farm Power has cost almost nothing. Just a little gas. There is almost no wear on tires. You get the same mileage out of tires and do all this extra work besides.

This whole Farm Power Outfit-Car, Lay Porta Power, Lay Milking Machine, Lay Porta Saw, Lay Farm Light, Lay Porta Pump, Lay Porta Mill, costs about what one laborer would cost for a year and they'll do your farm work for many years for practically nothing.

Cheapest power on earth and most efficient. Each machine sold separately. Lay Porta Power will operate any machinery you now own that can be driven by a belt.

Power on the farm means profit. Portable Power—Lay Porta Power. Write for full information. We can employ a few farmer agents. Every one buys on demonstration—the proposition is that logical.



He was puzzling over the labor problem.

"Trouble with me is," he said, "that I'm farming the way they did a hundred years ago. All hand and horse labor. What I need is Power."

He bought an automobile. That saved several hours a day getting the stuff to market. Then we showed him how to hitch up the wonderful auto power plant to do pretty nearly all the hard work of the farm. He could move his power about where the work was—that was the first big point. And the Power was always ready.

Here's a sample day when you Farm the Lay Way with

The Fine Art of Brooding

Written for California Cultivator By Jean A. Koethen

FROM the time when the tenderest heart the world has ever known cried out in its agony, "O Jerusalem, Jerusalem, how often would I have gathered thy children together, as a hen doth gather her brood under her wings," the brooding of young chicks has been synonymous with tenderness and love. Here is where artificial brooding fails. There is no tenderness, no motherly cuddling about a distillate stove or a hot water pipe. But the hen also sometimes fails in this respect. When she does, the artificial brooder is to be preferred. If a brooder stove does not cuddle its charges, neither does it trample their little bodies nor kick them around. Mothering is a great thing, and the weaker chicks are handicapped without it. But the most essential element of mothering, warmth, is one that can be supplied by stove or electric light or hot water pipe or sunshine. Which of these is best depends upon circumstances.

Mother Biddy's Faults

I used to be quite firm in my conviction that the hen is the best of all brooders—that the warmth and vitality of her body, and her soothing, motherly cluck, supply something no artificial brooder can give. I still think a good hen is the perfect mother, but I am fully persuaded that a poor hen is worse than any brooder. The past two weeks I have been struggling with a nervous, stupid hen mother whose maternal warmth I had to supplement with jug and hot water bottle. Even with that aid three of her fifteen chicks died from the results of chilling. Another time I shall take her brood away from such a hen at the very beginning.

Hens differ not only in disposition, but in vitality and bodily heat. This hen of mine was a thin little thing, and I doubt if it would have been possible for her under any circumstances to keep 15 chicks warm in our blustery February weather. Had I left her with only the seven she hatched, she would have done better.

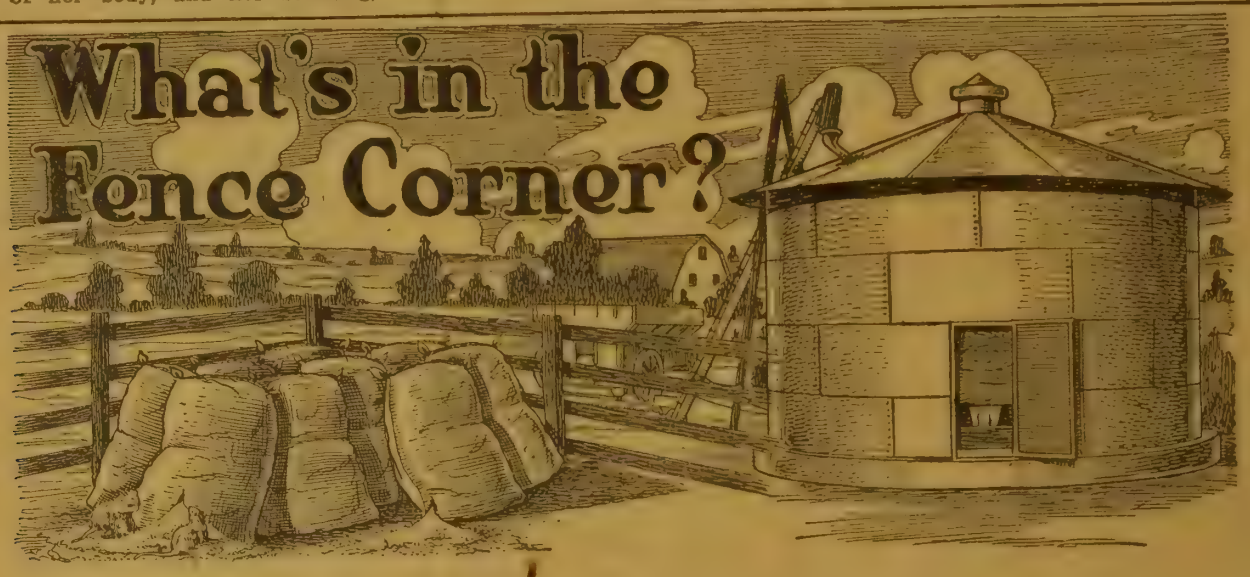
When chicks are brooded by hens they must have most careful protection from wind and weather. It has been my custom to keep every hen mother that hatched in cold, windy or rainy weather in the sunny corner of the feed house for from five to seven days. Here the chicks are absolutely shielded from wind and sudden showers, and I have no fear of their getting out onto the wet ground in the early morning.

A very simple brood coop is found in the back yard of Miss Fanny Crosby of Eagle Rock. Part of the top of the coop is removable and there is a door by means of which the hen and her brood can be confined, while their wants are attended to from above. It is a good plan to confine both hen and chicks in a wire run for two or three weeks. As the chicks grow they may be allowed their liberty, but the hen should always be confined.

Raising Chicks Without Heat

The simplest artificial brooder I have seen recently was in the back lot plant of L. Stratton of Glendale. Mr. Stratton keeps his layers in regular Philo coops, and his chick coops are a modified form of the Philo brooder coop. The Philo coop proper, those who have used them will remember, has a hinged top which is held in place by a prop under which is a movable wire cover, and the combination is a difficult one to manage. Mr. Stratton's coop is a frame 3x4' and two feet high, covered with tarred paper. The top is slatted, and on the slats are laid the piece of tarred paper which serves as roof and a long pane of glass. In warm weather the entire top may be left uncovered. In chilly or wet weather the paper covers all of the coop except that protected by the glass. At all times the chicks are out of the wind, and they get sunlight thorugh the glass until quite late in the afternoon. These chicks sleep in a Philo brooder box, 18 inches square for 50 chicks. I saw chicks just out of the incubator apparently perfectly comfortable in one of these coops in spite of a cold north wind, and chicks three weeks old which had never been out of the coop, of extraordinary size and vigor.

A Semi-Fireless Brooder



C. P. Shaw of Riverside has devised a very clever brooder which is mostly fireless, but utilizes one electric light to raise the temperature slightly at night. This brooder houses 300 chicks and can be built of new lumber at a cost of not over $15. It fronts east, in order to catch every bit of the morning sun, and is eight feet long by six feet wide, with front five feet and rear three feet from the ground. One end, as shown in the illustration, is built against the end of the laying house. The other end and the back are built double, and the space between the walls is filled with dry earth. This not only adds to the warmth of the brooder at night but makes the walls draft-tight. The brooder is divided into six compartments, each consisting of brooder box and run. In the picture four of the runs are occupied, the two end runs being vacant. The glass at the front end of each run admits light at all times and warmth whenever the sun shines. The hinged door above is held at any desired angle by a strip of galvanized iron. The brooder boxes, which are 26 inches long and 16 inches wide, have felt curtains across the front, and are covered by a large quilt which is rolled back to admit fresh air. Above these boxes, in the center, hangs at 32-candlepower electric globe which raises the temperature considerably on a cold night.

Semi-Fireless Brooder
Designed by C. P. Shaw, Riverside.

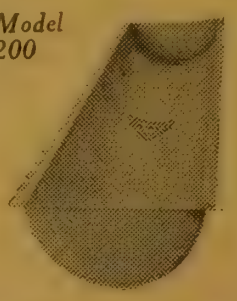
The Electric Brooder

The hot water pipe and stove brooders are being superseded in many localities. This, I am told, is largely because of the poor quality of the gasoline they have had to burn, which makes the hot water brooders in particular very hard to control. I asked C. R. Brown of Arlington, who has just replaced his hot water brooders with one 1000-chick electric brooder, what he considered the advantages of the

IN CALIFORNIA, grain is generally harvested by the combined harvester, which threshes the grain and spouts it into sacks which are then sewed and left in the fields.

Sacks from the harvester remain where they are thrown for some days or weeks; later they are gathered into a pile, usually in a fence corner, where they remain for some time.

But there are other things in that fence corner besides grain. Field mice, rats, gophers, birds—gather in glee. Valuable sacks and more valuable grain is destroyed.



Early rain soaks that fence corner. Sun blisters, thieves invade—and general destruction is in that fence corner with your grain.

Stop that waste—stop that drain on your profits. Install a Calco Metal Grain Bin. Put your grain where it is safe from rats, rain and ruin. Calco Grain Bins are inexpensive, and cost but once. Afterwards they SAVE. They save grain and save money for you.

Get the free booklet, "Calco Grain Bins." Sent upon request.

latter. "I don't know," he replied, "that it is any cheaper or better than some of the large brooder stoves, but it is adaptable to any building. I could not have used a stove in this building, but the electric brooder can be used under a tent or anywhere. It is no more expensive for it cost only $40 to install the 1000-chick size, and ventilation and temperature are both more easily controlled than in other brooders. Then there are no corners to crowd in, for a curtain suffices to keep the heat in. As to whether the chicks are likely to be burned, I have not tried it long enough to say. Adaptability is, however, its main advantage."

Every system of brooding, from natural to electric, has its advantages and its disadvantages, and each depends largely on the intelligence of the man or woman that is running it for its efficiency. Not even the hen can raise a brood without human oversight. Given human intelligence and care the simplest equipment is sufficient.

COMMENT ON ALL-NORTHWEST EGG LAYING CONTEST

By Jean A. Koethen

It is rather humiliating to admirers of other breeds to note how completely the White Leghorn walks away with all the honors. Leghorns made the highest per cent of production, 60 per cent, for the month of January, and did this at a feed cost for the average bird of 29.3 cents, while Rhode Island Whites made only 55.1 per cent production, and did it at a feed cost of 35.3 cents per bird. The feed cost for Wyandottes for the average bird for the month was 31.8 cents; for Barred Rocks, 31.7 cents; for Rhode Island Reds, 31.4 cents; for the three miscellaneous breeds, 30.5 cents, and for Black Minorcas, 31.5 cents. Perhaps the most interesting list of figures is that of return above feed cost. This for Leghorns is 63.6 cents; Rhode Island Whites 50.1; Wyandottes, 53.1; Barred Rocks, 50.7; Rhode Island Reds, 41.5; miscellaneous, 37.4; Black Minorcas, 28.4. From which is appears that a Black Minorca is likely to be but half as profitable as a Leghorn. But this is only one month's record. The high hen for the three months, which produced 74 eggs in 88 days, had a sales value for eggs of $4.01 for the 88 days. She was a White Leghorn.

Exceptional Birds Pay

The return above feed cost for the average Leghorn was 63.6 cents for the month of January, but the return above feed cost for the best Leghorn was $1.106. She was nearly twice as profitable as the average bird. The return above feed cost for the average Rhode Island Red was 41.5 cents, but the return for the best was 98.5 cents. For the average Rhode Island White the return above feed cost was 50.1 cents, but the return for the best was $1.146. This was the most profitable hen in the lot, leading the best Leghorn by 14 cents. The best Barred Rock made a return above feed cost of $1.082; the best Wyandotte, a return of 98.1 cents; the best Black Minorca, a return of 88.4 cents. The selling price per dozen of the eggs for the month was 60 cents, and the feed cost per dozen eggs 18.9 cents for Leghorns, 25.8 cents for Rhode Island Reds, 24.7 cents for Rhode Island Whites, 23 cents for Barred Rocks, 22.4 cents for Wyandottes, 31.5 cents for Black Minorcas. Twelve per cent of the Minorcas and nine per cent of the Barred Rocks laid no eggs at all, while only 1.4 per cent of the Leghorns were in this unenviable class.

Of what use is such a report as this? Just this, I think. It gives the casual reader, who has not time for careful record keeping, an idea of what should be the approximate cost of egg production for his breed. Most of us when we are asked can give little idea of what it ought to cost. We do not know whether we are feeding extravagantly or economically. Many of us do not even know whether we are breaking even or not—we backlotters, I mean. Here we have in black and white what it ought to cost to produce a dozen eggs, and what profit a good layer ought to bring her owner. As for the breed data, no accurate conclusion can be drawn from the figures for a single contest, but take them by and large, they come out a good deal alike the country over.

Will not break

That's a statement that will be clear to any one who examines the construction of the Splitdorf Spark Plug.

Its long life is assured because the insulation (which is the vital feature of any plug) is of imported ruby mica, a material that is *indestructible*.

The mica core of the Splitdorf Spark Plug simply *can't* crack, chip or leak. Therefore, with only ordinary care, it will last practically forever.

When you find SPLITDORF Plugs as regular equipment you'll know that the engine manufacturer is determined to give the purchaser the highest priced and longest lived plug made.

Although Splitdorf Plugs cost the manufacturers more than any other plug they'll cost YOU no more than the ordinary plug. All Splitdorf Standard Plugs, except Specials, $1.00.

There is a type of Splitdorf Plug best suited to every engine. Our booklet will tell you the exactly right type for YOUR engine. Write for it TODAY.

Healthy, hardy chicks—do you know the secret?

WHY, OF COURSE, it's an *open* secret! You can sum it up, and boil it down, in two words: *proper feeding*. And proper feeding is an easy or a hard job—depending upon how easy or hard *you* make it! If, for example, you depend upon Sperry Baby Chick Feed—there isn't anything to worry about. For this perfectly mixed ration makes healthy, hardy chicks—and that's no secret, either!

This explains why thousands of chicken raisers are so enthusiastic about it. They realize that, to make money in the chicken business, they must save a big percentage of each hatch. And, what's more, they have proved that chicks fed from the very start on Sperry Baby Chick Feed develop into sturdy, *profitable* chickens.

Remember—Sperry Baby Chick Feed is *absolutely gritless*. (You should, however, add about 5% fine shell and grit when using.) It contains the food values and constituents which Nature has taught the mother hen to scratch for her baby chicks. It is clean, uniform, properly granulated and proportioned for the delicate organs of the baby chick.

Also remember this: the amount of feed eaten by a baby chick during the baby chick period is so small that the slight difference in cost between poor feed and Sperry Baby Chick Feed means nothing—especially when you realize that the saving of a very few chicks more than makes up for it.

So—why take chances, why experiment, when Sperry Baby Chick Feed puts the whole secret in the hollow of your hand? It is a perfectly *balanced ration* that gives your baby chicks *exactly* what they need.

If you want to know just how to feed your baby chicks for better results and bigger profits—send today for the new edition of our booklet, "Makes Hens Happy." Full of practical hints and profit-pointers! Send for your copy at once—it's *free!* Don't bother to write a letter—simply fill in and mail the coupon below. Do it today—NOW!

CALIFORNIA CULTIVATOR

THE LIVESTOCK and DAIRY JOURNAL Combined with CALIFORNIA CULTIVATOR

Los Angeles — An Illustrated Weekly for the Rural Home and Ranch — San Francisco

Vol. LII — March 29, 1919 — No. 13

50 FARMS at AUCTION

April 1, 1919, 10 A.M.

5-10-20-40-80 and 160 acre tracts

THE PRIEST RANCH adjoining the town of PIXLEY

Vineyard, Orchard, Alfalfa and General Farming Land

WATER CONDITIONS IDEAL

Title perfect and clear of encumbrance. Terms 10% cash and 10% annually until paid. Second payment on improved land due in four months. Payments may be deferred by purchaser making permanent improvements or setting out trees or vines.

Interest 6% payable annually. Discount of 2% per annum for cash at time of purchase.

Several tracts of alfalfa just ready to cut. Majority of land in grain which with seasonable weather will more than make first payment.

New $18,000 school house on land bought off this tract.

Power lines and several pumping plants already installed.

Large ranch house and two bungalows ready to move into.

Graded roads throughout the tract.

Pixley is on the main line of the Southern Pacific Railroad and on the STATE HIGHWAY. It is fifty miles north of Bakersfield, eighteen miles south of Tulare, and twenty miles south-west of Porterville. Take a look at the land before the day of sale.

Sale will positively take place and every piece be sold regardless of price, as indicated by the following resolution passed by the Board of Directors:

RESOLVED, that this corporation, Farm Lands Investment Company, do sell at public auction, without reservation, the tract of land adjoining Pixley on the east, and known as the Priest Ranch, and that the President and Secretary of this corporation be and they are hereby authorized, directed and empowered to sell said ranch at public auction on the first day of April 1919, and generally do all things necessary in the premises for and on behalf of this corporation. Read letters from successful farmers and land owners:

FRANK J. BRUNDAGE.

Farmersville, Calif., March 5th, 1919.

Mr. H. G. Cattell, Pixley, Calif.

My dear Sir:

The Priest Ranch, taking the tract as a whole, I think it one of the best pieces of land in Tulare County for home building and the raising of grain, alfalfa, deciduous fruits and grapes of all kinds; the soil being a deep sandy loam is easy worked at any time and being close to the main State Highway and railroad will make it very desirable for small farms. Anyone contemplating the purchase of land for a home or an investment will do well to investigate your tract before buying elsewhere.

Yours very truly,
(Signed) FRANK J. BRUNDAGE.

Dinuba, Calif., March 3rd, 1919.

Mr. H. G. Cattell, Pixley, Calif.

Dear Sir:

Regarding your land at Pixley, I can say that it is as good as the land at Dinuba. It is simply ideal for alfalfa, grapes, figs and peaches. While it is a pumping proposition, this is more than offset by entire lack of hardpan, uniformly level soil, and freedom from grasses, attending ditch irrigation.

Respectfully,
(Signed) G. W. WYLIE.

TULARE MERCANTILE COMPANY.

Tulare, Cal., March 5, 1919.

Mr. H. G. Cattell, Pixley, Calif.

Dear Sir:

I have been a resident of Tulare for the past twenty-eight years and have long advocated the breaking up of large holdings which in most cases comprise the most desirable lands in the community. This particularly applies to the Priest Ranch, which, I consider, offers exceptional opportunities for the home builder, situated as it is near the main line of the Southern Pacific and the State Highway, it is easily accessible. This is wonderfully fertile soil and will produce almost anything, with water, of which there is proven to be an abundance near the surface waiting for the pump. By seeding, cultivation and energy well directed, there is no reason why this should not be made one of the garden colonies of Tulare County.

Knowing the Priest land as I do, I shall not hesitate to recommend it to the home seeker as being particularly adapted to alfalfa and dairying. I do not believe better land for Thompson Seedless Grapes can be found in Tulare County and for fig culture, one only has to look to lands adjoining on the north to satisfy oneself of the practicability of raising this type of fruit.

Very truly yours,
(Signed) W. A. HIGGINS.

COUNTY ASSESSOR.

Tulare County, Cal.

Mr. H. G. Cattell, Pixley, Cal.

Dear Sir:

The Priest ranch has always been known and recommended as one of the best parcels of land in Tulare County. In looking over this land today I am impressed with what our land could be made to produce with the application of work, water and a little money.

I sincerely believe this land to be admirably adapted to the production of vines, alfalfa, peaches or figs. I believe this land to be just as well adapted to the production of Thompson seedless and Sultana grapes.

I should feel safe in recommending anyone contemplating making investments in this valley to make careful personal investigation of this tract of land. I feel sure that they will be profited by doing so.

Very truly yours,
(Signed) THOMAS H. BLAIR.

COPIES OF LETTERS FROM SUCCESSFUL LAND OWNERS.

Orosi, Calif., March 3, 1919.

Mr. H. G. Cattell, Pixley, Calif.

Dear Sir:

We have this day seen your land at Pixley that you propose to sell at auction.

We consider this land well adapted to alfalfa, vines and deciduous fruits and believe that anyone interested in land of this nature will find it well worth their while to investigate.

Yours very truly,
(Signed) V. E. SLOAN,
W. M. BEINHORN,
W. A. OXFORD,
R. H. ANDREWS.

Dinuba, Calif., March 5, 1919.

Mr. H. G. Cattell, Pixley, Calif.

Dear Sir:

On making a visit to your land southeast of Pixley I found it to be in my opinion better than the average of the land in the San Joaquin Valley.

I have lived in the valley more than 40 years and I think it is especially adapted to certain varieties of grapes, especially Emperors and seedless grapes, peaches and alfalfa, and although it is a pumping plant proposition there seems to be plenty of water. I see no reason why a man could not make a fine home there.

Respectfully,
(Signed) R. M. LEWIS.

FIRST NATIONAL BANK.

Tulare, Calif., March 5, 1919.

Mr. H. G. Cattell, Pixley, Calif.

Dear Sir:

The writer has been acquainted with your large ranch south of Pixley, known as the Priest ranch, for the past 25 years, a wonderful two sections of the very best ground. I have no hesitancy in stating that it will make an ideal colonization for a large number of small farms, the soil is especially adapted for the small rancher in that he may produce successfully diversified crops. Soil, sunshine, and moisture are the essentials of production, you have good soil and warmth and with the moisture within reach through the medium of irrigation, the small farmer controls the situation. Intensified farming with fewer acres better farmed is now the watchword leading to success.

Wishing you every success, I am,
Very truly yours,
(Signed) H. M. SHREVE, President.

California Opportunities in Beef

By R. P. Royce

THE American Shorthorn Breeders' Associations recently issued a list of breeders by states.

California is credited with an even hundred—not bad—but Iowa has 5370 breeders, over 53 times as many as this state. Iowa isn't 53 times as large in acreage or population, neither does Iowa own 53 times as many cattle. Of course Iowa has been in the game longer than California—not 53 times as long, however—but the farmers of Iowa have learned the value of well bred cattle. They have evidently proven to their own satisfaction that there is more money in the better sorts.

In the list of breeders referred to, Washington is credited with 231, Oregon with 205, Nevada with 20 and Arizona with seven, a total of 463 breeders—and if California's 100 are added, 563—which is only about 100 more than is credited to Tennessee or Kentucky.

We have no data relative to the status of the Hereford situation, but there is little doubt that practically the same proportion would hold true, while with the Angus the figures would be even more striking.

The figures just cited should furnish ample confidence to the man who is considering entering the pure bred beef cattle game, and to the established breeder, grounds for the expansion of his operations. Particularly should this apply to California.

There is a vast territory embraced within this state, Washington, Oregon, Nevada and Arizona, that will of necessity always be utilized as cattle range. Then too as the agricultural resources of the states named are developed beef cattle will occupy an increasingly important part. To imagine otherwise would be an assumption for which little or no basis can be found.

Further, to imagine that with each passing year there will not be an increasing demand for better cattle is equally wrong. The movement toward better live stock is as certain and as plain as the coming of night and morning. Perhaps at times it seems that if there is a movement it is very, very slow — in some cases heartbreakingly slow. But the trend toward better live stock is irresistible. It could not be otherwise; the value of the improved breeds is supported by too much evidence.

Western cattlemen have seen how the Shorthorn bull and the Hereford bull have, in a comparatively short time, as such things go, succeeded in blotting out the one time famous longhorns. They have been the chief factors in evolving a better and more profitable type of range cattle, and they will continue to be the chief factors in the future. There exists no more alluring possibility in the live stock world than can be found in the production of pure bred beef cattle in California.

The reason for the statement just made can be found in facts set forth above, but to make the reason a bit clearer it might be well to direct attention to the following:

Geographically, California occupies a strikingly strategic position from the standpoint of supplying better cattle to the great area represented in the five states named. In a way it is the middle ground and is the one state in which can be found conditions paralleling conditions found in each of the states mentioned. Again, as a source of supply for that territory this state is more accessible than any other. There is another and very wide field for which California is the natural source of supply. The Pacific island trade is developing very rapidly and there is little doubt but that the far east offers a field of tremendous possibilities. To the south, the west coast of Mexico, Central and South America constitute a field of operations for our breeders. Study a map of the western hemisphere. Is there any real reason why California produced breeding stock can not find their way to the east coast of South America? The more one studies the situation the more impressed one becomes with the importance of our geographic location.

Wonderful Ranging Opportunities for Beef Cattle in California Forest Reserves

But even more important than our geographic location (for buyers have a way of going where good cattle are produced regardless of location) is the proven fact that climatic and feed conditions in California are such that make possible the production of the highest type of cattle.

In most sections of this state, aside from the high mountain ranges of the north, cattle have a twelve month growing year. That is, young stuff does not have to suffer the serious and unprofitable setbacks due to blizzard temperatures. They can be out of doors every day of the year, growing and developing extreme constitution and hardiness.

One of the first facts to impress Eastern live stock men is the unusual size they remark in our live stock that has been properly developed. The writer has on many occasions heard leading live stock judges comment on this point, and on one occasion he heard a nationally known authority make this statement: "California live stock producers have not as yet begun to realize what a wonderful advantage they have over breeders of other sections. I have never seen any section where live stock is produced where I believe more size for age can be developed than on the Pacific Coast. It seems to me that here one finds to a high degree every condition necessary for the production of all kinds of live stock of an extremely high character. With such natural conditions there is no reason why this state can not be made a great live stock nursery and if California breeders will grasp their opportunity and bestir themselves in the matter of establishing herds of the first rank they can be certain of attracting the best trade of the world."

Quite recently we made note of the fact that a carload of California Berkshires had been shipped to an eastern state. Now, if California breeders can produce Berkshires of such high quality that buyers will cross the continent for them, is it not reasonable to assume that breeders of other kinds of live stock can likewise produce a quality of stock that will be sought after by the best breeders?

So far the dairy interests of this state have made more progress than the beef interests. Some of the greatest dairy animals in the world were bred and developed in California. And in the case of one breed of dairy cattle the statement may be made with assurance that beginners or established breeders do not find it necessary to pass by California herds when in search of a herd bull. They can find what they want, either from the standpoint of individuality, breeding or production right at home. Furthermore it is definitely known that some of the leading breeders of the East are casting their eyes toward California.

Continued on Page 457

More Beef Herds for California

By Gordon H. True, Professor of Animal Husbandry, U. of C.

Professor True probably has as intimate acquaintance with the beef industry of the state, and the West in general; as any man. For a number of years he was identified with live stock interests in Arizona. Later he was in charge of the animal husbandry department of the University of Nevada. Since coming to California his work has been of a most conspicuous character. Professor True believes that this state has a wonderful future in meat production. He bases his opinion on his observations made throughout the great live stock producing centers of the United States, and upon observations made last summer in the Pacific Islands.

It was due to True's enthusiasm that the University of California was induced to exhibit fat stock, steers, wethers and barrows, at the 1916 and 1918 International Live Stock Exposition at Chicago. The accomplishments of these exhibits are too well known to recount, but the statement may be made that nothing has served to so well advertise the live stock possibilities of California.

CALIFORNIA and her neighboring states comprise a region that undoubtedly furnishes more advantageous conditions for the production of high class breeding stock than any other part of the United States. The comparison has often been made between this region and the British Isles, the home of practically all leading breeds of meat making animals, not to the disadvantage of this coast country. That the live stock industry has not been developed to anything like that of other leading live stock states is California's misfortune. Other forms of extremely specialized agriculture that have been most highly developed are beginning to look toward an accompanying development of animal industry as a means of maintenance of soil fertility.

The markets of the coast have not in the past been such as to encourage the production of high class market animals. The high prices prevailing at the present time, without a corresponding increase in cost of production, have practically opened an eastern market for the best of our product so that the wider spread in value between low grade and high class market animals is offering a new encouragement to the stockmen to improve the quality of their product.

Never was the outlook for the future of the cattle industry better than at the present time. Especially is this true in the case of the pure bred end of the business. There is a prevalent notion among some people that the raising of pure bred live stock is principally a fad for the rich. While this may be true in the case of some individuals, by far the largest part of any breed is in the hands of the comparatively small breeder whose living is made from the sale of pure bred animals for the improvement of grade stock raised for market. That pure bred industry thrives the most in which the largest percentage of the herds are of this character.

California with a beef cattle population of probably 1,700,000 head has less than 10,000 registered animals of all ages and breeds. The writer estimates that this vast herd requires the use of 75,000 breeding bulls, of which number one-half to one-third need to be replaced each year. If one-fourth of the animals in the pure bred herds are breeding cows raising calves regularly they would furnish but 1250 head per year as their contribution toward the annual demand for 25,000 to 30,000 in the range herds of the state. A consideration of these figures should convince any man that the raising of pure bred bulls for the range should be a profitable undertaking.

It is largely for the purpose of encouraging new breeders that the breed associations of the state have adopted the policy of holding public sales such as those to be held at the University Farm on the 8th and 9th of April. Few men desiring to start in the pure bred cattle business by the purchase of two or three females feel that they can afford to travel about the state from herd to herd for the selection of foundation stock. Auction sales furnish the opportunity for selection and purchase without this expenditure in time and money for travel. California breeders have been very insistent that their sales shall be conducted in the interest of the purchaser and such animals are offered as they feel sure will give satisfaction in the hands of the buyer. The continuance of the sale system also insures the beginner, who may otherwise find difficulty in marketing a small number of head, a ready means for getting his cattle on the market. Live stock sales have come as a legitimate part of the general movement for the development of the industry of the state, and for those who do not contemplate purchase they furnish—like the live stock shows—one of the best means of education to be had along this particular line.

It is significant that the California Cattlemen's Association, which has been organized for the development of the market industry, should plan to hold its meeting in conjunction with those of the breed associations at the time of their annual sales.

Agricultural News Notes of the Pacific Coast

Northern California

Eldorado County is making a fight for better highways.

Some early potato planting sections have entirely finished planting of Garnets.

Marysville, Butte County, proposes to hold a tractor show some time during April.

Some Butte County producers of Adriatic figs report receiving as high as 12½ cents.

The Sutter County grand jury charges the state reclamation board with incapacity.

Marysville, Yuba County, has a community council, aiding in locating returned soldiers.

Sonoma County grape growers are considering advisability of grafting wine grapes to currant grapes.

The Gridley Cannery picnic which has been an annual feature for the past 23 years will be held this year on June 14.

Growers of peas near Hayward, Alameda County, have perfected an organization which has aided materially in securing better prices.

What was probably the greatest live stock event on the Pacific Coast was the Guaranty Sale in Sacramento on Thursday of this week.

Rice growers are killing ducks and saving crops. The state fish and game commission insists that it must not be done out of season.

The spring rains have not been heavy, but so perfectly distributed that grain and every other crop is looking exceptionally well.

The Sacramento and San Joaquin drainage district in its Sutter Basin flood control has made certain concessions which it is asserted will lessen opposition.

The authorities of the Plumas National Reserve will establish a community range for the coming season in order that owners of small herds may combine and secure pasturage.

In the Sacramento County Cow Testing Association a registered Holstein of Fred Kiesel topped the honor roll with 2578 pounds milk, 94.9 fat. Kiesel's herd of 67 cows averaged 30.7 pounds fat.

Cattlemen of Shasta County report this one of the best seasons for mountain ranging of many years. One ranger, with 400 head of stock, did not lose a single animal in the mountain pastures.

The grape growers have deferred circulating petitions in the matter of referendum on adoption of prohibition amendment. They will now include all prohibition laws enacted by the state legislature.

Dean Van Norman of the University Farm, in an address before a milk producers' convention at Boise, Idaho, recommended an advertising or educational campaign to inform the consuming public of the real value of milk and milk products.

The directors of the various county farm bureaus in the northern part of the state plan a statewide traveling farm bureau conference to be held from March 26 to April 4. The start will be made from Alameda County, traveling south through the San Joaquin to Los Angeles and Riverside Counties. Reports of delegates will be made to April meetings of the farm centers.

Central California

A county weed drive is planned by Stanislaus.

Modesto's first fat hog auction was held on Friday the 14th.

Prof. Bioletti recently gave pruning demonstration at Kearney Ranch, Fresno.

The California Fish and Game Commission is to establish a hatchery on Kaweah River.

Stanislaus County's rainfall prior to the last week's precipitation was about nine inches.

The Southern Valley Honey Producers Cooperative Exchange has been organized at Hanford.

Kings County creameries disbursed $218,000 to farmers of that county during the month of February.

Stanislaus County fat hogs recently commanded $16.75 for toppers, with other sales running down to $14.85.

Growers of canning peaches of Stanislaus County have decided to pool their interests in marketing of fruit.

The raisin output of 1919 is estimated at close to a quarter million tons by the Associated Raisin Company.

The new law as to ripeness of citrus fruits provides for the eight to one test as to solids and 25 per cent color.

Cotton growers of Central California are getting together and pooling their interests in the endeavor to secure fair returns.

Crop Reporter Risser reports central part of the state sending out the best cauliflower ever, with over half the crop shipped.

Some fig growers are hopeful for a 20 cent price on 1919 Smyrnas and perhaps 15 cents on Adriatics, with 11 for Black Missions.

At the recent annual of the chamber of commerce at Fresno George C. Roeding urged serious consideration of the Pine Flat dam project.

Senator Brown sets up the claim that Sacramento milk consumers who are paying 13 cents should be supplied at not to exceed 10 cents per quart.

One buyer recently purchased $11,000 worth of hogs at a Tulare County farm bureau sale. The toppers commanded $16.10. The bottom price was $14.80.

Irrigators near the Turlock district who are on colony ditches are starting movement to have these ditches taken into and become a part of the Turlock district.

The first three year period of the California Peach Growers, Inc., ends on April 1, but the corporation has the option of extending the original contract two years longer.

Inspectors working under direction of the Cattle Protection Board in Kings County met at Hanford last week to get a thorough understanding of their duties. Their work began March 10.

In order that the paving of the 18-mile stretch on the ridge route may be completed, the state highway commissioners are considering closing that portion of the valley highway for a period of about nine months. It has been estimated that two miles of paving a month can be successfully handled. If the road is closed all travel north and south will be detoured through Bouquet canyon.

Southern California

Farmers at Perris have organized a chamber of commerce.

Hemet walnut growers have shipped their last car of the season.

Southern California will plant more extensively to chayotes than any preceding season.

Coachella made trial planting of rice last year and this year will make larger plantings.

The larger part of the olive crop of Santa Barbara County has been salt cured this season.

San Fernando Valley, Los Angeles County, has 800 acres prepared for cantaloupe planting.

The Brawley district, Imperial County, is shipping something over 100 cars of lettuce weekly.

"Save the irrigating water by putting it into the soil", is the slogan in many producing sections.

The Hemet cannery of the California Growers Association handled a large pack of olives this season.

San Diego County shipped about 30 cars of spinach this year. Cannery demand has been lighter than usual.

Ventura County bean growers are feeding Blackeye beans to hogs because of quotations reaching $3.00 to $3.10.

Palo Verde Valley, Riverside County, has shipped over 8000 bales of cotton. The total production will be approximately 13,500.

Potato planting is generally much lighter than last year, though it is reported that California is reaching nearer to normal acreage than Eastern sections.

Residents of Ventura County in certain sections of improved highways are taking steps to prevent high speeding autos near schools. There have been fatalities resulting from carelessness.

The Anaheim Citrus Fruit Association has finished on Navels and all varieties of oranges excepting Valencias and is now planning for a great association picnic to be held some time in May.

A combination or pool of independent bean growers and shippers with the California Bean Association will result, it is hoped, in moving last year's crop of beans and at a fairly satisfactory price.

The Elsinore Valley, Riverside County, Growers Association recently met in annual session, with 35 stockholders present. The association still has 15,000 cases of canned goods, or approximately 15 cars.

Orange County farm bureau has now established headquarters in large and commodious rooms in which are gathered data and exhibits of interest to producers. There is a library, rest room and other desirable features.

The first and second plantings of cucumbers in Southern California were generally a failure because of the cold preventing germination. The third planting is now up and doing well. Shipments, it is estimated, will begin early in May.

The last storm gave a precipitation of from half an inch to an inch in most Southern California producing sections. This, with the inch and a half to two inch storm of the few days preceding, gave Southern California assurance of a successful season.

The Coast and General

Salt River Valley, Arizona, is planting 600 acres of watermelons.

The Hawaiian Islands are up to date with cow testing associations.

Considerable quantities of bass and other fish are being taken from Roosevelt Lake, Arizona.

Utah farmers have found excellent results from the feeding of beet top ensilage to horses.

The growing of sisal for its fiber is one of the most lucrative industries in British East Africa.

An irrigation development is planned near Pocatello, Idaho, which will cover 1,200,000 acres of land.

A large plantation of 18 varieties of eucalyptus is being made on the island of Oahu, Hawaiian Islands.

The Arizona Bankers' Association has voted $500 as a fund for prizes to stimulate interest in farm club work.

Australia proposes to eradicate wheat weevil. Warehouses will be cleared of the pest by creating a heat of 140 degrees Fahrenheit.

One of the largest saw mills in the United States is being built at Cooley, at the end of the new railroad from Holbrook south into the big pine forest of Arizona.

Alberta, Canada, is shipping great quantities of cattle over the line into the United States. Scarcity of feed and high prices over the line is the cause of the movement.

One of the creameries in Phoenix, Arizona, will finance a number of farmers in the Casa Grande Valley, 50 miles south, in buying dairy cows.

The state will complete the financing of the Lyman dam project on the Little Colorado in northern Arizona. Original estimate of the cost of the dam was $150,000, but increased cost of material and labor will increase the cost to $250,000, it is said.

The legislature of Nevada has enacted a law prohibiting the employment of alien labor by the state or any county or city in Nevada. Employment of such labor may entail a fine of from $100 to $500. The governor has not yet signed the bill.

Lieut. Thomas Maddox, recently returned from service in France, has been appointed state engineer of Arizona. It is now believed that from various sources there will be a considerable amount of money available for road building the coming year.

Ramsey Patterson, a hunter employed by the United States Biological Survey, recently killed in Yavapai County, Arizona, what is claimed to be the largest mountain lion ever known. The animal was 10 feet from tip to tip and thought to be 50 years old.

Hiram Shouse, a 17-year-old boy of Mesa, Arizona, is the champion boy cotton grower of this state. He grew on one acre of land 2,479 pounds of seed cotton, or more than a bale and one-third of lint cotton. The cost of growing the acre was $106.98 and his net profit was $289.66. Duncan Brown, also of Mesa, raised 1,185 pounds of seed cotton on one-half acre at a cost of $54.80 and a net profit of $182.51. Another Mesa boy, Wendell Butler, raised 1,062 pounds of cotton on one-half acre at a cost of $50.98 and a net profit of $155.98.

There Are Many California Ranches on Which Small Herds of Pure Bred Beef Cattle Will Prove Highly Profitable

Shorthorns in California

By B. O. Cowan

THE history of pioneers, whether men or cattle, is an interesting one. There is always a sentiment and oftentimes a romance that make plain facts fascinating. The early settlement and subsequent development of California is so fraught with romance and tragedy that any story concerning it has more than a passing interest. But this story is not of the men who made the glories and possibilities of California known to the world, but of a breed of cattle that has contributed no small part in the state's past development and that gives assurance of still greater aid for the future.

The Shorthorn breed of cattle had its origin two or three centuries ago in England in the counties of Durham, Lincoln, York and Northumberland. An early name of the breed was "Durham," and they were also called "Teeswater Cattle" because their native habitat was the valley of the river Tees. As these cattle were improved and refined by careful, painstaking husbandmen they came to be called Shorthorns in distinction from a breed called Longhorns. The first importation of Shorthorns to America was made about 1790 when a few were landed in New York. During the first quarter of the next century large importations were made in Ohio, Pennsylvania and Kentucky and from these commonwealths their descendants were taken to other states and thus marched westward with Empire.

The earliest record of Shorthorn blood being introduced into California was in 1852. In that year Nave and McCord, wholesale grocers of St. Joseph, Missouri, sent a wagon train across to California and with the train they sent some grade cows and a roan Shorthorn bull. To save the bull unnecessary travel he was not driven with the cows, but was led behind a wagon and got through the long journey in good condition. At Marysville, California, he was sold and he made such a marked improvement in the cattle of that community that he was long remembered by ranchmen.

The Blood of An Aristocrat

Ringmaster, one of the most popular Shorthorn bulls ever shown in America. The blood of this bull is represented in the offering to be sold at Davis, April 8th.

The earliest record of the introduction of recorded Shorthorns, of which I have knowledge, was 1857. In that year W. D. M. Howard brought to San Mateo some Shorthorns bought in New York, and they furnished the foundation for an extensive herd afterward maintained by the Howard Cattle Company. This herd was dispersed but three years ago, following the death by accident of Edward Howard, a son of the founder of the herd. In 1859 Shorthorns were brought from Onondago County, New York, by Egbert Judson of San Francisco, and in 1861 Robert Ashburner imported the bull Water Prince 13112 from England and landed him at the Golden Gate. Mr. Ashburner later located at Woodland, where he bred Shorthorns until his death about ten years ago. In 1860 John D. Patterson, Westfield, New York, shipped some sheep and a few Shorthorns from New York City to San Francisco by sea, driving them across the Isthmus of Panama and reshipping on the Pacific. The very high transportation charges made such shipments impracticable, but as Mr. Patterson desired to stock his ranch in California he decided to try an overland shipment and drive. In 1861 he sent forward 20 Devons, 50 Shorthorns and 600 sheep. They were shipped by rail to St. Joseph, Missouri, the western railroad terminus at that time, and were then sent by boat to Nebraska City and from there were driven to Sacramento. The train had eight wagons and 30 men and started from Nebraska City May 1, arriving in Sacramento October 28. During this long, tiresome journey one-third of both cattle and sheep died, supposedly from inhaling dust and drinking alkali water. The story of this disastrous drive I had from a man who went with the cattle.

During the next 15 years shipments of Shorthorns from states in the Mississippi Valley were numerous and many new herds were started in California. As indicating the size of some of these herds, it can be said that Coleman Younger of San Jose had 70 head recorded in a volume of the herd book that was issued in 1872. And as evidence that some choice Shorthorns were being brought into the state, Thomas Page paid J. H. Kissinger, Clarksville, Missouri, $1800 for the noted show cow Caroline Airdrie at a public sale held in 1871.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Cattle are increasing on the thousand hills of California and in her valleys are adding wonderfully to the state's prosperity. Of the beef classes the Herefords and the Shorthorns are favorites, but there is an occasional Aberdeen-Angus and Galloway and a very few Red Polled. We are glad to give this week on the leader page views which are an inspiration to live stock lovers, and especially to give the magnificent view on the cover page.

FARM BUREAU TREK

Delegates from various farm bureaus are enjoying a most practical institute and trip this week. After meeting at University Farm and Berkeley they are now on their way south. On Monday Los Angeles County farm bureau and Mrs. Anita Baldwin will entertain the delegates on the Baldwin ranch. Live stock judging features, luncheon and other instruction and entertainment provided.

A UNION STOCK YARD?

Speaking of live stock markets, we are reminded of an advertisement offering stock in a proposed packing plant and stock yards to be built at Sacramento. The advertisement was for the purpose of announcing the general aims of the concern, and as noted, drew attention to the fact that the general public was to be permitted to buy a limited amount of stock.

In reference to the possibility of profits the statement was made that "The packer gets his profits be the price high or low"—As much has been suspected. What the average producer wants is some system whereby he can do as well!

The statement is also made that in connection with the plant there will be a union stock yard. We are almost tempted to ask: "Wha'd'ye mean union?" Our idea of a union stock yard is a yard adjacent to and surrounded by killing establishments—not a yard adjacent to and in connection with a single plant. Of course such a yard could be made to operate as a union yard if other buyers would come to them for their buying—but would they? Is it reasonable to suppose that Bay killers (most of the killing is done in the Bay region) would fall very hard for such a plan? If the yard furnished competition then it would be expected that the nearby plant would only have to "hike the ante" to a fraction above what the Bay buyers could afford to pay. In view of the fact that the out of town buyers would have to reload and reship they would most assuredly have to buy at a margin that would permit them to compete with stuff laid down at their home plants that had not been subject to reloading and reshipping charges.

We believe in the efficiency of a marketing system built around a regulated union yard, but we do not believe that Sacramento is the logical place for such a yard.

VICTORY LOAN SLOGAN

We did not give last week the address of the Victory Loan Committee's headquarters to which the slogans competing for prizes should be sent, and several subscribers have mailed to this office. These have been forwarded. Those sending other slogans should address Room 524 Merchants National Bank Building, Los Angeles, or Victory Loan Headquarters, San Francisco.

ROCKING THE DAIRY BOAT

The Cultivator believes in cooperation on the part of producers. We believe that only through legitimate cooperation can producers hope to get a fair and square deal. We recognize the fact that, unorganized, the producers are at the mercy of organized agencies that handle their product. We have seen how effectively certain producers' organizations have handled their products. We know that these organizations have been effective. Therefore we see no reason why the milk producers can not effectively organize and handle their products to better advantage. And for that reason we have watched with interest the fight that is centering around the milk producers' associations. So far we have adopted a "hands off" policy, believing that when several thousand practical dairymen unite on a common cause, the chances are they are right. A few men may make mistakes, but a large number—rarely.

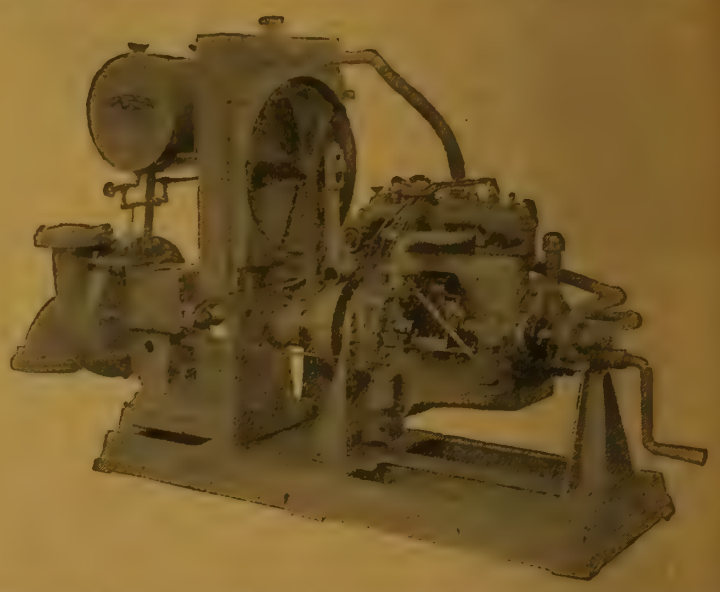
Since the inception of milk producers' organizations in this state, there has been a powerful force, backed by those interests that profit most in an unorganized industry, straining every nerve to wreck the new launched craft on the rocks of public opinion. It was but natural that such opposition should develop. The milk producers effected their organization to protect and transact their own business. If they were to accomplish their ends the interests that would be affected most seriously would be the privately owned plants. This being the case is it unreasonable to suppose that those interests would leave the field without a struggle? One of the most effective ways of combating the new organization would be to discredit them in the eyes of the public. And the most effective way to do this would be to make the public believe that the sole purpose of the producers was to organize so strongly that they could dictate an exorbitant price of milk, and it is quite certain that the general public will stand most any advance on commonly used commodities with less hullabaloo than the advance of a cent or two, or even five cents, on the price of milk. Each new advance is seized upon by newspaper space writers as a basis for a sensational story on the high cost of living and they delight to point an accusing finger at the dairyman and hold him before the public a gross profiteer—citing the fact, usually, that he rides in an automobile!

Not long ago a state senator made the charge, on the floor of the senate, that back of these producers' organizations was a deep laid plan to sell them out to a Chicago packer. Perhaps an effort to cause dissatisfaction within as well as without! It struck us at the time that such a charge was perfectly idiotic. Now comes the president of the affiliated milk producers' associations, who was charged with being an active partner of Armour, and he denies pointblank every charge and states that he is not, never was and never will be a partner of the Chicago packer. We take him at his word, no proof to the contrary being offered.

Since the original charge was made, other charges relating to mismanagement have been brought in in an effort to create dissatisfaction among the association members.

To all these charges we are inclined to pay small attention. Dairymen need not get panicky—no one will "sell them out". No man or set of men could—even if they wanted to. There are a lot of brains among the producers—keen, practical brains—enough to head off and squash any such Don Quixotic plan.

We make no doubt but what the various associations, through their representatives, have made some mistakes—in any new proposition as large as this organization mistakes are bound to be made. Again, among several thousand men will always be found a few disgruntled souls who can not be satisfied—who are suspicious and who are apt to lend themselves to the aid of the opposition.



Some have been inclined to question the alleged overhead expenses, and have raised the question, in an insinuating way, as to what was to be done with "all" the money that was poured into the treasury. Without attempting to fight the association battles or to defend them, we would like to point out that a large working capital is needed and that the early expenses incident to setting such a large proposition on its feet are necessarily seemingly high.

As we have stated above, we have no doubt but that occasional mistakes have been made, but we believe that the idea back of the association is sound and in the end will work to the advantage of both the producer and the consumer—the charges of the privately owned plants to the contrary notwithstanding.

Apparently, the lusty milk producers' association is going through a spell of "growing pains" aided and abetted by those interests that would profit most through its demise. We expect it to pull through and eventually accomplish its object—that of making dairying more profitable. We respectfully suggest that the various officers strive to correct any weak points in their operating plans. If the plan fails it will fail because of bungling guidance and not because the idea is unsound.

Producers must recognize the fact that the organization is not to be used to continually boost the price of dairy products—supply and demand will largely regulate the price—but rather as a stabilizing factor. Profits can be increased by cheapening the cost of production and distribution and the association should adopt a broad plan—should educate the producers to the possibilities along these lines.

ECONOMICAL AND EFFICIENT

BEAN UNIVERSAL PUMP

DIRECT CONNECTED TO MOTOR

It's BEAN QUALITY through and through. If you need a portable pumping plant or a stationary unit that will deliver your water supply at a small cost—and keep on delivering it efficiently and economically, investigate this pump. We manufacture and sell

Horizontal and Vertical Centrifugal Pumps, Deep-Well Turbines, Direct Connected Outfits

(Both Engine and Motor Driven)

Tell us your pumping requirements and let our pump specialists advise you. Fill out the following. There's no obligation.

1. I wish to pump.....gals. per minute.
2. Suction lift?.....ft.
3. Discharge lift?.....ft.
4. Source of water supply .....

Name .....

Address .....

Bean Spray Pump Co.

SAN JOSE, CAL.

Investigate Our
Complete Line of

Commercial Fertilizers

of our own manufacture, all organic, under the following brands:

"Banner" Brand

(Guaranteed Analysis)

Nitrogen, 4.00 per cent; Phosphoric Acid, 7.00 per cent; Potash, 1.00 per cent.

"Reliable" Brand

(Guaranteed Analysis)

Nitrogen, 3.00 per cent; Phosphoric Acid, 3.00 per cent; Potash, 1.00 per cent.

We respectfully solicit inquiries and will be pleased to mail booklet upon request.

Southern California Fertilizer Co., Inc.
602-610 Kerckhoff Building, Los Angeles
Broadway 1381 Telephone, Home 60329

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste—(Atomic Sulphur)—and for dusting.

For Lime Sulphur Solution, use our DIAMOND "S" BRAND refined Flour Sulphur. We can furnish you this sulphur at such a low price that it will pay you to mix your own solution.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our diamond "S" Brand Powdered Sulphur. Write direct to

San Francisco Sulphur Co.
524 California Street, San Francisco, Cal.

We are equipped to make immediate shipment. Send for illustrated booklet; price list and samples, and please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Tel. Kearny 871.

Ask the Man Who Has Used It

Whether or not he has made good crops with Nitrate. Why speculate with Non-Nitrated forms of Nitrogen when, by using Nitrate, you can insure crops against adverse conditions? With the rational use of Acid Phosphate, always recommended by us, there will be no interference with normal soil conditions, either in one year or in one hundred.

Dr. William S. Myers
Chilean Nitrate Committee
25 Madison Ave. New York

JUSTICE IN TAX ASSESSMENTS

THE situation of the bean growers because of the great depreciation in value — and even inability to dispose of the crop at any price—is now further complicated by the fact that immense stores of beans are held subject to taxation because of being in the possession of the farmers on the first of March. Ventura County bean growers are taking steps to secure justice in the matter of assessed valuation, as is indicated by the following letter which was written by John Eastwood of the Oxnard farm bureau center to members of that organization:

"I wish to call your attention to a situation in which it seems to me that it is not only the privilege but the duty of the farm bureau to take some definite action. It is in the matter of the coming assessment valuation to be placed upon our holdover beans.
